Engraving on Copper.—Artists practised in this branch of science are fully aware of the difficulties that, as it were, compromise all works of art, which, after they have been used for some time, require to be retouched. Those inconveniences have been experienced to their fullest extent in the labours of the topographical map of France. The fact is, that a sheet raised at the 40,000th may be placed in the hands of the artists who are required to engrave for the 80,000th, and then at least two years of preparatory labour become necessary: the work of the engravers requires from five to eight years, with a cost of from 1,200 to 2,000 francs, so that when the copper-plate is completed at a heavy expense, an interval will have elapsed, since the last works on the ground, of ten years, and frequently more.—And still, as it has been remarked by Marshall Vaillant, in a note addressed to the Academy of Sciences, the objects which ought to be represented by the engraving in a topographical map are not always as invariable as a painting. The rectifications of roads, the opening of railways, the digging out of canals, the efforts of industry, and administrative modifications, bring about continual transformations, which the map ought to produce, under penalty of being looked upon as old at the period of its birth, and of becoming useless on the very day of its being distributed to the public. Thus, at the moment when the plates of the map of France appear, it will be requisite to change them; and, from the times of activity and mobility in which we are now living, corrections become necessary at least once a year. Up to the present period, these changes were executed solely from time to time and under the pressure of absolute necessity. For the future they will be effected by a new process, without delay, without trouble, and almost without expense; and this improvement in the art is due to Mr. George, an engraver in the war depôt.

As we cannot here enter into the technical detail of this new invention, we may say that it consists in an extension and perfecting of the galvanoplastic process, which has been already introduced into the reproduction of the plates of the map of France.

By the aid of this improvement, the corrections are confined to the defective spots; the false features are replaced by a metal brought into union, without any force or violent blows, without any general alteration of the plate, and which adheres in a perfect manner; the burin is not required to re-engrave the part which was good at first; the time and the expense are reduced to a minimum, and corrections of every kind will for the future be looked upon as operations as sure as they are easy, in all descriptions of engraving.

Mr. George (we may rely on his minister for the facts) has thereby rendered a great service to the war depôt, to topography, and to the art of engraving on metals, whatever may be the applications of it.

The Red of Adrianople.—Some important researches of industrial chemistry on the oils necessary for the fabrication of the Adrianople red, have led M. Pelouze to conclude "that these oils are mixtures of neutral oils with fatty acids; and that similar oils are equally adapted for producing the red of Turkey, either by the spontaneous acidification of the oils in the presence of the matters which accompany them in the grains, or by the direct mixture of the neutral oils of commerce and the fatty acids, particularly the oleic acid, resulting from the manufacture of stearine candles."

"It is extremely probable," adds M. Pelouze, "that the treatment of certain oils, and more especially of rape oil, by some hundredth parts of their weight of sulphuric acid, would give birth to mixtures of neutral oils and fatty acids, which, when properly washed, might be adapted to the fabrication of the Adrianople red.

THE CITY AND ITS STRUCTURES.

Every great city is characterised by its public buildings, more than by the style of its private houses. Whatever the condition of Rome, so long as the shrines of Peter and the other patron saints may stand, it will be sacred, for the dignity of successive empires and popedoms is consecrated by genius in alliance with high art. Cæsar, Trajan, Constantine, and the pontiffs, acquired power, wealth, and absolute dominion. Pliny, Tacitus, Buonarotti, and Raffaelle, with the poets and painters, upheld all that can endure of their glory.

All the principal Italian cities possess such monuments for perpetuity. Venice, notwithstanding the prostration of an age, is still magnificent in her decadence: nearly the same may be said of Florence, Milan, Bologna, and others. The no less valuable but more able performances of high art, in paintings, sculpture, and of perfectioned taste, may be transferred; but the structures which it took ages to accomplish must remain so long as matter endures; and these, while they breathe, for they do breathe, will record the fame of their projectors, and instruct posterity in arts to be lost no more.

Our London, too, has treasures already amassed sufficient to qualify a claim to the same distinction: the vast and the magnificent may not belong to her edifices so truly as the ornate and the elegant. St. Paul's is fairly entitled to both; the old Abbey and the new Palace of St. Peter fairly realize much of what human skill, taste, and science, can accomplish. We have, however, many structures, little noticed, never boasted of, which, not being colossal, are little observed in the multitude of churches. A passer by occasionally glances at St. Mary-le-Strand: he exclaims, sometimes—pretty! occasionally—beautiful! But that is the foreigner. How rarely is it asked,—Who is the architect? How few could answer,—James Gibbs! So of others in our daily walk. We ask not in St. Marylebone who designed their handsome parish church: there is no inscription (visible) to record the fact that it was Thomas Hardwick: the entablatures of Roman remains are inscribed, "Imp. Cæs. Div.;" but the names of the real founders, of those who planned and executed the achievements, are lost. This was not so in ancient Greece, for their architects and sculptors were (amongst them) hyper-canonized: they were reputed demigods. If there is no Pantheon *here*, nor niches reserved for the heroes of art, there ought to be an entablature in imperishable bronze, to preserve the name of the originator.

It is impossible to particularize the names of all the artists that abound in this great metropolis; still the auto-registration recommended would in future evidences assure the old dictum, "By their works ye shall know them."

We can stand the test of comparison with most capitals as to the number of churches, fine public buildings, and monuments contained within the precincts of the old city, which might, on that account, be deservedly designated "La sancta Civita;" but when we scan more closely the huddled position of some, partially, very meritorious sacred structures, we find the greater part stand between two houses of business, sometimes in close connection with mercantile stores—the monitor clock projecting from the house of God—the crane and its pendent hook from that of Mammon! The temples indicated are familiar (as to their externals) to the merchants of 'Change: who knows anything of the in'ernal arrangements?

Often have those who glide down the stream, in the *Daisy* and *Forget-me-Not*, felt happy in the contemplation of the varied spires and steeples which afforest London's fog. There is a glory in their fantastic aspirations, of which even Britons may feel proud. The ever graceful Bride's; the rival Bow; the four-pointed gloomy Dunstan; and then the nameless perforated spires that hold guard in conflict round St. Paul's. Is it possible to fancy for a moment that all these shall ever be swept away? To do so would be to desecrate the nation. Let the steeples stand.

Towering above the smoke, the majestic dome of St. Paul's is visible from all parts, and when there is sunshine, its gilded cross glitters in state, as seen from Leith-hill, twenty-five miles in a right line. This edifice is not, perhaps, so gorgeous as St. Peter's, as to the interior, for there we have no mosaic designs, nor the costly marbles, nor the numerous excellences of art so abundant in Italy: but we have a *unity* of exterior which no building of its kind, not even St. Peter's, possesses.

Sir Christopher Wren struggled hard to insulate his buildings. He succeeded so far as St. Paul's is concerned, and by the purchase of a house in advance, he brought St. Mary-le-Bow out to the street range. He, too, had his opponents and his detractors! in the work which occupied nearly all his life: there were found those who were base enough to *publish* that he protracted the labour in order to reap the advantage of a miserable salary of 200*l.* a year (equal at that time to about 500*l.* of our money). In our own day there are some who grudge to a distinguished architect the fair professional returns of his vocation: the British Parliament can never be obnoxious to such an imputation!

There are, besides the churches, many other buildings which boast of excellences, as well as many which reflect no credit upon either founders or architects; and those least seen and least known have much to recommend them. One of the most prominent, the Mansion-house, which ought to be a model both for exhibition and study,—one, too, which occupies the very centre of the City,—has least of all to claim admiration. It was begun in 1739, and finished in 1753; and although Lord Burlington sent in a design by Palladio, the plan of a shipwright was adopted, whence comes the Lugger character of the style, two stories being superimposed on the cornice, giving it the character of a mansion, with residential chambers above, and a festive temple below, the basements being rusticated donjoned, parted in cells, and grilled!

Not apprehending the merits of Palladio, a *common* councilman asked, "Was he a Papist?" The aspersion could not be denied, and the wardmote carried it in favour of the naval architect.

Enlarged principles and more enlightened views suggested the selection of a more competent architect for the Royal Exchange, now pre-eminently the most important performance within the City. This building would be anywhere illustrious, and for the sake of convenience to the negotiators in universal transactions there, it is to be hoped that the great quadrangle may be inclosed by a glass roof, so as to shield merchants from the vicissitudes of climate, and to guard the interior, which is ornate enough for a grand chamber, from spoliation by the London atmosphere.

To allude to the public buildings, good, bad, and indifferent; or to the foundations, old and middle-aged, would be more than this whole paper could admit of; but, as a general observation, it is apparent that, with the exception of the old Tower, the India House, and the Southsea House, all the metropolitan structures are too much congested and compressed together.

London now comprehends the whole region between Greenwich and Hampstead,—between Hammersmith and Hackney. The intervals are filled in with four and six roomed cottages and factories. They have all a common centre, common sewage, common gas and water mains, and a common polity: should they not have common protection and privileges in common?

There is in the City, doubtless, much to be done, but has not the Town, which is ten times the extent, much which calls for modernization! There, too, many parts need amendment, and very many liberties need conservation: nothing but unity of action, subordinate to *professional competency*, can effect this.

In the old fastness the line of Farringdon-street and Smithfield, &c. &c. remains in abeyance: in the *alentours* Hampstead-heath is threatened with inclosure and excision; and then the sewage—then the Thames embankment and quay-walls—then the bridges; to say nothing of the conservancy of the Thames and the Commissions of Oyer and Terminer. It is too much for a small knot of commercialists, already too busy in individual callings.

As to the continuation of Farringdon-street, that causeway running towards Islington offers an opportunity for a grand issue from the City,

direct from Blackfriars-bridge. The old arena where Bartholomew Fair was formerly held has been long opened, and forms a noble street; but the continuation northward is designed to be only half the width; and a stack of two houses has been erected which blocks off the view at Holborn-hollow, barely revealing a narrow aperture. This is not wise. A beginning ought here to be made of a Broadway worthy of the time and occasion.

It is amazing that lodgings of the poorest kind being so dear in the centre, this fine situation has not been long ago allocated. More may be made of the space by giving a liberally wide street, and by building, as elsewhere, larger houses, than by narrow stinted lanes and miserable tenements. A reference to Victoria-street, or to the new causeways of the West-end might elucidate this point better than argument.

Although only one metropolis, the Town and the City are obviously distinct and opposite in character: the marked features of both may be hereafter blended under common observations.

FOREIGN ART INTELLIGENCE, &c.

The Effigies of General Washington.—M. F. de Lasteirie has published on this interesting subject some remarks worthy of notice. One of the marble busts of Washington was made by the Italian sculptor Joseph Ceracchi, a zealous Republican and friend of Canova, who undertook the busts of all the great founders of American liberty. After many fates, it has been now deposited in one of the villas on the Hudson. Another bust of Washington, not less esteemed, is by the sculptor Mr. Hamilton. But most regarded is the fine statue made by Houdon. Having come to America with Franklin, he was introduced by him to the President, from whom he obtained several sittings at Mount Vernon. The statue, completed in France, is now one of the chief ornaments of the capitol of Richmond, Virginia. The bust made by Flaxman is not without merit, but cannot claim the merit of an original.

Monument to Arnold Winkelried.—Gigantic Rock Sculptures.—The Government of the Swiss Republic has directed that a monument should be erected to Arnold Winkelried, who for the sake of breaking the power of a forest of Austrian spears levelled at the Swiss at the battle of Morgarten, advanced single-handed, and, by burying a number of spears in his body, opened a street to his countrymen. The idea of M. *Schlött*, of Basle, has been accepted by the committee, which consists of a huge rock sculpture, like those of Egypt, India, &c. It represents a Swiss warrior lying slain on the ground. Upon him, as it were, lies the noble peasant Winkelried, the Austrian lances in his breast. Mortally wounded, he yet turns towards his people, inciting them to strive. And, indeed, a youthful warrior, the sword high in air, rushes into the opening made by the hero's deed, and portends a happy issue to the great battle. The monument will be placed on a fine, quiet, arboured meadow (*Matte*), through which runs a clear brook of water, on this side of Stantz, coming from Stantzstadt. For additional pictures, a huge hall, to be erected in the vicinity, will afford sufficient space.

Stuttgardt. New Buildings.—In this part of Germany building is carried on very energetically. The principal is the exterior of the Royal Library, counting 400,000 volumes. Two new wings, built of stone, will be added towards Archive-street, and then the building towards Neckar-street will be replaced by one of greater architectural beauty. The Museum of the Fine Arts had been erected with the view of further extension, which has become now necessary, as the King has added to the collection the Venetian Galleria Breganze.

Prize Competition.—The Academy of Sciences, Belles Lettres and Arts, at Bordeaux, has proposed a prize gold medal of 300 francs for the solution of the following question: "Inundations and their causes; the means of preventing them, with an especial application to the *bassin* of the Garonne."

Magdeburg. Restoration of a Mediæval Statue, 1,000 years old.—There stands on the old market-place of Madgeburg—the statue of Emperor Otto the Great, almost 1,000 years old, beside which are the statues of his two wives. Remarkable for their great antiquity, and as they have withstood even the destruction of the city in 1631, they are undergoing a thorough renovation.

Brussels.—Monument to Dierick Martens.—M. J. Geefs, the famous sculptor, has just concluded the statue of Martens, who first introduced the art of typography into Belgium. He printed first in 1473, and died in 1534, in Alost, where a tablet had been erected to his memory.

Right-Royal Liberality.—The late Baron Sina, a native of Greece, and of humble extraction, has left 1,000,000 of drachms (at 10s. a piece) to his fatherland, to be expended in the following manner:—540,000 drachms to be spent in the erection of a building for the Academy of Athens, the plans of which have been already made by M. Theophilus Hansen, of Vienna, the architect who erected the Otto University and the Observatory in the Greek capital; 200,000 drachms are to be capitalised to increase the salaries of the professors at the Academy; 60,000 drachms for the completion of the Cathedral of Athens, &c.

The newest Works of A. Wolff, of Berlin.—This artist has been ordered to make a *pendant* to the Amazon of Kiss for the second platform of the staircase leading to the Museum. After a labour of several years the clay model has been, at last, exhibited. It represents a buoyant young warrior, with a spear high in air, on the point of inflicting from the height of his spirited horse the finishing stroke to a wounded lion. In a year more the plaster of Paris model will be ready for the casting in bronze. Another work of Professor Wolff is to be executed in marble, after the model of clay now completed. Two genii support a figure in a flying position. The group, of life size, will form a bronze candelabrum for the palace of Remplin, in Mecklenburg.

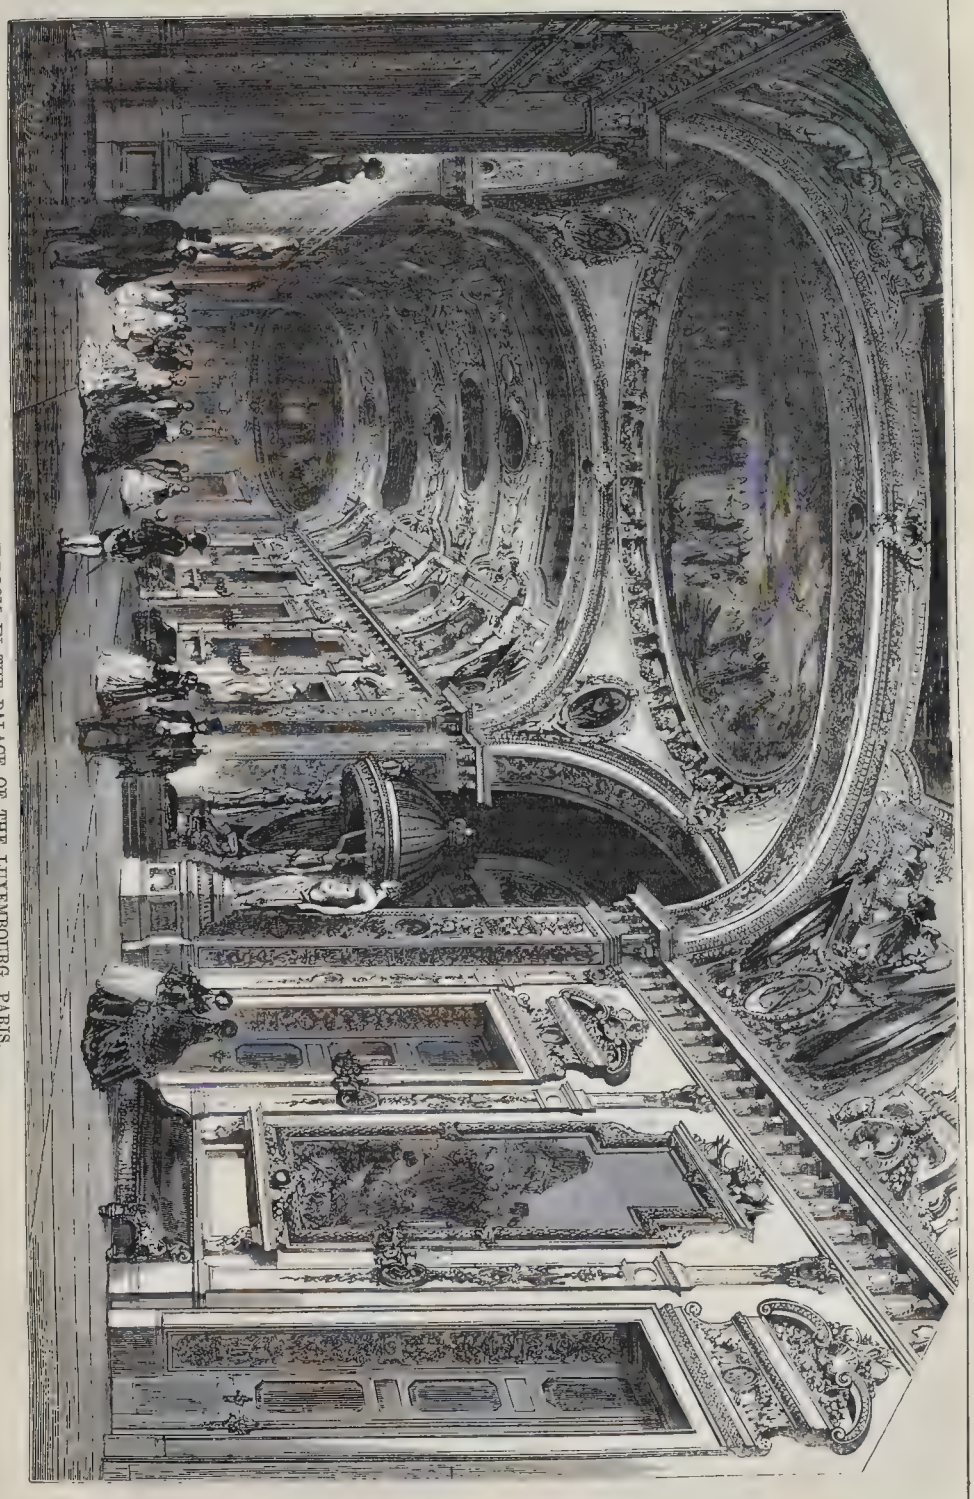
Freemasons in Turkey.—It is only lately that it has been ascertained that there exist in Turkey Mahomedan Freemasons, very analogous to those of Europe. These so-called *Beklashi Dervishes* were hitherto considered as a prohibited religious sect, and their property confiscated. Some steps have been now taken by our Turkish brethren to have these restrictions rescinded in consequence of the new *Hatti-Humayons*.

PECUNIARY AID TO STRUGGLING WORKMEN.

There are striking differences in the social condition of working men resident in cities and large towns, and those in villages and small market towns. The former are exposed to contingences, from which the latter are exempt. The fluctuations of trade, in what are called the "seats of industry," inflict an amount of social misery scarcely conceivable, and the struggles and miserable expedients resulting from extended periods of enforced idleness, have the most injurious and deadening effect upon the moral and intellectual character of the man. In large towns it is not an unfrequent case for a mechanic to be without employment for one, two, or three months at a time. He wanders about day after day, an unknown "unit in the mighty throng," and when night comes returns to his anxious wife and family, foot sore, and heart sick: food must be had, the weekly rent must be paid. He has not, like his brethren in the country, a patch of garden-ground, or the run of one belonging to a sympathising friend,—but for every morsel of food money must be forthcoming, and in thousands of cases there is only one resource,—the pawnshop,—and that is a degrading one: a man with any sensibilities, cannot enter one of these establishments without a sense of degradation clinging to him. Society generally, is little aware of the extent to which these places are frequented, and the vast sums paid by the working classes for pecuniary accommodation,—sums amounting to more than 300,000*l.* it is said, per annum.

We are disposed to think, indeed, that this estimate is much below the reality, some shops taking three or four hundred pounds per day! so that we shall not be far wrong, if we say the working classes of London pay not less than half a million of money annually for pecuniary accommodation. That a large proportion of this is paid by the reckless and improvident is perfectly true; that much of it might be avoided is true; but it is quite as true that many are, from such circumstances as we have named, or the illness or death of a wife or child, absolutely compelled to procure temporary accommodation at a most exorbitant interest,—an interest so pressing, that in nine cases out of ten the unfortunate pledger, after paying interest for a few years, until he has paid more than the original sum, loses all hope of ever redeeming them, and resigns his property, for which he only received about one-third its value.

Is there no possibility of establishing a loan society for the advance of small sums to working men of good character? Could not something of this kind be done on a similar plan to Arneway's Charity, with the difference that the money should be repaid by weekly instalments? If a few benevolent and wealthy individuals were to advance a sufficient capital to establish such a charitable loan fund, the borrowers to pay a sufficient interest to cover the expenses of management, it would, under careful and judicious supervision, become a powerful instrument in inculcating a spirit of independence amongst the working classes. Of course such a society would be open to imposition; but if charity is to stay at home until no impostors are to be found, why, we may as well hold our peace at once about elevating the working classes. What we want to see is, that the means for *self-elevation* shall be placed within the reach of the labouring classes. We do not believe in any plans for improving the condition of the workman, which are to be carried into effect without an effort on the part of the parties to be benefited.



Again. How often do opportunities present themselves to men, which, if they could raise a few pounds, would place them beyond the fear of want. Many an honest industrious man has missed such an opportunity for the want of a sympathising friend, and he has gone on toiling to the end of his days; whereas he might have placed himself in such a position as would have enabled him to spend the declining years of life in peace and comfort. We know that some would say, if working men neglect to make provision for these contingencies of life, let them suffer the consequences: there are men who by manual labour have, without assistance, placed themselves and families in circumstances of comfort: and if one can do it, why should not another? Such parties are ignorant of the education and the training of the working man, of his trials and his temptations; but we are not desirous of superseding such praiseworthy efforts. We are asking, that the man who has slipped down, shall have a chance of rising and recovering his social position. The elevation of the working classes is a problem of vital interest to society, and demands the consideration of all.

NEW THRONE-ROOM IN THE LUXEMBOURG PALACE, PARIS.

In 1611, Marie de Médicis purchased the Hôtel de Luxembourg, and employed Jacques de Brosse to construct there the palace we now see. The works occupied from 1615 to 1620. Most visitors to Paris will remember the saloons in this palace appropriated to works of modern artists.

Under the present Emperor of France that part of the State known as the Senate has held its sittings here, and various improvements and additions to the building have been made. Among these is the new Salle du Trône, just now finished, of which we give an engraving from a drawing made for us on the spot. It is an apartment of very considerable length, elaborately ornamented.

Works at Shoreditch Church.—We are asked to say the architect was Mr. Knightley, not Kneightly.

NEW THRONE-ROOM IN THE PALACE OF THE LUXEMBOURG, PARIS.

CHURCH-BUILDING NEWS.

Horsham.—The ancient parish church of St. Andrew, Nuthurst, near Horsham, has been partially restored, and entirely reseated with oak; a new oak pulpit and desk by the Wood Carving Company placed under the chancel arch on the north side, and the communion enclosure paved with Minton's ornamental encaustic tiles. The church is now about to be considerably enlarged westwards, and a turret, to contain a peal of three bells, surmounted by a spire covered with oak shingle, is to be erected upon the roof, with the main timbers springing from stone wall shafts inside. The roof of the nave will be waggon-headed, boarded with oak boarding, and divided into panels by mouldings, with carved bosses at the intersections. The windows will be glazed with cathedral and white glass in patterns. The work is to be carried out to correspond in every respect with the old building, the style of which is Decorated. Mr. James G. Smither, of London, is the architect, and Mr. Dewdney, of Horsham, the builder.

Margate.—The cemetery for Margate is progressing towards completion. The site is at a short distance from the town on the Minster-road. The boundary walls enclose eight acres, which are being laid out, from the designs and under the superintendence of Mr. Cormack, of Southampton. The two chapels (Episcopal and Dissenters') are in the Early English style of architecture, of Kentish ragstone, with Bath stone dressings, and the roofs covered with ornamental tiles. The lich-house is of same description. The lodge at the entrance is a red brick building, also covered with ornamental tiling. The entrance-gates will be of mediæval ironwork. The front boundary wall is to be a dwarf brick wall, surmounted by ironwork resembling the gates. The whole of the works are being performed by Mr. E. W. Smith, of Ramsgate, and it is expected that the cemetery will be ready for consecration in the beginning of September.

Salisbury.—The chapter-house of Salisbury Cathedral has been restored, as a memorial of the late Bishop Denison. Mr. Clutton, of London, as our readers know, was the architect employed. The work first done was the enlarging and strengthening the buttresses, so as to allow of the removal of the iron tension-rods, which were a great disfigurement to the interior. The central pillar has been taken down and rebuilt, and the decayed stone-work, Purbeck marble shafts, and sculptures below the bases of the windows, restored. Care has, it is said, been taken to retain the original features of the building, and not to retouch any of the old work, but simply to replace the parts broken away. The funds at the disposal of the committee have not enabled them to carry the decorative part of the restoration beyond the polychromy of the vaulting and the polishing of the Purbeck marble shafts. The works thus far executed, including a mosaic tile pavement which has been laid down, have entailed an outlay of 4,821*l.* 10s. 10d.; and as the amount of subscriptions received is 4,586*l.* 14s. 5d. the expenditure has exceeded the receipts by 234*l.* 16s. 5d. The works which are still required to complete the restoration are, the restoring of the vestibule, the entrance doors to the vestibule from the cloisters, the stained-glass windows, and the polychromatic decoration of the arcades, and of the sculptures above them. Of this last, a specimen has been finished, the traces that remained of the original decoration having enabled the artist (Mr. Hudson, who executed it gratuitously) to reproduce the colours. It is estimated that the works remaining to be done will require an additional outlay of 3,000*l.* Mr. White, of Vauxhall-bridge, was the contractor, and Mr. J. B. Philip the sculptor.

Bristol.—A memorial window has been erected in the Elder Lady Chapel, Bristol Cathedral, on the north side, facing College-green, by a few friends of the late Canon Harvey. There are seven medallions, set in the cusp foliage of the period, on very light glass, after the manner of the five sisters of York, representing some of the chief miracles of our Lord. At the bottom of the window is the inscription.

Stafford.—St. Chad's Church, says the *Staffordshire Advertiser*, has been re-opened after having been partially restored. The chancel was the first part commenced upon, and on the plastering being removed on the north side, and the brickwork broken through, a Norman arcade of six arches was discovered, and although dilapidated from neglect, and mutilated by portions having been destroyed to make room for the brick casing, they were still in such a state as to admit of their being restored to their original condition. Above the arcade were found the remains of a string course, with the zig-zag moulding upon it, and two single-light Norman windows, all of which were very much decayed, but capable of restoration. On the south side of the chancel a similar arcade, and remains of Norman windows, and piscina were also found: but the arcade and windows were in a much worse condition than those on the north side. The arcade had been nearly all cut away, as had also the windows, two plain stone windows having been inserted in their place. These parts have all been restored, a new three-light east window of stained glass, the gift of Mr. Justice Williams and Miss Clarke, having been put in, and the Norman windows also filled with stained glass, the gift respectively of Mrs. Barlow and Mr. R. W. Hind. The whole has been re-roofed, and the floor of the chancel laid with encaustic tiles. The interior of the tower has been repaired, the Norman capitals of the columns of the east archway restored, and a new belfry floor and ceiling put in. The walls of the nave, which to all appearance were nothing better than plain bricks plastered over, were found, when stripped, to enclose some Norman work, and proved that the church formerly included side aisles. The north and south walls were found to contain each four Norman arches, one of which, on the south side, has been restored. Clerestory windows were also found above the arches, one of which has been restored, and the others laid bare for future restoration. On the plaster ceiling of the nave being knocked down, an oak timbered ceiling was disclosed to view, all in good preservation except the boarding, which has been replaced. The nave has been fitted up with open seats, free, oak reading desk, and lectern, and a pulpit of Ancaster stone. Provision has been made for lighting the church with gas. The work of restoration has been carried as far as the funds subscribed would permit; but the committee have also in view the immediate repair of the buttresses of the tower, and the re-erection of the south transept, which will require a sum of 500*l.* beyond the amount for which they have already rendered themselves liable.

Colwich.—The parish church of Colwich has been restored and reopened. The entire fabric has been put in repair, and the tracery restored to the windows. The ceiling of the old building has been removed (except that of the north aisle of the nave, which presents an unsightly appearance), and a new ornamental open roof, covered with tile, substituted. All the pillars of the church have been rebuilt from the foundation, and the interior has been fitted up with new solid oak sittings, including accommodation for the poor. Rather more than 2,100*l.* have been expended in the restorations and additions (including two grants from the Incorporated and Diocesan Church Extension Societies), the principal portion of which has been raised by the parishioners.

Loughborough.—The foundation-stone of the cemetery chapels for this town has been laid. The site of the cemetery is on the road to Leicester, about a mile from the town, and contains about seven acres. The chapels are divided by cloisters or groined archways, a vestry being provided at the porch of each. The centre archway is surmounted by a tower and octagonal spire, with carved pinnacles, the height of the spire being about 90 feet. The chapels stand upon a terrace at an elevation of about 2 feet, approached by a road 15 feet wide. There are also two octagonal dead houses, with tool houses, and other conveniences. The ground is entered by a pair of gates of iron and wood. On one side is a lodge of red brick and Bath stone facings—and on the other a smaller lodge or waiting-room. The architects are Messrs. Bellamy, of Lincoln; and the contractor, Mr. J. Sudbury, jun.

Mansfield.—The consecration of the new church of St. John took place on Tuesday before last. The church is in the decorated style of the fourteenth century, and will afford sitting accommodation for upwards of 1,000 persons, two-thirds free. The extreme length of the building is 172 feet, and the width 66 feet. It consists of a nave, 57 feet, and two side aisles, 48 feet high. There is a tower at the west end, surmounted by a spire, the whole 165 feet in height, access being had to the belfry by means of a spiral staircase, situate at the north-west angle of the tower. The entrances are on the east side of the chancel, through a porch, beneath the tower on the south side of the building, and a priests' entrance on the west side of the chancel. The walls are composed of Mansfield stone, with Ancaster stone facings. The body of the church is fitted with plain stained deal sittings, with square bench-ends. Provision has been made for an organ on an elevation some feet from the base of the tower. The architect is Mr. Stevens, of Derby. The practical details have been carried out by the following:—Interior fittings,—Messrs. Lilley, of Measham, near Ashby-de-la-Zouch; masonry,—Mr. Elliott, Ashby-de-la-Zouch; and the carving by Mr. Mowsen, of Birmingham. The font is presented by Messrs. Lindley and Son, builders, Mansfield.

Liverpool.—The foundation stone of a new synagogue for the Hebrew congregation of Hardman-street was laid on Tuesday in week before last, with appropriate ceremonial. The edifice is to be erected in Hope-place, immediately to the east of the Hebrew schools. The building, which, along with the site, is to cost 3,100*l.* is to be erected from designs by Mr. Wylie, of this town, and has been contracted for by Mr. Isaac Dickson. When completed, says the *Journal*, it will present to Hope-place a front of Oriental character, a conspicuous feature of which will be a lantern-light of large dimensions, covered by a dome,—interlacing arches forming a predominating characteristic of the structure, and, along with the breaking of the general outline, conferring on it an aspect somewhat Saracenic. —— The foundation-stone of a new Congregational chapel, in Berkley-street, Toxteth-park, in lieu of the Hanover Chapel, destroyed by fire on 1st June, 1855, was laid on Tuesday before last. The building will be in the form of a parallelogram, 81 feet long and 43 feet 8 inches wide, interior measurement. The basement will contain a school and class-rooms, which will have 13 feet clear height, and be lighted with ten large windows. The chapel will be entered by two flights of steps, leading up to an open porch, formed by a large archway: from this the inner porches and staircases give access to the interior. The seats on the ground-floor will be arranged to have a centre aisle and two side aisles, the latter being formed against the side walls. Behind the pulpit is a chancel, containing a gallery for the organ and singers. This gallery will be at a level half-way between the ground and gallery floors. The main gallery occupies two sides and one end of the chapel, and will be supported on oak corbels, built into the walls and resting on iron pillars disposed at a distance of 4 feet from the walls, and continued upwards to carry the hammer beams of the roof, from which spring the arched timbers which span the nave. The roof will not be entirely open, but the upper part is ceiled off, and forms a space for ventilation. The chapel will have no windows under the galleries, except some small star-like apertures in each bay, but will be lighted by twelve tall windows, and one large west window placed above the galleries. A gable will be formed over each window, and thus there will be no eaves gutter over the windows. The front to Berkley-street will be divided into three parts, with two buttresses, terminated above the roof with battlements and crocketed spires, altogether 80 feet high. The centre part of this front will have a large five-light window above the porch-entrance, filled in with tracery of the Decorated period. The whole of the exterior, except the back, will be faced with Huyton wall-stone, and all the door and window dressings will be of white Stourton stone, so as to form a contrast. The woodwork will be stained and varnished to imi-

tate dark oak. It is expected that the building will be completed by next February, and the total cost, including architects' commission, will not exceed 2,500*l.* The architects are Messrs. Moffatt, Smith, and Grundy, of Manchester; and the builder is Mr. Joseph Hughes, of Liverpool.

Pendleton.—The consecration of St. Paul's Church, Pendleton, took place on Saturday before last. The new edifice is in Ellor-street, Paddington, and has been erected in the Early Decorated style, at a cost of 4,000*l.* chiefly raised by subscriptions. The work of erection was commenced, according to the *Manchester Courier*, about this time last year, from designs by Mr. Edwin Hugh Sherrard, of Manchester, architect. The edifice, which is of stone, consists of a nave and side aisles, with pointed roofs, forming nearly a parallelogram. The chancel or principal front, as seen from Ellor-street, says the paper just named in describing the building, presents two gables, the larger roof covering the chancel, and the other the vestry and organ-chamber. Between the two gables rises an octagonal stone bell-turret, 56 feet 6 inches high, crowned with a spire, supported on small stone pillars and arches. A bell, of 4 cwt. is suspended in the turret, cast by Mr. Mears. The large chancel-window faces Ellor-street: it consists of five lights, with tracery in the head, and moulded jambs. The gables and turret are surmounted with stone crosses. There are porches on the north and south sides, but no entrance from Ellor-street. The north side of the body of the church, facing the schools, exhibits the building to the best advantage, there being five large Pointed windows of three lights each, and tracery in the upper part, with buttresses at intervals. The south side presents a somewhat similar appearance. The west end exhibits three Pointed gables, with a window in each. In the interior the nave is divided from the aisles by five moulded Pointed arches upon each side, supported on octagonal columns. The woodwork of the roofs of the nave and chancel is stained dark oak colour, and exposed to view, having ornamental arched trusses. There is a gallery at the west end, opposite the chancel, with seats for 240 children, and having a separate entrance, convenient to the schools, adjoining. The church contains 880 sittings, all low and open, and one-half free.

Lincoln.—The new cemetery and chapels at Lincoln were consecrated by the bishop of the diocese on Wednesday in last week.

Walton.—The chancel of the village church of Walton-on-the-Wolds having been rebuilt by the rector, the Rev. A. Packe, the church was re-opened on 18th ult. The design of the new chancel was furnished by the rector himself, and the work was carried out by Messrs. Broadbent and Hawley. The style is that of thirteenth century; the materials are brick, with stone dressings. Two side windows are filled with stained glass. The altar window is a triplet, and filled with stained glass representing the crucifixion. On the south side of the chancel is a new vestry, approached by a Gothic doorway.

PROVINCIAL NEWS.

Lincoln.—A number of tenders for the erection of a school-house and teacher's residence at Bardney, in conformity with the plans prepared by Messrs. Bellamy and Hardy, the architects, says the *Lincolnshire Chronicle*, were given in last week. The successful offerers are Messrs. Fox and Fotherby. They have contracted for the completion of the buildings at the sum of 620*l.*—this estimate being 100*l.* under the highest which was given in.

Aston (Oxon).—The foundation-stone of the new school-house and teacher's residence in this parish was laid on Tuesday in last week, by Mrs. Adams, wife of the Rev. Dacres Adams, of Bampton. The school-room, which will afford space for seventy-two boys and girls, will be 43 feet by 18 feet; class-room, 15 feet by 12 feet; and the rooms in the teacher's residence will be in accordance with the instructions issued by the Committee of Council on Education. The building will be plain, the funds for its erection being very limited. Mr. James Castle, of Oxford, is the architect, and Mr. Robert Plaster, of Bampton, is the builder.

Lye Waste, near Stourbridge.—Contracts have been signed for the immediate erection in this much neglected district of buildings for the Mechanics' Institute, lately organised here: the plan consists of an octagon reading-room and library, 30 feet in diameter, with top light, two class-rooms, and a cottage. Mr. Smalman Smith is the architect. The fronts of the building will be chromated in character, and executed in the blue, white, and red bricks of the locality. The Right Hon. Lord Ward has contributed 100*l.* towards the erection of the buildings, and other sums have been received.

Wolverhampton.—Mr. Hughes, an engineer whom the corporation of this town employed in the matter of procuring a supply of water for the town, has brought an action against them for the amount of his bill, 1,224*l.* 10s. 1d. and obtained judgment against them (the corporation abandoning the defence) for that sum and costs, in all 1,394*l.* 19s. 7d. But there is no fund, it is said, out of which this amount can be legally paid.

Birmingham.—A concert to test the acoustic qualities of the new Music-hall, in Broad-street, was given by the directors last week. The style of the building is Gothic, of the fourteenth century, and it has been erected by Mr. Briggs, from designs by Mr. Cranston. The decorations of the roof, walls, galleries, and other parts of the building were done by Mr. Whitworth, of Birmingham. The experiment, as far as sound went, seems to have given satisfaction. The least vibration, whether for good or evil, was conveyed with distinctness to the auditory, although a great deal of sound was absorbed by the unfinished and empty organ-case. The new organ, just completed by Gray and Davison, at a cost of nearly 3,000*l.* was to be submitted to the London public on Thursday and Friday of the present week, before being placed in the hall.

Liverpool.—"In obedience to the spirit of centralization," says the *Albion*, "the merchants and brokers of Liverpool are crowding to the neighbourhood of the Exchange, in the vicinity of which splendid piles, chiefly in the Italian style of architecture, are rising in every direction. The natural result is an increase of rents to fabulous prices. A contemporary states that 750*l.* a year have been refused for a floor in the handsome edifice now running up in Water-street; and that a floor in Mr. Bailey's new temple, lower down in the same street, will be 1,000*l.* a year. In the trading streets shop architecture is rivalling, or rather surpassing, in taste the commercial edifices near the 'Change, and Bold-street in a few weeks will be the handsomest street of shops in any city or town in Great Britain. The Health Committee are desirous of erecting splendid public offices in Dale-street, the probable cost of which is set down at 100,000*l.*"

Bootle.—The opening of the United Presbyterian school-room, Derby-road, Bootle, took place on the 24th ult. The schools, says the *Liverpool Journal*, have been erected on a piece of ground leased from the Earl of Derby, on the east side of the Derby-road, near the Mersey Hotel, and consist of school-master's house, large school-room, vestry, library, and session-room. The ground is about 60 yards in frontage, and 34 yards in depth, bounded by an intended new street on the east side. The design is in the form of a quadrangle, the school-master's house and school forming the north flank; the library, session, and vestry forming the east; and the intended new church will form the south flank of the square, leaving the west open to Derby-road. The buildings are in the English Pointed style, from designs by Messrs. Hay; the dressed stone from Mr. Wells's quarry, near Wrexham, and the facing-stone from the Yorkshire quarries, set in courses and clean fractured, without any chisel marks. The school is 74 feet by 27 feet, fitted up temporarily as a church for 400 worshippers until the intended church is proceeded with. The masonry and brickwork were executed by Mr. Wells; the plumbing, painting, and glazing by Messrs. Knight and Son; and the plaster and slate work by Mr. Goodall.

Manchester.—The city surveyor's plans for the enlargement of the gaol have been approved of by Sir George Grey. The enlargement will consist in extensions of the wings for male and female prisoners, with accommodation for warders, provision for an infirmary, additional washhouse room, and a new store for raw material. The wing of the building occupied by the female prisoners at the Hyde-road end will be extended about 160 feet in length, 100 feet in a right line, and 60 feet at a right angle; and will afford cells for 134 prisoners on the silent system. The extension will be four stories high, and uniform with the rest of the building. A similar addition, but in a direct line, will be made to the male prisoners' wing, on the opposite side of the gaol, next the railway, furnishing room for 160 more inmates, and as many cells. A portion of the new building will be set apart for the infirmary. A one-story building, 90 feet by 54 feet, will be erected in the debtors' yard as a store for matting, &c.; and the washhouse will be enlarged to about double its present size. Tenders for the works have been advertised for, and a bond of 3,000*l.* will be required for the due performance of the contract. The estimated cost of the extension is 24,000*l.*——The new road from the centre of Manchester to Cheetham-hill, planned by the city surveyor, is progressing. The extensive works at Ducie-bridge, in the construction of a "high level" viaduct over the river Irk will soon be completed. The viaduct consists of two large arches, bridging the Irk and Walker's Croft, each of 40 feet span, and about the same height from the river and roadway to the crown of the arch. In the construction of the arch over the Irk, says the local *Courier*, an accident happened in the breakage of three or four of the stone corbels, which were built into the side walls to serve as partial supports to the scaffolding. Contrary to orders, these corbels were made the sole support for the heavy woodwork and the superstructure of stone and brick; and the result was that the immense weight caused some of the corbels nearest Ducie-bridge to snap off, and a great portion of the scaffolding was precipitated to the bed of the river. Fortunately the arch was finished, and none of the workmen were injured. In building the second arch the contractor erected adequate supports to the corbels. The roadway here will be ready in two or three weeks, but it will take as many months to complete the stone parapet, and it is not intended to use the road until the whole route is finished, which the Improvement Committee have resolved to effect, if possible, by May next, in time for the opening of the Manchester Art-Exhibition. The work of demolition has been commenced amongst the mass of old and poor dwellings on the south side of Long Millgate, through which the road will pass, cutting into a dense mass of squalid habitations similar to those demolished by the improvements in Charter-street, Cross-street, and other parts of the city.

Huddersfield. — The Milnsbridge Schools, which have just been erected under the direction of Mr. Tarn, architect, were opened on Tuesday before last. The schools are in the Early Gothic style. The principal school is 60 feet long by 30 feet wide, and covered by an open hammer-beam roof, the timber of which is varnished a dark oak colour. The roof is surmounted by a bell turret, 25 feet high, which will also serve as a ventilator. A class-room to hold fifty children adjoins the principal room, and separate lobbies are provided for boys and girls. An infant-school is also attached, 44 feet long by 21 feet wide, capable of holding 120 infants. The master's house occupies the space between the main school and the infant school, and connects the two together so as to form one building. The cost of the buildings, including everything, has been about 1,400*l.*

New Convict Prison at Chatham.—The large new convict prison building at Chatham is nearly completed, and when ready 500 prisoners will be sent there to commence the foundation for the large steam basin and floating docks to be built at Chatham dockyard. The new prison will accommodate 1,000 convicts, who are all to be employed in forced labour at Chatham dockyard.

SCAVENGING THE RIVER THAMES.

"Who shall scavenge the River Thames?" It is a great highway up and down which thousands travel daily. Why should sight and smell be offended by bloated offensive carrion oscillating with the tides in a midsummer sun? Dead dogs, dead cats, and floating offal are not only offensive—they are injurious to public health. It must be the duty of some one to free the river from these horrid objects, just as it is the duty of parish scavengers to cleanse the streets. The conservators, who receive river tolls and dues are the parties who ought to be made to do this work. There should be scavengers' barges just as there are scavengers' carts. All dead animals and floating refuse should be removed regularly from the river at once, and be buried beyond the metropolitan district. The health and convenience will be worth the cost. In the harbour at Balaclava scavenger-barges were established under the orders of the Sanitary Commission. All dead animals, garbage, and refuse were taken to sea and sunk. Whole carcasses were slashed and cut so as to prevent any generation of gases; and, by daily scavenging, the harbour was kept clean and wholesome. We ask again,—Who shall scavenge the River Thames? It should be done at once.

ART-UNION OF LONDON EXHIBITION.

To make our list of the principal works purchased by the prizeholders complete, we give the following:—

From the Royal Academy.—Hampstead Heath, G. C. Stanfield, 60*l.*; Bianca, F. C. Cary, 60*l.*; Sunday Morning, J. Dearle, 50*l.*; At Ghent, A. Montague, 35*l.*; a Mill-Stream, N. O. Lupton, 30*l.*; Haymaking, N. Lupton, 25*l.*; Near Coniston, T. F. Hardy, 20*l.*; A Labour of Love, J. W. Haynes, 15*l.*

From the National Institution.—In the Marshes, G. A. Williams, 60*l.*; A Welch Stile, Bell Smith, 35*l.*; Cottages near Pyrford, F. W. Hulme, 35*l.*; Faith, Jno. G. Naish, 35*l.*; Moel Siabod, F. H. Hulme, 35*l.*; Morning on the Thames, G. A. Williams, 20*l.*; The Burnie Side, Bell Smith, 20*l.*; A Bright Day on the Thames, J. Dearle, 20*l.*; September, A. J. Stark, 20*l.*; At Laindon, Essex, J. E. Meadows, 20*l.*

From the Society of British Artists.—Loch Long, G. Cole, 100*l.*; The Weald of Sussex, G. Cole, 75*l.*; St. Goar and Goarhausen, P. Phillips, 25*l.*; The Gloveress, J. Kyd, 15*l.*; The Undercliff at Eastweir Bay, J. J. Wilson, 15*l.*; The By-way, W. W. Gosling, 15*l.*; Near Criner, G. Stubbs, 15*l.*; On Hampstead Heath, A. Collins, 15*l.*

From the British Institution.—Clovelly, J. Webb, 35*l.*

From the New Water-Colour Society.—On Craig-y-Barns, J. H. Mole, 60*l.*; Near Denham-bridge, P. Mitchell, 25*l.*

The Exhibition will be opened to the subscribers and their friends on Monday next, in the Suffolk-street Galleries, and will be found an interesting one. Tickets may be obtained, free, by any lovers of art, on application at 444, Strand.

AUSTRALIAN NEWS.

The Cathedral of St. Francis Xavier, which the Roman Catholics are erecting at Adelaide, is designed, according to the *Adelaide Observer*, on the model of Byland Abbey Church, Yorkshire, in the Early English style of architecture. The entire length, "when the cathedral is completed," will be 180 feet by about 60 feet wide, and it will consist of entrance porch, with tower and spire, which will be about 200 feet high; a nave and side aisles, divided by cluster columns, with basis about 3 feet in diameter; a chancel, with a chapel on either side; and a sanctuary. The sacristy will be the eastern side of the building. The height to the ridge over the nave will be 56 feet, and the side aisles will be 30 feet high. Only a portion of the building will be erected for the present, extending from the chancel northwards, about 80 feet, and will cost somewhere between 8,000*l.* and 10,000*l.* occupying two years in erection. The structure will consist of uncoursed stone rubble, with cut stone facings of fine freestone from Teatree-gully. The foundation-stone, from the same quarry, was a fine specimen, containing about 30 cubic feet.

The foundation-stone of the Masonic and Public hall, in Brougham-place, North Adelaide, "one acre westward from O'Connel-street," was, on 29th March, to be very shortly laid with Masonic honours, arrangements having been then about to be made for the purpose.

The materials of the long-talked of cast-iron city bridge over the Torrens were, about that date, being deposited on the northern bank of the river, near the present bridge. A memorial to the Government had been prepared, and numerously signed, praying that the present bridge might be reconstructed at the Paradise-ford.

The lavish expenditure on the late (deceased) governor's five-years' leased house at Melbourne, was still exciting attention, and various new items are quoted, such as 1,036*l.* for painting, papering, and graining; 5,596*l.* for a new range of offices; 2,350*l.* for a new coach-house; 559*l.* for cellars (to hold the sour beer served at the levees, an ill natured fellow remarks); 548*l.* for a new verandah; 2,114*l.* for fences; 3,263*l.* for roads within the premises, and 1,195*l.* for paving; 95*l.* for an additional front door; 123*l.* for a kitchen-range, "complete;" and 133*l.* for cooking furnaces, &c. &c. The governor's income of 15,000*l.* included 5,000*l.* for "house allowance." It is alleged that "the total expenditure lavished on Toorak (the house in question), from first to last, has been over 44,000*l.* which will be lost to the public in five years," and the cost of building a permanent Government-house has yet to be incurred. The "lease," we dare say, is not likely to be renewed on previous terms.

Much interest is excited by the discovery and working of iron ores in Australia. Iron has been discovered in various parts, in immense quantities, and some local companies have commenced operations on a grand scale, which, assisted by powerful machinery from England, it is expected, will prove highly remunerative as well as beneficial to the country.

ST. ANDREW'S PRESBYTERIAN CHURCH, SHEFFIELD.

This church, of which the foundation-stone was laid with Masonic honours on the 10th of July, 1835, by Dr. Hugh Wood, Worshipful Master of the Britannia Lodge, No. 62, is now upon the verge of completion, and was to be opened on the 3rd instant. Messrs. Flockton and Son are the architects. The style adopted is the Geometrical. The building consists of nave, 62 feet 8 inches in length by 20 feet in width, and 52 feet high; side aisle, tower spire, 115 feet high; school-room, 54 feet by 20 feet, with session room over, 16 feet 6 inches by 15 feet 6 inches, and all necessary conveniences. The church is warmed by Sylvester's patent hot-air apparatus, laid down by Messrs. Stuart and Smith. The following were the contractors for the building:—mason, Mr. James Powell; carpenter and joiner, Messrs. Moss and Robertson; plumbers, glaziers, and painters, Messrs. Drury and Smith; plasterer, Mr. G. Taylor; slater, Messrs. Law and Co.; and the carved work has been executed by Mr. James Mowbray. The total cost has been about 3,500*l.* Accommodation is provided for about 550 persons. The fittings have been executed in pitch pine, oiled, sized, and varnished. The roofs are open, and boarded.

BUILDERS' BENEVOLENT INSTITUTION.

The ninth annual general meeting of the friends and subscribers to this useful institution was held on the 31st ult. at the London Tavern; Mr. Charles Lucas, the president, in the chair.

Mr. Lucas having briefly opened the proceedings,

Mr. A. G. Harris (the secretary) read the report, which stated that the subscriptions and donations during the past twelve months amounted to 1,354*l.* 1s. and 700*l.* stock had been added to the sum invested in the Three per Cent. Consols, as follows:—250*l.* stock to the relief fund, and 450*l.* stock to the building fund, making the total amount 5,450*l.* stock; viz. 3,500*l.* to the relief fund, and 1,950*l.* to the building fund. The annual ball, held at Willis's Rooms, again kindly superintended by Mr. Joseph Bird, as hon. secretary, produced to the funds of the institution a surplus of 108*l.* and new subscriptions and donations to the amount of 31*l.* 14s. The supporters of the institution will be gratified to learn that the total amount received from this source alone, since its commencement, is 828*l.* 13s. 4d. The total number of recipients enjoying the bounty of this society is thirty-five; viz. twenty males and fifteen females. The report, after thanking the subscribers for their past exertions, called upon those who had not hitherto subscribed to come forward, and by their subscriptions enable the committee to relieve the deserving and aged tradesman, so that he might end his days contented in the assurance that his former respectability and good conduct in life have, notwithstanding his misfortunes, saved him from the pressure of want and neglect in his declining years. The report, in conclusion, stated that Mr. Alderman William Lawrance had consented to become the president for the ensuing year.

The report having been adopted, thanks were voted to the late president.

Mr. George Bird (in answer to a vote of thanks to the treasurer) said he was not satisfied with what the builders had done during the past year. He was ready to admit that the times had been bad, but still there were many of the larger builders who, he was sorry to say, refrained from coming amongst them. He trusted that he should shortly have an opportunity of telling them so. He had seen many men who had lived in the best of style come to want the means offered by this charity, and he therefore trusted that those who stood aloof would at last come forward and support this, one of the most useful and benevolent institutions of which the metropolis could boast.

The Chairman (in reference to a conversation which ensued, relative to the creation of almshouses, brought forward by Mr. Isaac Bird, for which 500*l.* or 600*l.* are required to raise the amount to 2,500*l.*) said it was a disgrace to the builders that they should be talking of such an amount, while the cheesemongers and other trades had raised most magnificent almshouses, and endowed them. The sum to be expended in the erection of such buildings should be nothing less than from 40,000*l.* to 50,000*l.*

PROFESSIONAL REMUNERATION VIEWED IN A NEW LIGHT.

At a meeting of the Bradford town council, held in July, it was proposed to fix the borough surveyor and engineer's salary, at 300*l.* on which Mr. Rawson "urged that just in proportion as they raised the salary, they diminished the chance of getting a return in work from the officer they appointed; a high salary invariably meaning the least modicum of work in return: the more money a person received the more time he would require to spend it in."

Some persons are very liable, to use a common expression, to measure other peoples' corn by their own bushel. Whether Mr. Rawson has done so or not in this case, it is not for me to say. He will know best. Was he ever on the look out for a situation? If so, did he desire his intended employers to give him a low salary, as otherwise he would not be able to do them justice? We should rather suppose that having been born "with a silver spoon in his mouth," he has, by carrying out his novel idea, by grinding his employed, and reducing their salaries to the lowest possible, succeeded in laying up for himself stores of "worldly treasure," but not in obtaining the goodwill of those who are the victims of his peculiar creed.

The general belief is, that a good article always fetches a good price—that the labourer is worthy of his hire. The oracle of the Bradford town council tells a different tale: according to him, a high salary means little work in return! Oh! Stevenson and Brunel! Knowing that a man possessing just enough to keep life and soul together would have done better service to his employers (since having next to nothing to spend, he would require next to no time to spend it in), than you could, have you not much to answer for? Do not your consciences accuse you of the awful duplicity of which you have been guilty?

Mr. Rawson seems to consider that civil engineers are destitute of all probity and honour,—that after spending the best part of their lives, and considerable sums of money, in acquiring the knowledge requisite for successfully undertaking engineering works, they should feel highly thankful for a mere pittance doled out with a niggardly hand. His estimate of our profession does not tend to advance his own worth in the eyes of right-thinking men.

> "Oh! wad some power the giftie gie us
> To see oursels as ithers see us!
> It would frae many a blunder free us,
> And foolish notion."

Taliesin.

CARNAC IN BRITTANY.

Brittany offers attractions to tourists in search of the picturesque. The Druidical monuments of Carnac, although they have been described by several writers, are comparatively little known. A correspondent of the *Literary Gazette* says, justly,—"The Druidical monument of Carnac must be seen to be fully appreciated. No description can convey an adequate idea of the effect produced by these rude and gigantic blocks, extending in eleven lines along the undulating plain, with occasional interruptions and breaks, for a distance of nearly two miles and a half. It consists of three distinct groups, the spaces between which do not appear to have been occasioned, as in other cases, by the wilful removal or destruction of the granite blocks. I believe they were always thus detached, inasmuch as in each of them the stones increase in size from east to west, until they finally reach those gigantic proportions which baffle all our calculations as to the means by which the ancient Celts or Gauls could have transported them, and finally place them in position. Then the mysterious lines, which, when perfect, appear to have been eleven, suddenly cease, and after a short space again recommence with stones of smaller dimensions, gradually increasing in size until we reach the next terminal point. Another remarkable feature in this monument is, that two of the groups, viz.; the first

and third, from east to west, terminate in a semicircular cromlech, the stones of which appear to have been originally placed close to each other. Many have been now removed, but enough remain to mark the line of the original semicircle: this, however, does not exactly meet or correspond with the two outer rows or lines of stones. The centre group, which does not terminate in a semicircle, is not, however, for that reason less interesting. Here the granite blocks are, if possible, still more gigantic, more unwieldly, more imposing. They stand, too, on a wild heath, and thus produce a more striking effect than those near Menec, many of which are built into the walls separating the small properties and allotments into which the land is subdivided. Two other groups of rows of stones exist to the westward —the one near the village of Ste. Barbe, and another still farther off at Esteven: the latter I did not see. They are very inferior to the groups of Carnac. Some writers and archæologists have endeavoured to show that these five groups belonged to one great temple or monument running across the country in a serpentine line, and thence supposed to be a draconticum, sacred to serpent worship. They also suggest that the monument crossed an arm of the sea near Cherispere, and was thence continued as far as Loc Maria Ker. I do not think there is any foundation for these suggestions. The monuments of Ste. Barbe and Esteven belonged, no doubt, to the same system of temples, but they were never continuous, nor are they in the same line."

Notices of Books.

Elements of Practical Hydraulics for the Use of Students in Engineering. By S. Downing, M.A. London: Longman and Co. 1855.

Hydraulics is the science which treats of the motion of fluids in general, including under that term both liquids and gases; the former being called incompressible or inelastic fluids, as water, and the latter elastic fluids, as air. The present work confines itself to the former, taking water as the most important to the engineer.

In the first chapter is discussed the discharge of water from a reservoir, the surface of the water being at a constant level. If water is allowed to issue from a thin vessel by a simple orifice, without any pipe attached, it is found that the fluid is contracted just above the orifice, and that the quantity which issues is less than would result from calculation, according to the size of the hole: but if a pipe in the form of a truncated cone is attached to the hole by its larger extremity, the flow of water will then be greatly increased.

This conical pipe is termed an *adjutage*, and is of great importance in the case of jets of water. The flow of water over weirs or waste boards is only a particular case of the discharge by orifices in general, the orifice being at the upper part of the reservoir: this subject, therefore, comes under notice in the first chapter.

In the second chapter the water is supposed to have a variable head, which is the more common in practice. The velocity of the issuing fluid of course diminishes with the head of water. The same subjects are discussed as in the former chapter, but the varying height of the surface makes the formulæ more complicated, and demands the use of the differential calculus. We have some excellent practical applications of the several formulæ obtained in these two chapters, which will enable the engineer to use them, although he may not be acquainted with the higher mathematics.

The third and last chapter is devoted to the flow of water through pipes, channels, and rivers; a subject as important to the architect as to the engineer, including as it does the theory of drainage. One of the laws of fluids passing through pipes being, that the resistance is proportional to the surface exposed to the action of the fluid, it follows from geometry that the pipe must be circular, if we desire to convey the greatest possible quantity of fluid with a given area of section: hence the usual circular form of drain-pipes is the most correct.

Mr. Downing's work will be a great boon to the hydraulic engineer, since the subjects are much simplified, and do not demand a large knowledge of mathematics in order to apply them to practice.

Miscellanea.

Proposed Railway from Buntingford. — A meeting was held at the George Inn, Buntingford, on August 1st, to take into consideration the propriety of constructing a railway from Buntingford to Hertford or Ware. Mr. Abel Smith, M.P. for Hertfordshire, in the chair. The chairman explained the great advantage of such railway communication, and his desire to support such a scheme; and having called upon the engineer, Mr. H. P. Stephenson, to state his views, it appeared that the line would be thirteen miles long, with favourable curves and gradients; and that by closely following the valley of the Rib and the surface of the ground, and adopting timber structures, a single line of railway might be constructed at a cost under 6,000*l.* per mile: it was proposed, however, to take a capital of 100,000*l.* Resolutions were passed in favour of the proposed line, and a committee appointed to ascertain the views of the landed proprietors and others in the district, and to report to an adjourned meeting, on August 28th, how far it would be expedient to take steps for the formation of a company to carry out such line of railway.

Concerts for the People.—Some twelve or fifteen years since a regular series of threepenny concerts for the people was established at Glasgow, and proved eminently successful, — thousands literally flocking to the great City-hall, which was usually crammed to the doors. In all probability these concerts still continue, and at all events there are such in many other towns throughout the country; and why London should not have its well established and in every way profitable people's concerts, not only in some one central district, but in many, we have long felt at a loss to conceive. It is with no ordinary satisfaction, therefore, we observe that a series of such concerts has been organized in the Philharmonic Hall, 14, Newman-street, Oxford-street, under the patronage of Viscount Raynham, Mr. H. Mayhew, Mr. Charles Mackay, and other gentlemen interested in the welfare of the working classes. The charges for admission are 2d. for the body of the hall, 4d. for the side galleries, 6d. for reserved seats, and 1s. for stalls. The concerts commence at eight o'clock. There is good instrumental as well as vocal music, and other entertainments are introduced. The series doubtless requires a little outlay at the commencement, and ought to be well supported by the higher classes who fill the stalls and reserved seats; but we have every confidence that once fairly set agoing and fully advertised, these concerts will shortly not only be highly successful, but yield such a profit as will enable the patrons and managers to establish other concerts in various districts of the metropolis. The influence of such amusements in withdrawing the working classes from the public-house and its concerts is most desirable, and we doubt not will effect the object in view.

Sale of Mr. Mare's Ship-building Establishment.— The extensive ship-building establishment and ironworks of Mr. J. C. Mare (bankrupt), the well-known Government contractor of Westminster-bridge, &c. together with the fixed plant and machinery, which occupy a site of upwards of 14 acres at Blackwall, were submitted to public competition last week, by order of the assignees under the bankruptcy, and with the consent of the mortgagees. Many engineers, contractors, and others attended the sale. The auctioneer described the property as covering 14a. 2r. 30p. the principal portion of the buildings being freehold, and comprising foundries, smithies, engineers' shops, &c. and fitted with five Nasmyth's hammers, from 10 cwt. to 5 tons. The recent construction of the works had involved an outlay of nearly 250,000*l.* The biddings were kept up with spirit until they reached 55,000*l.* at which price the whole of this vast property was sold.

The Art-Union at Edinburgh. — In the last report of the Royal Association for the promotion of the Fine Arts in Scotland, it is stated that the committee have much pleasure in announcing that the annual funds are continuing steadily to increase. The amount of the subscriptions last year, which was larger than that of any previous year since 1847, has been exceeded this year by 655 guineas. The sum is 4,938*l.* From the late (being the 30th) Exhibition of the Royal Scottish Academy, and from the studios of five of its members and exhibitors, they have purchased thirty-seven works of art, at a cost of 1,855*l.* These included paintings by the following academicians and associates:—J. Noel Paton, Erskine Nicol, Edmund T. Crawford, James Eckford Lauder, Horatio Macculloch, Gourlay Steell, Arthur Perigal, John C. Brown, James Giles, James Drummond, John A. Houston, and R. T. Ross; and by the following exhibiting artists, whose works held a distinguished position in the Academy Exhibition: — Samuel Bough, Waller Paton, John C. Wintour, Thomas Clark, Alexander Fraser, J. Milne Donald, and Edward Hargitt.

Leeds School of Practical Art.—A lecture was delivered in the Leeds School of Practical Art, last week, by Mr. John White, the newly-appointed master of the school, on the "Importance of Art-Instruction." There was a large audience. Mr. W. B. Denison, chairman of the committee, presided. After giving a sketch of the antiquity and early history of the fine arts, the lecturer proceeded to inquire into the reason why an art of so much importance and usefulness as picture-writing was not more generally studied and employed. The reason, he thought, was, because very few persons learnt any of the principles of the art—nothing, in fact, beyond mere copying. Drawing, however, should surely form a part of the education of every one. Reading was taught as a means of acquiring knowledge; then writing as a means of retaining and extending that knowledge; and drawing should be taught conjointly with the latter, and to the same intent. The difficulty of attainment was one alleged objection, but this was more imaginary than real; for with a proper knowledge of the true principles, governed by well-directed study, skill in art was within the reach of every one who desired to possess it.

Suffolk Institute of Archæology.—The summer meeting of this society was held on Thursday in last week, on which occasion the members and their friends made an excursion on the rivers Orwell and Stour, landing at various places to visit the objects of most interest on the banks. Mr. C. F. Gower, of Ipswich, acted as president for the day, in the absence of the Rev. Lord Arthur Hervey, the president of the Institute. The secretary read a paper on Freston Tower, before leaving the vessel, instead of on the spot. The party then landed at the Redgate Hard, and walked to the tower, noticing in their way the favourite village inn of the artist Gainsborough; and from the tower, through a picturesque park, to Woolverstone-hall and grounds. The company having re-embarked, sat down to a collation on deck, under an awning, and afterwards landed at Erwarton, where they were met by the Rev. C. Berners, the rector, and conducted by him over the church and through the rectory-grounds to the old hall. Some observations on the three earliest monumental memorials in Erwarton Church, by Mr. Edw. Blore, architect, were read by the rector. The company then re-embarked, and returned to Bury.

Jobson's Chair-moulding Machine.—This machine for moulding railway chairs, which, by reducing their manufacture to a simple mechanical operation, independent of all handicraft, ensures accuracy and uniformity, seems to deserve attention. The process is simply the withdrawing by machinery of all the parts of the pattern abutting on the core, after which the pattern can be removed from the sand in the same way as in any ordinary piece of uncored work.

The Sanitary Condition of Bermondsey.— Dr. Challice, the officer of health appointed under the Local Management Act, has just issued his report to the Board of Works, showing the great improvements made in Bermondsey since the awful visitations of cholera in 1849 and 1853 in that district. He says that "the absence of any general sickness, and the diminution of deaths, are remarkable, which must chiefly be assigned to the improvement in the quality of the water, as now it is exercising a salutary influence upon the consumers, and is quite a contrast to the filthy and abominable fluid supplied until lately in this district, which aggravated to a great degree the ravages of cholera among us in 1849. Happily, as regards quality, the evil with us is past; but complaints from numerous parts of the district reach me of scanty supply."

Gas.—It has been resolved to establish a company, under the Joint-Stock Companies Act, for the purchase of the Hertford Gas Works, the present proprietors having offered to dispose of the works to the inhabitants of the town. A committee has recommended that a company be formed, with a capital of 13,000*l.* in 1,300 shares, of 10*l.* each, only 8*l.* per share to be called up. It is estimated that the profits will pay a dividend upon the paid-up capital of 6*l.* per cent. per annum.——The Chipping Norton Gas Company have determined to remove the gas works from the present site, to one between the railway station and Mr. Bliss's new mill. Additional shares of 10*l.* each are to be issued, on which the lessee guarantees dividends of 5 per cent. for fourteen years. The works will be enlarged and built in accordance with plans prepared by Mr. Hedley, of Banbury, civil engineer, and the tender of Mr. A. Kimberley, of Banbury, has been accepted. The new works are to be in operation by the 1st of October next.——The *Independance Belge* states that the omnibuses and diligences in the neighbourhood of Lyons have adopted the use of portable gas, which is carried in a cylinder under the feet of the coachman, and communicates by means of a pipe with a lamp inside the vehicle.

Masters and Operatives.—A blue book, just issued, contains the report of the select committee appointed to inquire into the expediency of establishing equitable tribunals for the amicable adjustment of differences between masters and workmen. A majority of the witnesses examined concur in expressing themselves in favour of the establishment of boards of arbitration between masters and workmen, but they differ as to the constitution of the proposed boards, and still more as regards their jurisdiction. The existing law on the subject of arbitration (the Act of 5th George IV. cap. 96) is examined, and found to be nearly inoperative, as hardly anybody resorts to it, and few are aware of its existence. To obviate objections, it has been proposed to establish in the various manufacturing districts "Courts of Conciliation," like the "Conseils de Prud'hommes," in France. The committee believe that the formation of such courts in the country, more especially in the large commercial, manufacturing, and mining districts, would be beneficial, and suggest the introduction of such a measure as an amendment in the present Arbitration Act, by enabling masters and operatives to choose referees from their own class or calling, equal in number, and presided over by a chairman unconnected with either party, to be elected by the referees. The committee think it would be impossible to give these or any other tribunals any power whatever of forcibly regulating the rate of wages.

The Electric and International Telegraph Company.—At the half-yearly meeting of the Electric and International Telegraph Company, just held, the balance-sheet, for the half-year ending June 30th, was produced, showing the revenue for that period to have been 78,516*l.* 1s. 8d. and the expenditure 53,606*l.* 10s. 2d. leaving a balance of 24,909*l.* 7s. 6d. which permitted the payment of a dividend at the rate of 6 per cent. per annum on the consolidated stock of the company, and left 3,677*l.* 0s. 7d. to be carried over to the next half-year's account. It appeared from the engineer's report, that during the half-year ending June 30th, the telegraph had been extended over 76½ miles of entirely new line, nearly all for railway purposes. The length of wire was 459 miles. The mileage of the company was 5,303 miles, and of wire 28,352 miles. Telegraphs had been constructed on the Perth and Dunkeld, the Nayland Extension (South Wales), the Alton and Ardwen branches (South Western), and Salisbury branch (Wilts and Somerset) Railways. The only commercial work of any importance had been the laying down of a direct wire from London to Hull, *viâ* Great Grimsby, including a submarine cable two miles in length across the Humber. Telegraphs are in the course of erection on the Forth and Clyde Railway, and Wilts and Somerset branch. A communication is also being established between the East and West-India Docks and the London office. Three of the Dutch submarine cables have been repaired, and are now in use. The fourth has been picked up, and is being coiled on board at Lowestoft, and will in a few days be again submerged. The report and statement of accounts were adopted, and a dividend at the rate of 6 per cent. per annum declared.

Sale of the Panopticon, Leicester-square.—Our fear, pretty loudly and not seldom expressed, that the Panopticon, in Leicester-square, would not long continue open under the scheme and management on which it set out, has unfortunately been but too soon justified. The premises, we observe, are now advertised for sale by Messrs. Chinnock and Galsworthy, on the 25th instant, with plant, fixtures, and adjoining dwelling-houses. A sum of no less than 80,000*l.* has been expended upon it and its accessories, and it is conceived that the building might be so altered as to provide a splendid concert-hall on a level with the organ, as well as to enable the original design to be more effectually carried out than it has hitherto been. For a theatre or opera-house it is considered to be well adapted, or at least easily convertible. It is to be hoped that a building on which so much money has been expended will fall into good hands, and be converted to some use for the public advantage as well as that of its proprietors.

Smoke Nuisance Abatement (Metropolis) Act, 1853, Amendment.—By this Act, which received the Royal assent on the last day of the session, the exemption, in the Act 16 and 17 Victoria, of glassworks or potteryworks from its operation, is repealed. All steam-vessels plying between Londonbridge and the Nore, and all public baths and washhouses in the metropolis, are also made liable to the operation of the Act 16 and 17 Victoria.

New Congregational Church, Islington.—On the 5th inst. the foundation-stone of a new congregational church was laid in the Offord-road, near the New Cattle-market, Islington, by Mr. Apsley Pellatt, M.P. for Southwark. Messrs. Lander and Bedells are the architects, and Messrs. Dove, Brothers, the builders.

The Smoke Act at Wandsworth.—Mr. C. L. Francis, cement manufacturer at Nine Elms, was summoned before Mr. Ingham on 28th ult. at the instance of the superintendent of the V division of Police, under the Smoke Consuming Act. Mr. Bodkin appeared on behalf of the Crown, and stated that this was an information against the defendant for having eight furnaces upon his premises without any appliances to consume the smoke. There were eleven furnaces altogether, and there were now only three remaining fitted up with smoke consuming apparatus. A professional gentleman, for the defendant, stated that they had tried every means, but all interfered with the manufacture, and he contended that the Act was not intended to stop trade. The ovens for the baking of the cement had been in existence for fifty years, and there was no other house using ovens for the baking of that particular cement. They had applied Mr. Gray's patent, but it was found that it took off the heat from the cement, which became "soaked" and useless. They then tried Mr. Larkins's, next Messrs. Beaufoy's, the distillers, and had then used Welsh coal,—in fact, they had tried every means they could, such as condensing the smoke, as at Messrs. Cubitt's, &c. and had gone to a great expense, but they could not succeed in their trade if they had to consume the smoke. At Messrs. Cubitt's they manufactured plaster of Paris, but not the cement as manufactured by the defendant. They had written to the Treasury, stating that they were willing to adopt any plan the Government might recommend. He thought that they were entitled to a dismissal of the summons, as they had applied the best practical means to consume the smoke within the meaning of the Act. Finally the summons was allowed to stand over for a month, for the purpose of instituting inquiries as to whether there were any means that could be applied.

Dangerous Buildings at Bayswater.—Mr. C. Reeves, the metropolitan police surveyor, attended at Hammersmith Police Court a few days since, in support of four summonses taken out under the new Building Act, against the owner or owners of four dangerous buildings, near the Duke of Cornwall public-house, St. Colomb-road, Westbourne-grove, Bayswater, for not having obeyed an order of Sir Richard Mayne, that they should be pulled down within seven days. The owners of the houses did not appear. The magistrate made an order for the walls, &c. that were in a dangerous state to be pulled down within fourteen days. In the event of non-compliance, they will be pulled down by the police surveyor.

The Liverpool Timber Trade.—The circular of Messrs. Duncan, Ewing, and Co. states that, "since the 1st of February, the supplies to this port of North American colonial wood, have been brought in eighty-one vessels, viz. seventeen from Quebec, forty-one from St. John, N.B. and twenty-three from other ports, which have occupied a tonnage of 63,819: during same period last year there arrived 103 vessels, the tonnage being 74,863. The average amount for the like time in four years previous to this, has been 70,840 tons. From the North of Europe thirty-seven vessels, 12,718 tons, wood laden, have arrived; whilst, for the like time last year, fifteen vessels, 4,216 tons arrived, the average of four years being 9,150 tons. The supplies of square timber from the North American colonies amount to about an average; but of deals the quantity falls considerably short of an average." The arrivals during the last month from the North of Europe sum up three vessels from Danzic with timber, and one from Sweden deal laden. The importation from the Baltic since the opening of the season gives an excess over an average of years of 3,500 tons of shipping. The circular states that "there has latterly been an improved feeling manifested in the market, both with regard to timber and deals."

Fall of a Gable at Edinburgh.—On Thursday in last week the gable of a house in Leith Wynd suddenly fell in, exposing the interiors of the dwelling-houses contained in no less than six flats. No lives were lost, although every flat was crowded with sleeping apartments thus laid open in the middle of the night.

Purification of Gas by Clay.—Our readers may recollect of our calling attention to a very promising application of common clay to the purification of gas at Wakefield. We have now the gratification of stating that our anticipations have been completely justified by the result of another year or two's experiments, as well those of practical gas manufacturers as of scientific chemists, such as Professors Brande and Taylor, Dr. Letheby, and others. Gas at Wakefield was steadily raised in illuminative power and value from 12½ to 15½ sperm candles by its use. At Huddersfield, where it has also been tried, it was found to remove (as at Wakefield) impurities which lime could not touch, and especially ammonia, so as palpably to increase the brilliancy of the gas. Dr. Letheby and Professors Brande and Taylor, moreover, have found that besides ammonia it separates certain "sulphur compounds contained in gas which lime cannot entirely separate;" and Dr. Letheby expresses his belief that the very noxious bisulphuret of carbon is one of these compounds. Since these experiments have been made, a new sort of proof of the power of clay to abstract ammonia and other ingredients from gas, even already purified by lime, has occurred in the vicinity of Wakefield, where the contaminated or impregnated clay appears to have been found to constitute a most potent manure, producing, for instance, five crops of grass, in one season, so thick in the pile that it had scarcely room to grow; and in other instances, where it was used in a certain quantity for the purpose, utterly destroying all vegetation where so used, while producing luxuriant crops in the same field where used in small and properly proportioned quantity. Indeed, no one who ever smelt the strongly offensive clay of our streets when impregnated by impurities from our "purified" gas, can doubt the power of clay to withdraw such impurities from gas, or even its power as a manure. The clay in the Rev. Mr. Bowditch's patented process, we may add, is used alternately with lime in gas purification.

Asylum for Fatherless Children. — The foundation stone of this building was laid on the 5th, on a piece of land between the Croydon and Stoat's-Nest Stations, on the London and Brighton Railway, by the Lord Mayor. It will have a frontage of 350 feet, and a depth of 200 feet. It will be Italian in style, constructed of freestone, with dressings of Devonshire marble. Mr. Moffatt is the architect, and the contract has been taken by Mr. Pollard, builder, at 18,000*l.* The arrangements for the ceremony were not very satisfactory.

London Thoroughfares.—On reading a late number of your publication, I see that you have been meditating, not among the tombs, but where they used to be. Now, sir, permit me to tell you what we want in that locality, and I hope you will give us your assistance, and that is, a new street from the Eastern Counties Station to Victoria-street, if not along to New Oxford-street. However, I should be glad to see it from the station to Aldersgate-street for the present: it would open up that awful nest of filth in Redcross-street, Whitecross-street, and Golden-lane. I would bring it straight through Castle-street, past the end of the new buildings about to be erected in the City-road, the end of which buildings might have a good front towards the new street. Then I would advise that all the houses in the new street should be for the working classes, with three and four rooms on each floor, like those in Glasgow (not great red and black buildings like a workhouse, but every house to have a shop with complete little houses on each floor): they would pay well, and be very comfortable for the tenants. I believe if the parish would take this scheme up, with the sanction of the Board of Works, it would be the greatest blessing possible for that neighbourhood, besides adding very much property to the parish. If you will look at it, you will see there is nothing stands in the way but a few grave-stones at the back of the Artillery-house; and as they are removing out of one yard, I suppose there would not be much difficulty about the other. But, independent of that, we want a street from the City-road to the station. It is the greatest difficulty to get to it now—only through narrow crooked lanes, so that two cabs can scarcely pass; and I have often wondered that the railway company never made a move in that direction, it is so much wanted, and would do so much good. I hope you will look on this scheme with your wonted favour on behalf of the working man.—J. Walker.

[Advertisement.]

Messrs. Clark and Co.

15, Gate-street, Lincoln's-inn-fields.

Gentlemen,—After eight years' trial of your Patent Revolving Shutters, erected here, I can safely pronounce them most effectual in their action, and they have given me the utmost satisfaction,

I am, Gentlemen, yours, truly,

Geo. Downe.

155, Leadenhall-street, August 7th, 1856.

NOTICE.—All communications respecting *advertisements* should be addressed to the "Publisher," and not to the "Editor:" all other communications should be addressed to the Editor, and not to the Publisher.

ADVERTISEMENTS.

TO LEAD GLAZIERS OF STAINED GLASS

COMPETENT Persons may obtain EMPLOY, and liberal wages, by applicati n to Mr. WARRINGTON, Stained-Glass Works, 42, Berkeley-street West, London. Country hands will be preferred

N.B. None belonging to the "Glaziers' Combination Club, or Society," will be employed.

WANTED, by a Builder, a practical, working Man, to act as CLERK and FOREMAN. None need apply who se character will not bear the strictest investigation. Apply, immediately, at St. Paul's lodge, St. Paul's road, Camden New Town

WANTED, a thoroughly competent Person, accustomed to MOULDING by MACHINERY. He must be strictly sober, and able to produce satisfactory references, State terms and where last engaged Apply to C. BAKER and CO City Saw-mills, Canon's-marsh, Bristol.

WANTED, in an Architect and Surveyor's Office, in the country, a competent ASSISTANT.—Application, stating terms, referen c, and qualification, to be made to Mr. KNIGHT, 84, George's-place, Cheltenham.

TO BUILDERS' FOREMEN.

WANTED immediately, a thoroughly practical and experienced general FOREMAN Apply by letter only, prepaid, to H. G. M. 3, Melbourne-terrace, Prattstreet, Camden town

WANTED, a CLERK of WORKS, for about three months, to superintend the construction of a Brick Main Outfall Sewer, under the direction of the Engineer; a party accustomed to the work would be preferred.—Applications, stating salary required, and enclosing testimonials, to be addressed to the Chairman of the Luton Local Board of Health, on or before the 18th instant, indorsed "Clerk of Works." Luton, August 6th, 1856.

WANTED, immediately, a FOREMAN of BRICKLAYERS State age, wages, and references—Address, A. Gardner's Library, Guildford.

WANTED, by the Advertiser, a SITUATION as an ASSISTANT to a BUILDER or ARCHITECT, at a moderate salary; he is a good draughtsman, perfectly acquainted with the duties of an office, can superintend work, and prepare working drawings.—Address, X. O. Office of "The Builder."

TO LAND SURVEYORS, ENGINEERS, &c.

WANTED, by a respectable Young Man, aged 19 a SITUATION as ASSISTANT. He has a knowledge of surveying, levelling, mapping, and plan drawing. Salary not so much an object as improvement and a permanent situation No objection to the country.—Address, M. C. L. 7, St. George's-road, Portland road, Notting hill.

WANTED, an ENGAGEMENT as CLERK or otherwise, by a clever, active, and gentlemanly man, in his 23th year. Has a thorough practical knowledge of business generally, accounts, book-keeping, and correct ondence. References from one of the first houses in London.—J. G. 15, King William-street, City.

TO DECORATORS AND BUILDERS.

WANTED, by a good Tradesman, a SITUATION as PAINTER, GLAZIER, and PAPERHANGER. Can fill up best of Plumbing Address, A. B. 24, Tennison-street, Broad-street, Lambeth Good references

TO PLUMBERS AND BUILDERS

WANTED a SITUATION, as PLUMBER, by a young Man, who has a good knowledge of the trade, and will turn his hand, if required. Town or country. Address, C. B. 28, Thomas-street, Gibson-street, Lambeth.

WANTED, by a Young Man, who has been in business for himself in the country, a SITUATION as BOOKKEEPER, CLERK, &c He is quick at measurements, and can produce good testimonials from parties in the first station. As he is desirous of immediate employment in an office in London, salary at first would not be so much an object.—Address, W. C. 7, Richmond-street, St. George's-road, Southwark.

TO BUILDERS, &c.

WANTED, by a thorough practical Man, a SITUATION, as OUT-DOOR FOREMAN. Would not object to take charge of country. Best of testimonials.—Address, A. B. No 20, Peter-street, Hoxton road

TO PLUMBERS, BUILDERS, AND OTHERS

WANTED, by a first-rate PLUMBER, a constant SITUATION. No objection to town or country. Good reference if required.—Address, J. C. L. No. 25, Mill street, Mansion-street

WANTED, by a Young Man (a good workman), recently from the country, a SITUATION as BENCHMAN in a good joiner's shop Address, stating terms, A. B. 21, John-street, Pentonville, London. Town made can be had if any extent

TO PLUMBERS, PAINTERS, GLAZIERS &c

WANTED, by a Young Man from the country, a permanent SITUATION, where he could receive general improvement in the above branches Would be glad to fill up his time in the office.—Address, W. A. O. 68, Dean-street, Soho.

TO ARCHITECTS, ENGINEERS, AND OTHERS.

WANTED, an ENGAGEMENT with an ARCHITECT or others. The advertiser is a fair draughtsman, and is anxious to obtain a situation in an office transacting large business Salary not an object.—Address X. Y. Z. 16, New-road, Hammersmith.

TO ARCHITECTS, ENGINEERS, AND OTHERS.

WANTED, an ENGAGEMENT with an ARCHITECT or others by a DRAUGHTSMAN and GENERAL ASSISTANT. The advertiser is a first-rate draughtsman and colourist, and familiar with office practice. References given.—Address, X. Y Z. Post-office, Starch-green, near London.

TO BUILDERS, SMITHS, GASFITTERS, BELLHANGERS, AND OTHERS.

WANTED, by the Advertiser, an experienced man, a PERMANENT SITUATION in any of the above branches; has a thorough knowledge of all kinds of hot water apparatus Address, T. TAYLOR, 3, Albert-place, Hornsey-road, Holloway, Islington.

TO PLUMBERS, BUILDERS, GASFITTERS, AND OTHERS.

WANTED, by an experienced Young Man, a SITUATION as PLUMBER, GASFITTER, or PAINTER and GLAZIER. A permanent situation particularly required. No objection to the country —Address, T. JONES, 8, Albert-place, Hornsey-road, Holloway.

TO PLUMBERS AND BUILDERS.

WANTED, by a Young Man, a Permanent SITUATION as PLUMBER and GASFITTER; can undertake the painting and glazing, if required. - Address to W. R. No. 6, Gloucester-street, Blackfriars-road.

WANTED, by a Practical Man, a SITUATION as CLERK of WORKS, or GENERAL FOREMAN. Is well acquainted with the various building trades, and is a good draughtsman. Unexceptional testimonials. No objection to the country.—Address, A. B. No. 4, Carthusian-street, Charterhouse-square, City.

TO BUILDERS AND OTHERS.

THE Advertiser is desirous of taking BRICKWORK at per Rod, including labour and scaffolding, or labour only.—Address, M. B. 1, Cumberland-place, Hammersmith gate

TO STONEMASONS

THE friends of a respectable Youth, aged 17, wish to APPRENTICE him to the trade (for perfection), for two years A moderate premium will be given.—Address, Mr. BUSH, Architect, 15, Clifford street, Bond street

TO ENGINEERS OR ENGINEERING CONTRACTORS

THE Advertiser, who has had seventeen years' experience on general works, wishes to meet with an ENGAGEMENT. Is a good draughtsman, and well acquainted with measuring works, taking out quantities, levelling, &c &c. First-rate testimonials No objection to go abroad.—Address, A. G. W. Office of "The Builder."

TO BRASSFOUNDERS, HYDRAULIC ENGINEERS, BEER-ENGINE MAKERS, AND OTHERS.—WANTED, a SITUATION as CLERK, COLLECTOR, TRAVELLER, or combined. Has been used to the management of an establishment as above; has a practical knowledge of the same, and can make plain drawings for patenting &c. Unexceptionable references and security.—Address, F. M. Post-office, Watling-street, City.

TO ARCHITECTS.

THE Advertiser, who is a neat and expeditious DRAUGHTSMAN, and has had five years' experience in preparing Gothic, general, and working drawings, is desirous of meeting with a PERMANENT ENGAGEMENT in London.—Address, D. E. F. 9, High-street, Camden-town.

TO LAND AGENTS, SURVEYORS, AND OTHERS.

THE Advertiser, a neat DRAUGHTSMAN, is desirous of obtaining an ENGAGEMENT as an ASSISTANT in a Land Agent and Surveyor's Office.—Address, A. A. 961, Oxford-street, London.

THE Advertiser, a Young Man, is desirous of a SITUATION as FOREMAN to a small Builder or Carpenter. He understands is keeping accounts, can prepare all kinds of drawings, and measure up work No objection to work at the bench or at buildings.—Address, R. P. Office of "The Builder."

TO ARCHITECTS AND SURVEYORS

THE Advertiser, who has completed his Articles in the office of an Architect and Engineering Surveyor in the country, is desirous of an ENGAGEMENT.—Address, A. B 7, Southwood-lane, Highgate.

TO ARCHITECTS, &c.

THE Advertiser, a good DRAUGHTSMAN and DESIGNER in ECCLESIASTICAL and GOTHIC ARCHITECTURE together with Italian, &c and who is well accustomed to the preparation of working drawings and details, perspectives, and a good hand at it, is open to an ENGAGEMENT in town No objection to a clerkship of the works. Address, N.A. Post-office, Osnaburgh-street, Regent's park.

TO LITHOGRAPHERS, WOOD ENGRAVERS, AND OTHERS

THE Uncle of an Orphan Boy, aged 15, is desirous of APPRENTICING him to either of the above business As the advertiser's means are limited, the premium must be small.—Addre s, post-paid, W. W. Post-office, Millbank-street.

TO ARCHITECTS.

A PRACTICAL CLERK of WORKS wishes a RE-ENGAGEMENT.—Address, J. C. Office of "The Builder."

TERRA-COTTA POTS, &c.

Erected in London upwards of 20 years since, are now as sharp and perfect as when first manufactured

Drawings on application to

H. DOULTON & CO. High-street, Lambeth.

ANNUAL DIVISION OF PROFITS.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY,

14, Waterloo-place, London, and 30, Brown-street, Manchester.

DIRECTORS.

THE CHISHOLM, Chairman.

RICHARD HARTLEY KENNEDY, Esq. Alderman, Deputy-Chairman.

This Society is established on the tried and approved principle of Mutual Assurance. The funds are accumulated for the exclusive benefit of the Policy-holders, under their own immediate superintendence and control. The profits were divided annually, and applied in reduction of the current premiums. Policy-holders participate in profits after payment of five annual premiums.

The Annual General Meeting was held on the 28th May, 1856, when a highly satisfactory Report of the state of the affairs and progress of the Institution was presented to the Members. During the last three years, upwards of 1,200 new assurances have been effected, yielding an increase of premium income of more than 20,000l. per annum; and although a general high rate of mortality has prevailed among Assured in Britain for the last two years, it has not been deemed necessary to reduce, in the slightest degree, the allowances previously awarded to the Policy-holders.

The Members present at the meeting were fully satisfied with the Report, and resolved unanimously that a reduction of 3½ per Cent. should be made in the current year's Premium payable by all Policy holders now entitled to participate in the Profits.

Credit is allowed for half the annual Premiums for the first five years.

A. R. IRVINE, Managing Director.

14, Waterloo-place, London.

2nd June, 1856

ORGAN TO BE SOLD, at a SACRIFICE, as it must be moved before the 29th instant. To be seen at Mr. G. SMITH'S, 8 Park row, Greenwich. It was built within the last five years, by Berrington and sons, builders of the price organ, Crystal Palace, Paris Exhibition. It contains 9 stops, viz. open and stopped diapason, and stopped diapason bass, dulciana, flute, principal, fifteenth, hautboy, and sesquialtra; foot and hand blower, 3 composition pedals and swell, and 2½ octaves of German pedals. It is built of mahogany, has a handsome front of gilt pipes, and is an exceedingly sweet harmonious instrument; height 8 feet 8 inches, width 6 feet 10 inches, and depth 3 feet 7 inches Price 100l.

TO BE DISPOSED OF, a quantity of ORNAMENTAL FLOORING, from the Austrian department of the Exhibition of 1851.—Apply to Messrs. PATMAN and FOTHERINGHAM, 68, Theobald's-road, Bloomsbury

ONE HUNDRED capital OAK TIMBER TREES, some containing upwards of 100 cubical feet, all of great lengths, straight, clean, and of excellent quality, to be DISPOSED OF by private contract, at ALFRED JOHNSON'S Timber Yards, near the Railway Station, Cambridge.

FLOOR BOARDS, &c.—R. SLADE begs to inform Builders and the Trade, that he has now on hand a large assortment of FLOORING and MATCHED BOARDING, from 4 inch to 1½ inches thick, seasoned, and ready for use; also, Mahogany, Moulding, Wainscot, and all kinds of Timber required for Building purposes. — Address, R. SLADE (late E. Simms), Flooring Manufactory, Wilton-road, Pimlico.

AT the LOWEST PRICES.—SAMUEL PUTNEY invites the attention of buyers to his large and well-selected Stock of the various descriptions of Deals, commencing at the following low prices:—

Yellow Deals, from	£20	0	per 120
Spruce ditto, from	18	0	"

Timber, deals, planks, &c. at the lowest remunerative prices. A liberal discount allowed on mouldings for exportation. Book of designs forwarded on application

STAINING DEAL TO IMITATE ALL KINDS of WOODS. It requires NOSIZING, and will stand the exposure to the weather. Price 2s. per gallon. Varnish for W. NAILDRIS Stains may be had at the Factory, 44, James-street, Oxford-street; also Manufacturer of Improved Knotting and Decorative Varnishes.

TO BUILDERS, PAINTERS, &c.—OAK GRAINING in OIL 4d. per yard, in quantities not less than 60 yards. Church writing done in the Elizabethan style. No objection to the country, if expenses are paid. References given.—Apply to CHARLES PETTET, 5, Princess-street, Edgware-road.

GRAINING by MACHINERY.—The present system of graining is far surpassed by the use of BELLAMY'S PATENT GRAINING MACHINES, by which an ordinary workman can produce first-class work, and at an immense saving of time. The designs are perfect imitations of the choicest specimens of fancy woods and patterns of the first artists.

The Patent Graining Company are now prepared with a large and well assorted stock of instruments, which they offer to grainers, painters, builders, and others without inequality.

Grained paper in imitation of all kinds of fancy woods of the choicest descriptions, in the piece, or in sets for panels, &c. wholesale and for exportation. Pattern-boards and cards for the trade in great variety.

Painters, grainers, decorators, merchants, and others are respectfully invited to inspect the patterns, and see the process at the Company's Offices, 34, Minories, and Bull's-pound, Islington, London.

TO FRENCH POLISHERS, CABINET-MAKERS, BRASS-WORKERS, &c. — A considerable reduction has taken place in the prices of French polish, white and brown hard spirit varnishes, spirit lackers, and finishing spirit. The present price is 6s. to 6s. 6d. per gallon; white French polish, 12s. per gallon; white shellac, 1s. 8d. per lb.; gums, shellacs, and acid at the lowest prices. A net cash list forwarded on application to JAMES SLIPPER, 87, Leather-lane; and 14 and 15, Dorrington-street, Holborn, London.

TO PAINTERS, BUILDERS, &c.—LIVETT, FRANK, and SON, No. 14, Borough, London-bridge, opposite the Brighton and South-Eastern Railway Stations, quote their present prices for cash:—Linseed oil, 3s. 3d.; boiled, 3s. 6d.; turpentine, 2s. 8d.; oak varnish, 7s. 6d. per gallon; genuine white lead, 33s.; seconds, ditto, 31s.; best town glue, 43s. per cwt.; colours, brushes, &c. equally low. Lists of prices on application.

KENT'S PAINTING-BRUSHES are of the very best quality, and may be obtained at all the first houses in the trade, and of the manufacturers, G. B. KENT and CO. 11, Great Marlborough-street, London. Established 1777.
N.B. Kent's Painting Brushes are all stamped G. B. KENT & CO.
Price Lists forwarded by post.

BEST PAINTING-BRUSHES.—J. B. TYLOR, Painting-brush Manufacturer, 2, Bury-court St. Mary-Axe, London, invites the attention of Painters and Builders to his Brushes and Tools both Metallic, Jetting, and, which, being manufactured on his own premises, and of bristles of the best quality, he can recommend as a superior article. Price lists forwarded on application, post-free.

N.B. All communications and orders punctually attended to, and addressed to the Manufactory, JAMES LYNE HANCOCK, Goswell-mews, Goswell-road, London.

DURABILITY of GUTTA PERCHA TUBING.—Many inquiries having been made as to the Durability of Gutta Percha Tubing, the Gutta Percha Company have pleasure in submitting to the full examination of their Customers the following letter from SIR RAYMOND JARVIS, Bart., PLANTATION, ISLE of WIGHT.—Second Testimonial.—"March 10th, 1852.—In reply to your letter, received this morning, respecting the Gutta Percha Tubing for Pump Service, I can state, with much satisfaction, it answers perfectly. Many Builders, and other persons, have lately examined it, and there is not the least apparent difference since the first laying down, now several years, and I am informed that it is to be adopted generally in the houses that are being erected here."

N.B. From this Testimonial it will be seen that the CORROSIVE WATER of the ISLE of WIGHT has no effect on Gutta Percha Tubing.

THE GUTTA PERCHA COMPANY, PATENTEES,
18, WHARF-ROAD, CITY ROAD, LONDON.

HOSE PIPING.—WAITHMAN'S PATENT FLAX HOSE PIPING will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe. Manufactured only by WAITHMAN & CO. Bentham, Lancaster.

No. 1 quality, inches diameter, and price per yard.

½	¾	1	1¼	1½	2	2½	3 in
9d.	11d.	1s.	1s. 3d.	1s. 7d.	1s. 11d.	2s. 4d.	2s. 9d.

Paints, Stucco, &c. Marble Merchants and Importers of Pozzolano.

ELMLEY CEMENT WORKS.—ROMAN and PORTLAND CEMENT of the first quality, manufactured on the above works. Also STOCK and KILN-BURNT BRICKS, hand moulded and machine made, for shipment or otherwise.—Apply to G. BOOTH, Agent, as above.
11 George-yard, Lombard-street, City.

KEENE'S and PARIAN CEMENTS and FRENCH PLASTER, for internal uses. These well-known hard Stuccoes dry quickly, and can be painted upon within a few days. Made and sold by JOHN BAZLEY WHITE and BROTHERS, Millbank-street, Westminster.

ATKINSON'S CEMENT, so long known and esteemed in London for plastering purposes as a quick-setting Cement, that requires no coloring.—Sold wholesale only by JOHN BAZLEY WHITE and BROTHERS, Millbank street, Westminster; and Seel street, Liverpool.

ARTIFICIAL HYDRAULIC or PORTLAND CEMENT combines the valuable qualities of the natural Cements with the additional advantage that it can safely seeds them in its cementitious properties, that it is not affected by frost, and does not vegetate in damp situations. Account of COMPARATIVE EXPERIMENTS on the strength of this and other Cements used at the Institute of Civil Engineers, to be obtained from the Makers, JOHN BAZLEY WHITE, and BROTHERS, Millbank-street, Westminster, who prepare one quality only of Portland Cement.

BATH, PORTLAND, and ROMAN CEMENTS.—The London and West of England Cement Company can offer to the Trade the best natural HYDRAULIC CEMENTS at reduced prices. The Company particularly recommend the best quality of their Bath Cement for all mouldings, cornices, decorations, &c as having all the qualities requisite for an interior cement, and being quite unaffected by extremes of weather. The Company also supply BLUE LIAS LIME, lump and ground, which will carry more sand than any in the market.—Communications to be addressed to the General Offices, 80, Old Broad-street, London; to Mr. MONUMENT, 4, Caroline-place, City-road; to Mr. TIMEWELL, the Depôt, 6, North Wharf-road, Paddington; or to the Works, Dunball, Bridgewater.

SOUTHAM BLUE LIAS LIME DEPOT.
Glazed Stoneware Sewage Pipes.
Brick, Lime, and Cement Merchants,
TATHAM and CO.
14, South Wharf, Paddington.

PARIAN CEMENT, reduced in price 25 per cent. This article is valuable for inside stuccoing and especially for skirtings, for flooring on brick arches, &c. It takes paint in a few hours after its application on walls or laths, is without efflorescence, and may be painted in a week or days. A finer quality forms a beautiful Scagliola, with any admixture of colours.—Manufactured by FRANCIS, BROTHERS, Cement Works, Nine-elms, London.

CEMENT.—ROMAN and PORTLAND CEMENTS, and PLASTER of PARIS, manufactured by C. J. HILTON, can be had in any quantity, wholesale or retail, at his wharf, 6, Upper Thames street, London, in front of the manufactory, Faversham, Kent.—N.B. These Cements supplied for shipment, on advantageous terms.

JOHNS and CO.'s PATENT PERMANENT STUCCO WASH (perfectly non-absorbent), STUCCO, CEMENT, STUCCO PAINT, CLARK and BEVOCOCH, Manufacturers, Grand Surrey Canal Bridge, Old Kent-road. Office, 4, George yard, Lombard-street.

16, South Wharf, Paddington, June 1st, 1856.
NOTICE.
GENUINE BLUE LIAS LIME.—J. D. BLYTH (late senior partner of the firm of Blyth Brothers, Plaster Works, Robinson-place, Gray's Inn-lane, begs to inform his friends and the trade that he has made arrangements with Mr. CHARLES NELSON, of Warwick, for the entire MANAGEMENT of his BUSINESS in London, in reference to the Sale of his Lump and Ground Blue Lias Lime, Parian and Lias Cements. J. D. B. trusts, that by prompt personal attention to all orders he may be favoured with, to merit a continuance of the patronage hitherto so liberally received by the late firm. Contracts to any amount can be undertaken, and a regular supply guaranteed.—Prices and terms forwarded to all parts of England and the metropolis.

HUBBUCK'S WHITE BODY PAINT of superior body to the Best White Lead, whilst it is as smooth and permanent as Zinc Paint. One coat laid on as directed is equal to two coats of White Lead, whilst the consumption of material is less than for one coat. It dries very fast and hard.
HUBBUCK'S STONE COLOUR BODY PAINT the same as the former, at three-fourths the price.
HUBBUCK'S PATENT WHITE ZINC PAINT is invaluable for Iron Ships and iron exposed to salt water; neither bilge water, nor noxious vapours from cargo, nor heat on funnels of Steam Vessels act upon it. Sold by the Wholesale Paint Dealers, in original packages, stamped, HUBBUCK, LONDON, PATENT; and when so marked the quality is guaranteed.
HUBBUCK'S COPPER COLOUR ENAMEL PAINT prepared expressly for the bottoms of Iron and Wood Steam Ships, a protection from rust and incrustation. Timber coated with this Enamel is not attacked by the worm, neither do barnacles attach to it.
Full particulars of THOMAS HUBBUCK and SON, Paint and Varnish Works, opposite the London Docks, London.
OLD ZINC AND ZINC CUTTINGS BOUGHT TO ANY EXTENT.

GREY STONE LIME WHARFS, 12, UPPER GROUND-STREET, Blackfriars (Surrey side).
7, NORTH WHARF-ROAD, Paddington.
WILLIAM PETERS begs to inform the trade he is in a position to supply the best GREY STONE LIME in any quantities from the above wharfs, or per barge direct from the kilns.
Large Grey Stone, or Grey Chalk, free on board at Works, 8d. per ton.
Small ditto, ditto, 4d. per ton.
Barges loaded in a few minutes.
Wouldham-hall Grey Stone Lime Works, on the Medway, near Rochester.

NOTICE.
SOUTHAM HYDRAULIC BLUE LIAS LIME.
WILLIAM OLDHAM begs to inform those parties requiring genuine Hydraulic Blue Lias Lime, that he is prepared to deliver the best quality of ground and lump into boats, at the Works—Address, WILLIAM OLDHAM, Blue Lias Lime and Cement Works, Southam.

BLUE LIAS LIME.—Messrs. GREAVES and KIRKSHAW having completed their Works on the Birmingham and Oxford Line of the Great Western Railway, at Hearn, are now prepared to supply LUMP and GROUND LIME of the best quality, direct from the kilns, to all the stations on the Great Western Railway—Greaves's Blue Lias Lime Depôt-lands, Bath, and Lias Cement Works, at Harbury, Stockton, and Wilmcote Office, at Warwick.

GREY and CHALK LIME.—W. T. ALLUM and CO. late of the firm of Thos. Preen and Co.), Grey and Chalk Lime Burners, on the Medway. Agents for the Wouldham Patent Portland Cement, and Dealers in Roman Cement, Plaster of Paris, &c. &c.—27, Wharf-road, City-road.

CHARLES RICHARDSON, 3 & 8, SOUTH-WHARF, PADDINGTON BASIN.
COWLEY AND KENT BRICKS,
PORTLAND, ROMAN, AND OTHER CEMENTS,
TAMWORTH GLAZED SEWAGE PIPES
BLUE VITRIFIED BRICKS, COPINGS, PIPES, &c.

3 & 8 South Wharf, Paddington.
NOTICE.
CHARLES RICHARDSON takes the earliest opportunity of informing Engineers, Architects, Contractors, and others, that he is now bringing GREAVES'S BLUE LIAS LIME per the Great Western Railway from Harbury to Bull's-bridge and Paddington, from whence it can be delivered alongside any part of the river Thames, canals, or railway stations in London the day after it is burnt and ground, in any quantity, and at a great reduction in price.
All applications for prices and terms will meet with prompt attention.
N.B. Please observe the lime is ground at the works, not in London.

PLASTER of PARIS manufactured by T. P. BLYTH, Baldwin's-place, Gray's-inn-lane, Holborn. The trade and shippers supplied on advantageous terms. Roman and Keene's Cement, Tiles, Plasterers' Hair, Pan and Plain Tiles, Fire Goods, &c

CHEAP WHITE BRICKS, for FACING HOUSES (Beard's Patent).—These bricks are of excellent make and colour, and impervious to frost, and will not vegetate or become green.—For particulars, address, Patent Brick Works, Rugby, Warwickshire.

THE BEST HERTFORDSHIRE MALM SECONDS;
THE BEST WHITE SUFFOLK and RED FACINGS;
WHITE SUFFOLK PERFORATED BRICKS;
DEEP RED DUBBING BRICKS.
Also COWLEY and KENTSTOCKS, in any quantities
J. EASTWOOD and SONS, Belvidere-road, Lambeth; and Surrey-canal-bridge, Old Kent-road, Surrey.

BRICK-FIELDS, QUEEN'S-ROAD, PECKHAM, SURREY
(Within a short distance of the fire bridges).
THE BEST MALM-CUTTERS, SECONDS, PICKINGS, and PAVIORS, in any quantity.
Also, STOCKS, of FIRST QUALITY.
J. EASTWOOD and SONS, Belvidere-road, Lambeth.

BRICKS of all kinds (clamp-burnt or kiln-burnt), Lime, Chalk, Chalk Rubbish for brick-making, Flints for building and pottery work, Foundry Loam, Whiting, Whitine Sand for asphalte, Land Drain Pipes, Patent Drain Pipes, Gas Soil for brick-making, &c. &c. sent by barge from Messrs. MEESON and CO.'S works at Grays, Essex, to any part of the Thames, the various canals, the river Lea, &c. or by rail to any station on the London and Southend and Eastern Counties lines, or any railway connected with them. Vessels of 300 to 500 tons can load alongside the wharves at Grays. At MEESON and CO.'S wharf and kilns, Bow-bridge, Stratford, Essex, the above-named articles can also be procured, as well as all kinds of fire goods, both Welsh and Newcastle. Fire-clay, Flare-burnt Lime, and Marble and Temper Lime; and here lime is packed in hogsheads, casks, jars, &c for exportation.
General Office—No. 13, GEORGE-YARD, LOMBARD-STREET.
Letters addressed to Grays Essex, will meet with immediate attention.

BRICKS.—Malm Cutters, Yellow and Pale Seconds, Paviors, and Pickings, of good and sound quality, constantly on sale at H. DODD'S Brickfields, which are only a quarter of an hour's walk from the City. H. D. earnestly requests purchasers to favour him with a visit, in order to inspect his stock and to judge for themselves.
Malm Place Half-washed Stocks, and Place Bricks, also on sale. These bricks are sound, well burnt, and unusually free from defects; a very large proportion of the stock being suitable for external facing.
Apply to HENRY DODD and CO. at the Counting-house, Hoxton Brickfields, Grange-walk, near the Rosemary Branch, Hoxton.
N.B. Light-coloured Pit Sand of approved quality constantly on sale upon reasonable terms. This Sand, from its not containing any saline matter, is acknowledged to be preferable to river sand.

BLUE BRICKS and TILES, of superior quality, and in great variety of mould, for ornamental work, paving, coping, and general purposes.—GEO. C. KYLAND, Hailstone Wharf, Crescent, Birmingham.

EXCELLENT STOCK BRICKS for SALE. Apply to Mr. MARSH'S Agent, at the Field, Wells-road, Sydenham; or at Mr. MARSH'S Offices, 2, Charlotte-row, Mansion-House.

FIRE-BRICKS, LUMPS, TILES, &c.—FURNACE-BUILDERS, GAS COMPANIES, and CONSUMERS of these Goods generally, can be SUPPLIED with every description from our Wharf here, on the most advantageous terms.—TRAQUAIR and CO. 9, Bankside, Southwark.

BRICKS.—Mr. Rydon having made more bricks than he requires for the builders on his estate, Highbury New-park, would be willing to enter into arrangements with builders and others for supplying first-class STOCK and RED BRICKS upon advantageous terms. For particulars, apply at the Estate Office, Dell's Farm, Stoke Newington Green.

REMOVED FROM CRITCHILL-PLACE, NEW NORTH-ROAD, HOXTON.
BRICK MOULDS (improved), Steel-face Stocks, and Plates, with Screw Stock Pegs, used four seasons. Various sizes kept on hand. References where in use. Hay & Mill Work and Implements. J. LEACH, Millwright and Engineer, 9, St. Peter's-square, Hackney road, London

TO POTTERS, BRICKMAKERS, and OTHERS.—TO BE LET, ELEVEN ACRES of LAND, containing an inexhaustible supply of pipe-clay, better than fire-clay, and pure sand, situate near several commercial towns, in the county of Hants. The whole of the erections and plant can be rented at a moderate sum. Coming in for stock very trifling.—Specimens can be seen, and further particulars had, by application to Mr. S. BROAD, Auctioneer and Valuer, Above Bar, Southampton.

ROUPELL-PARK BRICKFIELDS LOWER NORWOOD, SURREY. Entrance, Norwood end, Palace-road.—BRICKS of the first class. Red Kiln Bricks Cutters, Pressers, Facings, and Paviors, Clamp-burnt ditto, Yellow and Pale, Seconds, Parrot, and Pickings, Washed Stocks, Stocks, and Place.—Apply to THUMAN and CO. Norwood Lodge, Palace-road, Roupell park, Lower Norwood, Surrey.

THE PATENT BRICK MACHINE COMPANY invite orders for their IMPROVED MACHINES. One of them is working in a field at Caterham, near Croydon, and arrangements are made with the owner for hearers of a letter from the Secretary, to see it in operation every Thursday and Friday. It is the most simple machine invented. Trains from London-bridge to Warlingham (close to the field), leave at 6 and 9.30 a.m. and 4 p.m.; return at 9.55 a.m. and 5.5 and 7.55 p.m.
HENRY C. MOUNT, Sec.
37, King William-street, City.

BEADON'S EAVES GUTTER TILES.—Mr. LAWES is prepared to CONTRACT for the ERECTION of the above TILES on roofs of all descriptions, in the neighbourhood of London, at 7d. per foot; above 100 feet, 6d.—Office, 1, Adelaide place, London-bridge.

BEADON'S PATENT IMPERISHABLE GUTTER-TILES.
For Spouting Roofs of all sizes (either old or new, whether of thatch, slate, or tile), and other structures.
SOLE AGENT,
J. B. LAWES, 1, Adelaide-place, London-bridge.
This is the cheapest kind of spouting known; for, besides its lower cost, it will last without paint or repair as long as the building itself. It will bear the weight of any ladder, and in case of accident a labourer can repair it. It occupies the room of a large amount of roofing, effecting a great saving in slates, tiles, &c. Is especially applicable to the backs of houses in town, cottages, and agricultural buildings.
Price 4d. each tile of about 23 inches long; stop-ends and outlets, 6d. Any mason can put them up, or, if over 100 feet are required, a man will be sent to fix them at 5d. per foot. This charge to include tiles delivered in Aycroft's yard, cement, and labour. May be had in London, Gloster, Bridgwater, and Ruabby.

PEAKE'S TERRO-METALLIC TILES, PIPES, &c.—Notice is hereby most respectfully given, that the LONDON DEPOT for this WARE is REMOVED to No. 21, WHARF, Macclesfield-street North, City-road Basin. Secondly, that the trade term, "TERRO-METALLIC," is the exclusive right of the Proprietor; and, thirdly, that the "Reports of the Jurors," page 501, of the Great Exhibition, rank the Manufactories known so long as "The Titeries," Tunstall, Stafford-shire, as the first of the kind in the world.

PANTILES, PAVINGS, &c.—J. H. ANDREWS, Wisbech, Cambridgeshire, begs to offer pantiles at 52s. 6d. per 1,000; floor bricks and 6-inch pavings, at 37s. 6d. per 1,000; 9-inch pavings, at 57s. 6d. per 1,000; plain tiles, at 75s. per 1,000, delivered. Cash prices.—Delivered on trucks in London on Eastern Counties Railway.

H. and R. HAYWOOD, Brownhills Blue Metallic Tileries, near Burslem, Staffordshire; London Depôt, 15, South Wharf, Paddington, Manufacturers of Improved Plain and Ornamental Roofing, Ridge, and Flooring Tiles, for Churches, &c.; also Metallic Plain and Socket Sewerage Pipes, &c. adapted for Sanitary and Railway purposes. They are extensively used on the London and North Western, Great Western, Trent Valley, North Staffordshire, and other Lines of Rail, and highly approved. Warranted imperishable, and to resist all acids and exhalations.
*** A FIRST-CLASS MEDAL was awarded to H. and R. HAYWOOD, by the Jury of the GREAT EXHIBITION.

WILLIAM GILBERT, Manufacturer of all kinds and colours of Tiles, Quarries, Drain-pipes, Moulded Bricks, Brackets, Vases, Chimney-pots, Stoneware Glazed Sewerage Pipes, Ornamental Garden Books, &c.
Tividale, Staffordshire.

PAINT, certified by the Government Engineers and Contractors to be the CHEAPEST and BEST over discovered for wood and iron, price 45s. per cwt.—Apply to the London Anti-Oxyde Paint Company, D. WALKER, Secretary, 29, New Bridge-street, Blackfriars.

WOLSTON'S TORBAY IRON-PAINTS, warranted to stand the action of the Atmosphere, Steam, Gases, Noxious Vapours, Damps, and Salt Water, also intense heat without blistering. These Paints have been tested for five years in Her Majesty's Dockyards, and two Official Reports made thereon, which testify that Cells of Wolston's Torbay Iron-Paint will effectually cover as much surface as 112lbs. of either White or Red Lead, and that they resist atmospheric action better than Lead Paints. For all Public Works, Galvanized and other Iron Roofing, Fencing, Shipping purposes (Wood or Iron), Stucco and Cement Fronts, economy and durability will be secured. To Builders and Painters, for all priming purposes, the saving will be immense. Manufactured at the TORBAY IRON PAINT and OIL WORKS, Brixham, Devon; London Depôt, Chamberlain's Wharf, Letters or orders addressed to Mr. WOLSTON, at the Works, or No. 34, John-street, Bedford-row, will have immediate attention.

TO ARCHITECTS, BUILDERS, CONTRACTORS, AND OTHER CONSUMERS OF GLASS.

HARTLEY'S PATENT ROUGH PLATE GLASS,

1-8th of an inch thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th or 4 lbs. is now universally used for

RIDGE AND FURROW ROOFS, GREENHOUSES, RAILWAY STATIONS, MILLS, MARKET HALLS, BATHS AND WASH-HOUSES, FACTORIES, WORKSHOPS, SHIP-BUILDING SHEDS, AND OTHER EXTENSIVE BUILDINGS.

By a carefully prepared Estimate, it has been ascertained that FOUR-FIFTHS of the ROUGH PLATE, or non-transparent Glass, consumed in the United Kingdom in 1854, was manufactured by HARTLEY'S PATENT—thus affording the most incontestable evidence of its superiority over every other article of the kind, and as being the only description of Glass suitable for the purposes above named. It combines size and strength with economy of cost, and is manufactured in sizes expressly for RIDGE and FURROW ROOFS, giving a SPAN of TWELVE FEET, at a price not exceeding, weight for weight, that of Common Crown Glass. Its non-transparency renders BLINDS UNNECESSARY, and no scorching occurs in Greenhouses glazed with it; hence the preference given to this Glass for all Horticultural purposes.

For further particulars, apply to

JAMES HARTLEY AND CO. SUNDERLAND; AND PURFLEET WHARF, EARL-STREET, BLACKFRIARS, LONDON.

Sole Manufacturers of Lockhead's Patent Perforated Glass for Ventilation.

*** *Hartley and Co.'s Glass Tariff Newspaper will be forwarded gratis, on application.*

January 1, 1855.

These pipes are made under steam pressure, and burnt to great hardness, and are capable of bearing nearly double the hydraulic pressure of ordinary glazed pipes. The prejudice against red-ware is overcome by this manufacture, and it is well known that good earthenware, UNGLAZED, is the oldest material discovered in a perfect state in Rome, Babylon, Nineveh, &c. &c.

TO LOCAL BOARDS OF HEALTH AND GAS AND WATER COMPANIES.

FREEMAN ROE'S PATENT SLUICE-VALVES, acknowledged to be the best in use; hydrants or fire-plugs; wells sunk and bored; the hydraulic ram; fountains; pumps of every description. Estimates prepared for all works connected with hydraulics or gas. Pumps let on hire.

W. F. ROE, late FREEMAN ROE, Hydraulic and Gas Engineer, 70, Strand, London.

STONE PIPES.—GLAZED STONEWARE PIPES of the most superior quality, at REDUCED PRICES.—E. and W. STURGE invite particular attention to their stock of these goods, which continue to give great satisfaction both as to manufacture and price. A list of which will be sent upon application. An increased discount will be allowed to large contractors. Every description of junctions, bends, &c. in stock. Yorkshire paving, sinks, sills, steps, and coping, &c.—E. and W. STURGE, Bridge-wharf, City-road.

PATENT SELF-ACTING WATER-CLOSETS, with ECONOMIC WATER-REGULATORS, manufactured on the newest principles, distributing with powerful flush over the surface of the basin, a smaller quantity of water than is usually needed, and effectually preventing waste. Admirably adapted for RAILWAY STATIONS, HOSPITALS, WORKHOUSES, and all public establishments. Also HIGH and LOW-PRESSURE powerful FLUSHING WATER-CLOSETS. Drawings, testimonials, and references of the highest respectability can be had on application. Specimens of each can be seen, fixed upon the Premises of the Patentee, W. PATTEN, 29, Old Fish-street, near St. Paul's, London.—Price for Closet and Apparatus complete, from 25s. and perfect action guaranteed.

SALES BY AUCTION.

The Royal Panopticon of Science and Art, Leicester-square, with the valuable Plant, Fixtures, and Two Dwelling-Houses adjoining, for Sale: important to Theatrical Managers and others.

CHINNOCK and GALSWORTHY have been favoured with instructions from the Mortgagees to SELL BY AUCTION, at the MART, on MONDAY, AUGUST 25, at TWELVE, that magnificent edifice the ROYAL PANOPTICON, Leicester-square, acknowledged to be, as an architectural monument, one of the chief ornaments of the metropolis. The structure is one of the most substantial character, vast in capacity, elegant in design, and profusely, and elaborately beyond description in decoration. The style of architecture is the Moorish of the fifteenth century, so rich in colour and pure in taste. It is impossible within the limits of an ordinary advertisement to do justice to the details of so extensive an establishment as this: a visit to the building alone can convey an idea of its grandeur and capabilities. The Panopticon was established by a public company, under a royal charter of incorporat on, as an institution for the promotion and development of science and art, and the exhibition of scientific objects and mechanical inventions, in connection with manufactures, and of works having for their object the extension of the fine arts: also as a music and lecture hall, and generally as a place for popular instructive entertainments. The structure is admirably adapted for these purposes, a sum of upwards of 80,000l having been expended upon the building and its permanent and valuable accessories. Among the many important properties connected with the edifice, coming under the denomination of plant, may be mentioned the grand organ, acknowledged to be one of the finest instruments in the world. It was constructed by Messrs. Hill and Co. and is one of the most powerful in existence, consisting of four manuals, each from CC to A in alto, and a pedal organ from CCC to F (thirty notes); being made for several as well as a single performer, it is capable of producing all the grand effects of the most celebrated continental organs. The wind is supplied by six bellows worked by steam power

There is also the crystal cistern, for subaqueous and diving experiments, the galvanic electrical machine, the largest ever constructed, having a plate 10 feet in diameter, and a conductor 6 feet in length, producing enormous effects; a 10-horse power steam-engine, with double boiler, and extensive hydraulic and gas apparatus and fittings; numerous instruments for the illustration of modern scientific discoveries, includ ng those connected with the microscope, the chronoscope, the kaleidoscope, dioramas, cosmoramas, &c. The Panopticon has tended much to promote public instruction in the department of science and art. Some alterations in the building and in the character of the exhibition, which have been suggested and approved of, would more effectually carry out the original design of this most useful institution, by which its resources would be greatly developed, and there is in addition to the main building, with its splendid galleries, there are two large lecture-theatres, machinery-rooms several workmen's offices, store-rooms, engineer's rooms, laboratories, and two dwelling-houses. —Detailed particulars, plans, and mode of sale, may be obtained at the Auction Mart, City; of Sir. BARR SLADEN, Esq. Solicitor, 14, Parliament-street, Westminster; Messrs. ALEXANDER, WILLIAMS, and JONES, Solicitors, St. Mildred's-court, Poultry; JOHN HARPER, Esq. Solicitor, 8, Barkham-terrace, Southwark; Messrs. VALLANCE and ALLARD, Solicitors, 20, Essex-street, Strand; and of Messrs. CHINNOCK and GALSWORTHY, Auctioneers and Surveyors, 28, Regent-street, Waterloo-place, London.

Seventh Sale of the Surplus Property of the North London Railway Company.

MESSRS. BEADEL and SONS have received instructions to SELL by AUCTION, at the MART, on TUESDAY, AUGUST 19th, at TWELVE, in 20 lots, numerous valuable Plots of FREEHOLD BUILDING LAND, forming the Churches d, in the parish of St. John, Hackney. Also 13 l ots of highly-desirable Building Land, fronting the St. Paul's road, and close to the railway station at Highbury. Some well-secured Ground Rents, and several desirable Shops, with residences, let to respectable tenants, at moderate rents, situate in Brecknock-place, Great Raid Ipl-street, Great Ormond-street, Prince-terrace, near the railway station, Camden-town.—Particulars may be obtained of Messrs. TEBBUTT, PAINE, and BAYTON, Solicitor, Guildhall-yard; at the Auction Mart; and of Messrs. BEADEL and Sons, 25, Gresham-street.

No 19, Marlborough-road, St. John's-wood.—First-class Leasehold Investment.

MESSRS. BEADEL and SONS have received instructions to SELL by AUCTION, at the MART, on TUESDAY, AUGUST 19th, at TWELVE, in one lot, a valuable VILLA RESIDENCE, known as Lexfield Villa, and being No. 19, Marlborough-road, St. John's-wood; held for a term of 76 years, from Michaelmas, 1845, at a Peppercorn rent, and at present let to a respectable tenant, at the rent of 85l. per annum. Particulars may be obtained at the Auction Mart; and of Messrs. BEADEL and Sons, 25, Gresham-street, London.

HIGHGATE-HILL, AT THE JUNCTION OF MAIDEN-LANE.—Very valuable Freehold Estate, comprising a capital old-fashioned Family Residence, with Stabling, Garden, and Paddock, the whole comprising about six acres, full of road and fine old earth, and, from its position, one of the most important and valuable building sites in the vicinity of London.

MESSRS. FAREBROTHER, CLARK, and LYE are instructed to prepare for SALE, at GARRAWAYS COFFEE HOUSE, on WEDNESDAY, the 27th of AUGUST, at TWELVE o'clock, in one lot, the very valuable FREEHOLD ESTATE, situate on Highgate Hill, at its junction with Maiden-lane, and close to the town; comprising a capital old-fashioned family residence, containing dining and drawing rooms, numerous bed rooms, and servants' offices, stable-yard, with coach-house, stal ing, and brewhou e. Adjoining the residence is a conservatory, leading to the lawn and pleasure-grounds, kitchen garden, and paddock, with pond of water, the whole containing about six acres. The views from the property over London are most extensive and from the great frontage, both to Highgate-hill and Maiden-lane, presents one of the most eligible building sites ever offered. The estate is full of brick earth and road, being near the wood, and might be readily converted to bricks prior to building on the property. May be viewed by cards only, which, with particulars and plans, may be had of D. Stevens, Esq. Solicitor, Gresham-street, City; at Garraway's; and at the Offices of Messrs. FAREBROTHER, CLARK, and LYE, Lancaster-place, Strand.

PADDINGTON.—To Timber Merchants, Builders, Carpenters, Cabinet-makers, and Others.

MR. LEREW will SELL by AUCTION, on the PREMISES, Irongate Wharf, Praed-street, on MONDAY, AUGUST 25th, at TWELVE, the well-assorted STOCK, comprising 2,000 pieces white, red, and pine planks, deals, and battens, 200 squares of prepared flooring, 6,000 feet scantling, 8,000 feet wide pine board, ninety four-panel and other doors, six cot sash, seven heads of oak sash, and other lots. May be viewed on Saturday prior and morning of Sale; and catalogues had on the Premises, and of the Auctioneer, Cardington street, Hampstead Road.

MINORIES.—Building Materials and Fittings of a Baptist Chapel, Pews, Pulpit, Rostrum, Windows, Doors, &c.

PULLEN and SON will SELL by AUCTION, on the PREMISES, on FRIDAY, AUGUST 29th, at TWELVE, in lots, by order of the Directors of the London and Blackwall Railway Company, all the valuable BUILDING MATERIALS and FITTINGS-UP of the BAPTIST CHAPEL in Little Prescot-street, Minories; comprising good sound brickwork, large quantity of pantiles, Flat oak an. Deal cei ing roof and floors, glazed sashes, doors, flooring-boards, about 100 feet run of wainscot pewing, with desks, panelled dados, architraves, erection and fittings of gallery, capital iron tank, 7 feet 6 inches by 5 feet, eight-day dial, hot-air stove, gas-fittings, and useful fittings-up. May be viewed the day previous, and catalogues had of Mr. ALLEN and Son, 85, Fore-street, Cripplegate.

SALES BY AUCTION.

PIMLICO IMPROVEMENT.—Building Materials.—King's-row, Pimlico.

MR. W. R. GLASIER is instructed by the Commissioners of Her Majesty's Works and Public Buildings to SELL by AUCTION, on the PREMISES, on TUESDAY AUGUST 19th, at TWELVE, the ONE, the BUILDING MATERIALS of SIX large HOUSES, being the Goat public-house, Arabella-row, and Nos. 1, 2, 3, 4, and 5, King's-row; three small houses in Arabella-row; and six small houses in Queen's-court, comprising 50,000 capital stock bricks, several tons of lead, in gutters, pipes, flats, &c. cast al flooring, doors, sashes and frames, dados, &c slating, pan and plain tiles, stone coping, Yorkshire and other paving, and the usual fittings and fixtures.—May be viewed the day prior and morning of Sale, and catalogues had at the Office of Works, 12, Whitehal l-place, of JAMES PEPPERCORN, Esq. 7, Whitehall-yard; at Garraway's; or on the Premises; and of the Auctioneer, 41, Charing cross.

DERBY.—To CONTRACTORS and BUILDERS.—BANKRUPTS' EFFECTS. Eight-horse power pumping engine on wheels, pile-driving machine, travelling crab with crane, centrifugal pump to throw up 500 gallons per minute, two treble-action cast iron pumps, with driving-wheel complete, twelve double and single action iron pumps, iron and wood pumps, eighteen 4-inch and other cards, timber drays, stone trolleys, derricks, 3,000 foreign poles and 3-inch scaff le-planks, 120 wheelbarrows, cart-horses, fifteen sets of shaft gears, with an immense variety of other property, described in catalogues, TO BE SOLD by AUCTION, on TUESDAY and WEDNESDAY next, the 19th and 20th of AUGUST, on the PREMISES of Mr. Thomas Cooper, Builder, Derby, a bankrupt, by order of the assignees. To commence at ELEVEN each morning. Catalogues may be had of Mr. BRADLEY, Auctioneer, at his Offices, Cornmarket, Derby.

FOR SALE, to pay a Purchaser 8 per cent. several Ten-roomed Private DWELLING-HOUSES, held from the Freeholder for 99 years, and let for short terms to highly respectable tenants at 45l. per year, each subject to a small ground-rent. This property is situate within five miles of London, and lately completed.—For further particulars apply to Mr. J. C. HOOK, Land-agent, 13a, Great George-street, Westminster, where plans may be seen.

TO BUILDERS.—FARNHAM, near the Camp.—CARPENTER'S SHOP, YARD, and commodious DWELLING-HOUSE TO BE SOLD, eligibly situate at Farnham, within three miles of the permanent barracks now erecting at Aldershot for 20,000 men, and in the midst of a locality pressing hard upon the energies of the builders of the district to supply i s rapidly increasing wants, but of which highly advantage in prospects the present proprietor is unable, from severe indisposition, to avail himself. It has been in the family nearly a century, is a *bona fide* business, and will be with the attention of any young man about to commence.—To view, and for further particulars, apply to Mr. EVANS, Solicitor, Farnham.

TO BUILDERS and OTHERS.—A very eligible opportunity is offered to a Young Man desirous of commencing business, or an established one requiring to extend his premises.—The Very excellent PREMISES TO BE LET, consisting of a store for timber, parlour and kitchen on the ground floor, over which is a workshop (perfectly lighted) capable of accommodating several car enters, and above and counting-house, with fittings, &c. at a rental of 30l. per annum. The Stock, consisting of timber, ironmongery, five good benches, and tools of every description, to be disposed of at a valuation, worth about 60l. or 70l. The business has been established some years, but the late occupier is recently deceased.—For further particulars apply, by letter, to JOINER, care of Mr. McNeil, Stationer, 23, Moorgate street, City.

GROUND-FLOOR, Hanover-street, Hanover-square, TO BE LET, suitable for Architects, Artists, or other professional persons, having two front offices, and large room behind, now used as a Picture Gallery.—LAHEE, 65, New Bond-st et, Avent (1475).

WHARF TO BE LET.—To QUARRY PROPRIETORS, CONTRACTORS, STONE and SLATE MERCHANTS, and others requiring waterside premises.—TO BE LET (the remainder of a TERM of 21 YEARS), with good depth of water; also a substantial DWELLING and COUNTING-HOUSE, on the same, situate on the south side of the river, below bridge, with immediate possession. Rent low.—Apply by letter, with real name and address, to A. Z. Mr. Syrett's, Stationer, 57, Old Broad street, City.

WATFORD, HERTS.—FREEHOLD LAND, in Church road, near the railway station, TO BE SOLD, or LET in Building Leases. Apply to Mr. E. WILSHIN, Waxwell Farm, Pinner, Middlesex.

WILLESDEN, the only rural parish within five miles of London.—Some very desirable FREEHOLD LAND TO BE LET on BUILDING LEASES, adjoining the turnpike-road to Harrow, and within a few minutes' walk of the railway station. The ground can be subdivided, if desired.—For further particulars apply to RICHARD WRIGHT, Esq. 37, Lincoln's-inn fields

ELIGIBLE BUILDING GROUND to LET, suitable for third and fourth-rate villas, where the same are much required, within ten minutes' walk of the Camden road Station, on the North London Railway. Roads made, sewers and drains in. For particulars apply to J. WRIGHT, Esq. 25, Bedford row; and Mr. R. RICHARDSON, St. Paul's Lodge, St. Paul's-road, Camden New Town. Money advanced if required.

HAMPTON-COURT.—About EIGHT ACRES of BUILDING GROUND TO BE LET, on Ninety-nine Years' Lease, or SOLD, in small or large Plots, near the above palace and railway, at moderate rents and prices. An advance of say 50 per cent. on the outlay would be made to respectable parties taking a considerable frontage.—For terms, &c. apply to Mr. F LETT, Architect, 36, Essex-street, Strand.

WANTED to PURCHASE several eligible PLOTS of GROUND, to Build on, in or within four miles of London, north preferred. Plots must not be less than 30 feet frontage, and 60 feet deep (if single). Particulars, with price, to be sent to Mr. T. J. HILL, Architect, 15, Old-street, City-road.

GREAT GRIMSBY, LINCOLNSHIRE.—BUILDING LAND.—TO BE LET, on lease, on advantageous terms, very eligible SITES, for the erection of Villa Residences, and first-class houses. The situation is excellent, being on rising ground, commanding a fine view of the surrounding country, and close to the town. Plans may be seen, and particulars obtained, on application to C. AINSLIE, Architect, 16, Old Jewry-chambers, City.

CLAPHAM.—Elegant Freehold Villa Residences.—TO BE SOLD, by Private Treaty, at moderate prices, that elegant and compact substantially built detached FREEHOLD RESIDENCE, in Park-hill-road, Clapham, between Clapham New Park and Clapham Common, containing in all about 3 acres, and comprising entrance hall, dining-room, library, five good bed-rooms, and dressing-room, a two-stall stable and coach-house, with rooms above, and garden in the rear. Now let for a term of 21 years, at 100l. per annum, but by an arrangement with the tenant, possession will be given to the purchaser if required. Also, Two Freehold semi-detached Italian Villas close to the above, containing kitchen and cook and drawing rooms, library, seven good bed-rooms, and dressing-room, and garden in the rear.—Apply to Mr. JOHN BARTON, House Agent, 31, Park-road, Clapham; or to THOMAS JOHNSTON, Esq. 5, Raymond-buildings, Gray's-inn.

TO BUILDERS AND OTHERS.

CLAPHAM-COMMON.—TO BE SOLD or LET (with the option to purchase hereafter), FREEHOLD LAND in this very superior and delightful locality, in plots, suitable for the erection of villa and other first class residences.—Apply by letter, post paid, to A. B. care of Mr. Evans, Stationer, &c Clapham Old Town.

FREEHOLD LAND FOR SALE.—12½ ACRES at East Barnet, situate on an eminence, with frontage on high road, and commanding delightful and extensive landscape views of the surrounding country. It is peculiarly eligible for building purposes, being easy of access from Town by omnibus or railway, and is suitable for the erection of villas for gentlemen desirous of enjoying the comforts of retirement in the country. Apply to Mr. BICKELL, 70, Goswell road.

FREEHOLD LAND TO BE LET, on Building Lease for ninety nine years. Money advanced to responsible parties. Freehold Land to be Sold for building purposes, in eligible situations.—Apply at the Offices of Messrs. MORGAN and PHIPSON, Architects, 3, Danes-Inn, St. Clement's, Strand.

FREEHOLD LAND TO BE LET, on the river Thames, between the river and the Victoria Docks, Lesney very near the dock entrance, on building leases for ninety-nine years. This land has not only the advantage of river frontage, but it is bounded on the land side by a branch of the Eastern Counties Railway, into which sidings can be made.—Plans of the property may be seen, and particulars had of Mr JOHN OAKLEY, Land Agent and Surveyor, No. 60, Doughty-street, and of Messrs. KINGSFORD and DORMAN, Solicitors, No. 25, Essex-street, Strand, London.

FREEHOLD or LEASEHOLD PROPERTY.—The Vestry of St. George the Martyr, Southwark, are desirous of obtaining a suitable SITE in the Parish, for the purpose of erecting a VESTRY-HALL, or premises already built, which can be adapted for such purpose. Persons willing to dispose of the same by sale or otherwise, are requested to send full particulars thereof, to Mr. F. TRITTON, Vestry Clerk's Office, No. 49, Bridge House place, Newington-causeway.

FREEHOLD LAND, TO LET, on building lease. The Rev. WILLIAM FORD and Mr HENRY WEBBER, executors of Richard Basford, esq. late of Tollington-park, have to offer TWO valuable PLOTS of FREEHOLD LAND, for building leases, for a term of ninety years, in Barford-street, Liverpool-road, Islington. The Land-tax is redeemed, and the sewer is made For particulars apply to Mr. HENRY WEBBER, Timber Merchant, 31, Old street, St. Luke's.

FREEHOLD and other LAND to be LET, on Building Lease, situate at Wandsworth, Croydon, and Norwood. Also districts required in 1000l. 2000l. 3000l. 4000l. 5000l. 6000l. and several small sums.—Apply to W. J. HOLT, Esq. Solicitor, 13, Chatham-place, Blackfriars. Agents need not apply.

VALUABLE SITE for BUILDING; TO BE LET, or SOLD.—The Directors of the Western Bank of London are prepared to receive TENDERS for the SURPLUS BUILDING GROUND, in BROOK-STREET, adjoining the Bank and Manager's House. Portion of the ground laid out in addition to Messrs RYMER, MURRAY, RYMER, and JACKSON, 12, Hanover-street, Hanover square, to whom the Tenders may be addressed.

BUILDING LAND, in eligible situations. One lot is in Kentish-town, partly covered; the other is at a railway station, eight miles from town, where there is an excellent opening for a Coal and Public-house and Stabling, at the Station-gate. And also for semi-detached VILLAS. TO BE LET, at 20l. to 35l. per annum. Money could be had if required.—Apply to THOMAS NUNN and SONS, 21, Lamb's Conduit-street, Foundling Hospital.

FINCHLEY.—LAND fronting the Regent's Park-road, and East-end-road, TO BE LET on Building Leases for ninety years, with power of enfranchisement. Plots from one to four acres for large villa residences; smaller plots for semi-detached houses, and plots for shops in the village. Apply to W. A. BOULTON'S, Esq. Architect, 5, Waterloo-place, Pall-mall; or to Messrs. BARKER, BOWKER, and PEAKE, 1, Gray's-inn-square.

BUILDING LAND TO BE LET, at HALLEVILLE.—Term 1,000 years, for small cottages.

CANNING TOWN	1,000	for small cottages.
NORWOOD	1,000	for villa residences.
SUTTON	100	for small cottages.
POPLAR	99	for fourth-rate houses.

Advances 70l. to 80l. at 5 per cent. on each cottage.
Apply to Mr. Wm. ELLISON, Architect, Stainsby-road, Limehouse.

STRATFORD, ESSEX. — FREEHOLD LAND, within three miles of London, excoriated from land tax, TO BE LET, on Lease, for a long term of years, in large or small plots, suitable for manufactories or building purposes.—Apply to Mr. W. H. DEAN, Auctioneer and Surveyor, Stratford; or to Mr. GEORGE POWNALL, Surveyor, 37, Bloomsbury-square, London.

NEW WINDSOR ESTATE. — Valuable BUILDING LAND TO BE LET, in Plots for first and second class Villa Residences, with Stabling, which are much needed in this beautiful locality. The situation is the finest in or near Windsor, abutting on the Park and Long Walk, and commanding a splendid view of the Castle. Within ten minutes of the Great Western and fifteen minutes' walk of the South-Western Railway Stations. Advances can be had by responsible parties.—For particulars apply to Mr. WILLIAM SIM, Architect and Surveyor, 3, Danes-Inn, Strand.

WANTED to PURCHASE, a BUILDING SITE or PREMISES in London, west of Temple-bar (either freehold or long leasehold), in or near a leading thoroughfare in a central situation, suitable for a charitable institution.—Letters (post paid), stating full particulars, to be addressed to Mr. E. GOULD, 8, Craig's-court, Charing-cross.

BERKHAMPSTEAD. — FREEHOLD LAND. TWELVE PLOTS for SALE, adapted for villas of moderate size; soil, situation, and aspect rarely equalled. A first class Villa will be let for twenty one years if required to persons building houses of a suitable character, and of the value of 50l. a year. Fine Free Grammar School also within very great advantages to residents.—For a plan of the land and further particulars, apply to Mr. BALDWIN, High-street, Berkhampstead.

WHARFS and STORES in the Adelphi.—TO BE LET, for a term, or by the year, together or separately, TWO WHARFS, each having house, counting house, stores, and stabling; one with dock for fifteen barges and the other for twenty-five barges, and each with a dry-dock. Rent moderate. Possession immediate. Reference for further particulars to be made to Mr. C. PALMER, General Railway Office, 41, Gresham street, City.

LONDON. Printed by CHARLES WYMAN, of 13, Hunter-street, Brunswick-square, in the Parish of St. George, Bloomsbury, Printer, at the Printing-office of COX (Bros.) & WYMAN, 74 & 75, Great Queen-street, Lincoln's-inn-fields, in the Parish of St. Giles-in-the-Fields; and published by the said CHARLES WYMAN, at the Office of "THE BUILDER," in York-street, in the Parish of St. Paul, Covent Garden, all in the County of Middlesex.—Saturday, August 9, 1856.

COMPETITIONS.

KNARESBOROUGH UNION.—To ARCHITECTS and OTHERS.—The Guardians of the Knaresborough Union are desirous of procuring PLANS for the ERECTION of a WORKHOUSE, to accommodate 200 Inmates, classified according to the requirements of the Poor Law Board. To be sent in on or before the 1st day of SEPTEMBER next. A Premium of 50l. will be given for the approved plan.—For particulars apply to

EDWIN SMITH, Clerk to the Guardians.

Knaresborough, 6th August, 1856.

TO ARCHITECTS.—BOROUGH of NEW WINDSOR.—Notice is hereby given, that the Council of this Borough, as the Board Board thereof, are ready to receive PLANS and DESIGNS for TWO CHAPELS, a CURATOR'S HOUSE, and ENTRANCE-GATES, and the WALLS and FENCES, which will be required to be erected on the Burial-ground for this Borough. The Council do not pledge themselves to adopt any of the plans and designs which may be furnished, but should any of them be adopted, and the architect preparing the same not be employed in carrying out the works, he will be paid 10l. for the plans and designs, and the rest of the plans, &c. will be returned to the various parties within fourteen days after the same shall have been delivered to me. All plans and designs must be delivered to me on or before TWELVE o'clock, on MONDAY, the 25th day of AUGUST instant. A plan of the ground may be seen, and all further information obtained, at my Office, Pilgrim-place, Windsor.—By order.

HENRY DARVILL, Town Clerk.

Windsor, 8th August, 1856.

CONTRACTS.

NOTICE to BUILDERS.—CONTRACT for the ERECTION and COMPLETION of a MILITARY HOSPITAL, with Outbuildings and Enclosure Wall, at Sheerness. The Commanding Royal Engineer gives Notice that TENDERS will be received at the Office of the Director-General of Contracts, Pall-mall, London, on or before THURSDAY, the 21st day of AUGUST, 1856, from such persons as may be desirous of CONTRACTING for the ERECTION and COMPLETION of a SOLDIERS' HOSPITAL, with OUTBUILDINGS and ENCLOSURE WALL, at Sheerness. The plans may be seen, and printed specifications and forms of Tender obtained, by persons willing competent to undertake the work (none others need apply), at this Office, between the hours of TEN and FOUR o'clock, from THURSDAY, the 7th, till WEDNESDAY, the 20th of AUGUST, 1856, Sundays excepted. The party whose Tender may be accepted will be required to enter into a bond, with two eligible securities, jointly and separately, to be bound under a penalty of 3,000l. for the due performance of the contract. Tenders for the above works to be addressed to "The Director-General of Contracts, Pall-mall, London," and endorsed "Tender for Military Hospital, Sheerness." No Tender can be admitted after the said 21st day of AUGUST, 1856.

N.B.—The War Department reserve to themselves the right of rejecting the whole or any of the Tenders.

Royal Engineer Office, Sheerness, Aug. 2, 1856.

NOTICE to PAINTERS, CONTRACTORS, and OTHERS.—ROYAL ENGINEER CONTRACT.—The War Department being about to enter into a CONTRACT for PAINTING the Exterior Woodwork, &c. of the buildings, &c. of the Royal Artillery Barracks at Woolwich: Such persons as may be desirous of Tendering for the same may inspect the specification, and receive every necessary information relative thereto, by applying to Mr. CARTWRIGHT, Clerk of Works at the Royal Engineer Office, Grand Depôt, Woolwich, between the hours of TEN and FOUR, up to the 23rd AUGUST, 1856.—Tenders to be delivered at the Office of the Director-General of Contracts, War Department, Pall-mall, London, on the 25th of AUGUST, 1856. The War Department reserve to themselves the right of rejecting the whole or any of the Tenders.

Grand Depot, Woolwich, 6th August, 1856.

CONTRACTS.

TO BUILDERS.—Notice is hereby given, that TENDERS will be received by the War Department, at their Office, Pall Mall, London, on THURSDAY, the 28th day of AUGUST, 1856, from such persons as may be willing to undertake the ERECTION of a BARRACK for Married Soldiers, with OUTBUILDINGS, &c. at Portsea, in the county of Hants. The plans, specification, and conditions of Contract, may be seen, and every information obtained, on application at this Office, on and after the 11th AUGUST, 1856, but not on the hours of TEN and FOUR each day (Sundays excepted). Tenders to be endorsed, "Tender for the Erection of a Barrack for Married Soldiers, with Outbuildings, &c. at Portsea, in the county of Hants."

Royal Engineer Office, Portsmouth, July 30, 1856.

WAR DEPARTMENT.—Such Persons as may be desirous of TENDERING for the SUPPLY and ERECTION of a GAS HOLDER and TANK, with FITMENTS complete, at the Royal Small Arms Factory, Enfield Lock, may receive information relative thereto, by application at the Royal Engineer Office, Enfield Lock, up to the 25th AUGUST, 1856. Tenders to be delivered on the 26th AUGUST, 1856, addressed to the Director-General of Contracts, War Department, Pall-Mall. The War Department reserve to themselves the right of rejecting the whole or any of the Tenders.

Royal Engineer Office, Enfield Lock, August 11, 1856.

TO BUILDERS.—Notice is hereby given, that TENDERS will be received by the War Department, at their Office, Pall-Mall, London, on MONDAY, the 8th day of SEPTEMBER, 1856, from such persons as may be willing to undertake the ERECTION of a BOMB-PROOF MAGAZINE, to contain 10,393 Barrels of Gunpowder, at Tipner, near Portsmouth, in the county of Hants. The plans, specification, and conditions of Contract, may be seen, and every information obtained on application at this Office, on or after the 18th day of AUGUST, 1856, between the hours of TEN and FOUR each day (Sundays excepted). Tenders to be endorsed, "Tender for the Erection of a Bomb-Proof Magazine, at Tipner, near Portsmouth, in the county of Hants."

Royal Engineer Office, Portsmouth, August 7, 1856.

CARDIFF, GLAMORGAN.—TO BUILDERS.—Persons desirous of TENDERING for the ERECTION of TWO first-class semi-detached VILLAS at Cardiff, with walls, offices, &c.; also for TWO other VILLAS of similar character in same town; also for THREE HOUSES connected together, with walls and offices in same town, may see drawings and specifications, and obtain quantities, at the Offices of the Architects, Messrs. W. G and E. HABERSHON, 38, Bloomsbury-square, London; or at their local Offices at Newport, Monmouth, by application to their resident clerk, Mr. DIXON; or at Cardiff, to their resident clerk, Mr. FAULKNER, on or after AUGUST 8th. Tenders to be delivered to Architects at Cardiff, on THURSDAY, AUGUST 28th, who do not bind themselves to accept the lowest or any of the Tenders.

ABERGATE, NOTTINGHAM, and BOSTON and EASTERN JUNCTION RAILWAY and CANAL COMPANY.—Persons desirous of CONTRACTING for the ERECTION of the GOODS WAREHOUSE proposed to be built at the Nottingham Terminus, are informed that the drawings and specification may be seen at the Offices of Mr. T. C HINE, Nottingham, from AUGUST 11th to the 30th inclusive. Sealed Tenders, addressed to the Secretary, to be delivered at the Company's office, Saint Peter's-gate, Nottingham, on or before AUGUST 23th. Printed quantities will be supplied by the Architect, at whose Offices particulars may also be obtained relative to the Contracts for the booking and parcels-offices, refreshment-rooms, &c.

THOMAS C. HINE, Architect.

The lowest Tender not necessarily accepted.

Nottingham, 9th August, 1856.

TO PUBLIC COMPANIES, CONTRACTORS, and OTHERS.—DEODORIZING SEWAGE.—The Southampton Local Board of Health, being desirous of avoiding the discharge of the contents of the SEWERS into the Tidal Waters, hereby give Notice, that they are willing to enter into ARRANGEMENTS, upon liberal terms, with any Public Company, or any responsible party, who may be disposed to ERECT the WORKS requisite for DEODORIZING the SEWAGE of the TOWN for the purposes of MANURE.—Further information may be obtained on application to Mr. ANTHONY MORGAN, the Superintendent of the Sewage Works; or of the Clerk, at the Public Health Office, Southampton.

CHARLES E. DEACON.
Clerk to the Local Board of Health.

Southampton, July 23, 1856.

TO BUILDERS. — CHELTENHAM COLLEGE. The Board of Directors of the Cheltenham College are willing to receive TENDERS for the ERECTION of a CHAPEL, in connection with the Institution. The drawings and specification may be seen and further particulars obtained at the Office of Mr. DANIEL JAMES HUMPHRIS, Architect, Cheltenham. The Tenders, which are to be sealed, and endorsed "Tender for New Chapel Cheltenham College" must be delivered at the New Office of the Secretary, on or before the 1st day of SEPTEMBER next.—The Directors do not pledge themselves to accept the lowest Tender.

D. J. HUMPHRIS, Architect

London road, Cheltenham.

BRECON. — To BUILDERS. — Persons desirous of TENDERING for the RESTORATION and ENLARGEMENT of the Parish Church of St. Mary, Brecon, may see the plans and specifications, and obtain copies of the quantities, at the Office of the Architect, 38 Bloomsbury-square London; or at their local Offices at Newport or Cardiff respectively; and also at Brecon, on or after AUGUST 12th. Tenders to be delivered to the Architects, at Brecon, on TUESDAY, AUGUST 26th, at HALF-PAST TWO o'clock precisely, who do not bind themselves to accept the lowest or any of the Tenders.

CONTRACTS.

TO BUILDERS.—EAST and WEST KENT MILITIA STORE HOUSES, to be built at Canterbury and Maidstone.—Persons desirous of CONTRACTING with the Lords-Lieutenant of the County of Kent for the ERECTION of MILITIA STORE-HOUSES, at Canterbury and Maidstone, may inspect the plans and specifications, and obtain all other information, at the Office of the County Surveyor at Maidstone, on and after THURSDAY, the 14th instant, for the West Kent; and at the County Sessions House at Saint Augustine's, for the East Kent, on and after MONDAY, the 18th instant; and they are requested to deliver Tenders for the said works to the County Surveyor at Maidstone, sealed and marked, "Tender for Militia Store-houses," before FIFTEEN o'clock in the forenoon of SATURDAY, the 30th day of AUGUST instant, and to attend personally at the General Sessions, to be holden at the Court house at Maidstone, at HALF-PAST TWELVE o'clock in the afternoon of that day. The lowest Tender will not necessarily be accepted, unless approved in all respects. Security will be required for the performance of the contract, and the names of the sureties proposed are to be named in the Tender.

H. A. WILDES, Clerk of the Peace for Kent.

Maidstone, August 6, 1856.

N.B. The quantities will be furnished.

TO CONTRACTORS.—The Local Board of Health for Kingston-upon-Hull having determined to let the execution of ALL WORKS by CONTRACT, are prepared to receive TENDERS from parties willing to undertake the following WORKS for STREET PAVING and SEWERING, viz.:—

About

7,600	yards super. of	Foundations to Roadways.
4,760	"	Paved Roadways.
3,900	"	Macadam Roadways.
4,500	"	Tooled Yorkshire Flagging and Flags, reland.
1,500	"	Asphalted Footways.
3,100	yards lineal of	Channels and Edge Curb.
300	"	Glazed Fireclay Pipe Sewers.

Together with other Works, such as Manholes, Stormgrates, and Gullies, &c. &c. connected therewith. Certain materials for the above will be supplied by the Board, and the works may be Tendered for in one or more Contracts. The drawings may be inspected, and every information obtained, at the Offices of the Surveyor to the Board, on and after MONDAY, the 11th inst. and until MONDAY, the 25th inst. when all Tenders must be delivered in, sealed, suitably endorsed, and addressed to the undersigned, on printed copy of the specifications, with form of Tender, schedule of prices and abstract of quantities, may be had upon payment of 3s. The Board does not bind itself to accept any Tender, and the Tender accepted will have to be guaranteed by sufficient sureties, in the sum of £ being 1/4 of the contract.—By order of the Works Committee,

JAMES NEWMAN, C.E. Surveyor to the Local Board.

Salcoates-Hall, Hull, 4th August, 1856.

THE GREAT NORTHERN RAILWAY COMPANY. To CONTRACTORS and BUILDERS. The Directors are prepared to receive TENDERS for the ERECTION of FIFTY COTTAGE DWELLINGS, at Peterborough, near Peterborough. Parties disposed to Tender may obtain the drawings, specification, and form of Tender (on which form only Tenders will be received), on payment of 5s. per set, upon application at this Office, on or after WEDNESDAY, the 6th AUGUST. Tenders sealed up and marked "Tenders for Cottages," must be lodged at this Office before TWELVE o'clock at noon on TUESDAY, the 26th AUGUST instant, when parties tendering must be in attendance.

N.B.—The Directors do not bind themselves to accept the lowest or any Tender. By order,

J. R. MOWATT, Secretary.

Secretary's Office, King's-cross Station, London, 5th August, 1856.

COUNTY of WORCESTER.—To BUILDERS and OTHERS.—Persons desirous of TENDERING for the several WORKS required in taking down the present and erecting a NEW EAST WING, also for the erection of a THREE-CLASS DEBTORS' PRISON, at the Worcester County Gaol, may inspect the drawings and specifications, and obtain any information in reference to the same, at my Office, 47, Foregate-street, Worcester. Sealed Tenders to be forwarded free of expense to the County Gaol, on or before FRIDAY, the 29th inst. endorsed "Tender for East Wing and Debtors' Prison." No pledge is given to accept the lowest or any Tender, unless satisfactory.

HENRY ROWE, Jun. County Surveyor.

Worcester, August 7th, 1856.

TO DUST CONTRACTORS.—The Vestry of the Parish of Chelsea will meet at the Board-Room, Manor House, King's-road, Chelsea, on TUESDAY, the 2nd day of SEPTEMBER next, at ELEVEN o'clock in the forenoon, precisely, to receive TENDERS from persons willing to contract from the 25th day of SEPTEMBER next, up to and including the 25th day of SEPTEMBER, 1857, pursuant to the terms of a Draft Contract now lying at my Office as above, for COLLECTING and REMOVING the DUST, ASHES, and RUBBISH from the houses and other places within one or more of the several districts within the said parish. Sealed Tenders to be sent to the proposed Contractor, with the names and descriptions of two sufficient sureties for the performance of his Contract, to be left at my Office, on or before SATURDAY, the 30th instant. The lowest charges of the Contract to be paid by the Contractor upon the quantity of the same. The Vestry do not bind themselves to accept the lowest or any Tender; and none will be received or less made in one of the printed forms to be obtained at my Office, on application.

CHARLES LABEL, Vestry Clerk.

Offices of the Vestry, Manor House, King's-road, Chelsea, August, 1856.

TO BUILDERS and OTHERS.—Persons willing to CONTRACT for the ERECTION of a HOUSE, &c. at Lee, in Kent, may see plans and specification on MONDAY next, at Mr. GEO. GATES, Surveyor, 8, Eton grove, Lee.

[For remainder of Contracts see next page.

CONTRACTS.

FILEY WATERWORKS COMPANY.—To CONTRACTORS.—The Directors of the Filey Waterworks Company are desirous of receiving TENDERS for the CONSTRUCTION of a RESERVOIR capable of containing about 4000 gallons of water and their work in Rochdale, situated one mile from the Hunmanby station, on the North Eastern Railway, and one mile from the sea-beach. The plans and specification will be open for inspection of parties willing to Tender, and after the 18th day of AUGUST, 1856, at the Office of Mr. JOSIAH F. FAIRBANK, Civil Engineer, of Scarborough, to whom Tenders must be sent, endorsed, "Tender for Reservoir at Rochdale," on or before MONDAY, the 1st day of SEPTEMBER, 1856. No pledge is given that the lowest Tender will be accepted, although the Directors will do so, unless there is a sufficient reason to the contrary. A printed copy of the specification, with form of Tender, may be obtained on payment of ten shillings.—By order of the Directors.

JOSIAH F. FAIRBANK, C.E.
Engineer to the Filey Waterworks Company.

Scarborough, August 5 th, 1856.

RICKMANSWORTH CEMETERY.—To BUILDERS and CONTRACTORS.—Notice is hereby given, that it is the intention of the Burial Board for the Parish of Rickmansworth, in the County of Hertford, to enter into a CONTRACT or CONTRACTS for the ERECTION and COMPLETION of a DWARF-WALL, with OPEN IRON RAILING, forming a fence round the burial-ground, which comprises two acres, under the Burial Acts. The plans, drawings, and specifications can be seen at the offices of the Clerk to the Board, at Rickmansworth aforesaid, on and after MONDAY, the 11th instant. Any person or persons willing to undertake the said Contract or Contracts is or are invited to send in a Tender or Tenders directed to the Clerk to the said Board at Rickmansworth aforesaid on or before THURSDAY, the 4th day of SEPTEMBER next.—The Board do not pledge themselves to defray any expenses incurred in the preparation and submission of the said Tender or Tenders, nor to accept the lowest or any one of such Tender or Tenders in particular.

Rickmansworth, 6th August, 1856.

MACHINERY-TOOLS, &c.—The DOVER LOCAL BOARD of HEALTH are willing to receive TENDERS for the supply of certain MACHINERY TACKLE and TOOLS required for their Water and Drainage Works at Dover. Copies of the Schedules, with lists of the articles required, may be obtained on application at my office. Further particulars may be had at the Office of the Surveyor of the Local Board. Tenders to be delivered at my Office on or before WEDNESDAY, the 27th instant.

T. B. BASS, Town Clerk.

Dover, 8th August, 1856.

COUNTY of DURHAM LUNATIC ASYLUM.—To BUILDERS, ENGINEERS, CONTRACTORS, and OTHERS.—The Committee of Visitors are prepared to receive TENDERS for the whole or any part of the several WORKS required to be done in the ERECTION of the County of Durham LUNATIC ASYLUM, near Sedgefield, in the county of Durham. The plans, specifications, and conditions may be inspected at the Office of the Architect, Mr. JOHN BOWES, Grand Court, Durham, where further particulars may be ascertained, and of whom detailed measurements and form of Tender may be obtained. Sealed Tenders endorsed "Tender for County Lunatic Asylum" addressed to ROWLAND BURDON, Esq., Chairman of the Committee of Visitors must be sent to Mr. HODGSON'S offices, on or before TUESDAY, the 23rd day of SEPTEMBER next. The party whose Tender may be accepted will be required to enter into a bond, with two satisfactory sureties, for the due performance of the contract. The Committee do not pledge themselves to accept the lowest or any Tender.

JOHN WATSON, Clerk to the Committee.

Durham, July 28th, 1856.

TO CONTRACTORS. — WAVERTREE LOCAL BOARD of HEALTH.—The Wavertree Local Board of Health are desirous to receive TENDERS for the CONSTRUCTION of SEWERS within the district of the Local Board of Health of Wavertree according to the plans and specifications prepared for the purpose. Tenders to be sent in addressed to "The Chairman of the Wavertree Local Board of Health, Public Offices, Wavertree, near Liverpool," according to the usual form, and delivered at the Office of the undersigned, before the hour of MONDAY the 25th day of AUGUST instant. The plans and specifications may be inspected at the Office of Mr. ISAAC ATHERTON, Solicitor, Liverpool, and copies obtained from him by MONDAY the 18th instant, where forms of TENDERS may be obtained on application. A large quantity of good Arch Bricks may be obtained within a mile of the sewers to be constructed. The Board do not pledge themselves to accept the lowest or any Tender.

ISAAC ATHERTON, Law Clerk.

Prince's Buildings, North John-street, Liverpool,
August 12, 1856.

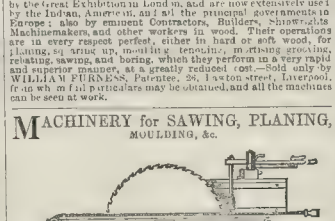
A
FIRST-CLASS MEDAL
WAS AWARDED TO
F. EDWARDS, SON, and CO.
AT THE
PARIS EXHIBITION,
For the SPECIMENS they exhibited of
DR. ARNOTT'S
SMOKE-CONSUMING GRATE,
AND SMOKE-CONSUMING
COOKING APPARATUS.

F. EDWARDS, SON, and CO. beg to inform the public that their STOCK of GRATES is ENTIRELY REFORMED, and consists SOLELY of GRATES on the SMOKE-CONSUMING PRINCIPLE. A large variety in real Bronze, Ormolu, Steel, and Berlin Black, suitable for Drawing-rooms, Dining-rooms, and Libraries, from 7l. to 30l.

The following are the prices of those for ordinary use:—
Black Grates, for Parlours, Offices, &c. from 4l. to 8l. 10s.; for Bed-rooms, Offices, &c. from 2l. 10s.



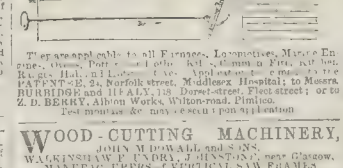
By the Grates on this principle, as properly constructed by F. Edwards, Son, and Co. smoky chimneys are avoided, an arrestable fire is maintained, with one-half the trouble attending the ordinary grate, and a saving of from forty to fifty per cent is effected in the consumption of fuel.

PROSPECTUSES, WITH FULL PARTICULARS AND TESTIMONIALS, SENT ON APPLICATION.

To be seen in daily operation at the Show Rooms, 42, Poland-street, Oxford-street, London.

PATENT MACHINES for WORKING in WOOD.—These celebrated Machines have been awarded a number of prize medals in many cases in the countries, and also by the Great Exhibition in London, and are now extensively used by the Indian, American, and all the principal governments in Europe; also by eminent Contractors, Builders, Shipwrights, Machinemakers, and other workers in wood. Their operations are in every respect perfect, either in hard or soft wood, for planing, sawing up, moulding, tenoning, mortising, grooving, rebating, sawing, and boring, which they perform in a very rapid and superior manner, at a greatly reduced cost.—Sold only by WILLIAM FURNESS, Patentee, 26, Lawton-street, Liverpool, from whom full particulars may be obtained, and all the machines can be seen at work.

MACHINERY for SAWING, PLANING, MOULDING, &c.



SAMUEL WORSSAM and CO. beg to call the attention of Contractors, Shipbuilders, proprietors of Saw-Mills and others, to their improved Inventions and Adaptations in Saw Frames and Benches, Rolled and Chain Planing Machines, Endless Saw Frames, and all other kinds of Machines for Sawing, Planing, Moulding and Mortising Wood. They have on hand machinery, either wholly or partly made, so that they can at all times on short notice supply them. S. W. and CO. beg to state that they have in their employment their attendants to this sort of machinery, and have had the honour of supplying some of the most distinguished personages, public bodies, and contractors in the world with their machines, for home and foreign use. One of their Saw Benches and also a smaller one with Boring Apparatus, may be seen at the Machinery Department, Crystal Palace.

A descriptive Catalogue, with Drawings, may be had on application.

KING'S-ROAD, CHELSEA.

GARDNER'S PATENT STEAM GENERATOR and SMOKE CONSUMER produces dry steam with less than one-fourth of fuel, and entirely prevents smoke. These patented improvements are highly recommended for the economy, durability, and great economy. The are self-acting, have no main parts, therefore require no external aid.

They are applicable to all Furnaces, Locomotives, Marine Engines, Ovens, Potters' Kilns, Chemical Pots, Boiling, Raising, Hatching, Drying, and Heating Apparatus. Apply to PATENTEE, 24, Norfolk street, Middlesex Hospital; to Messrs. BURRIDGE and HEALY, 128, Dorset-street, Fleet street; or to Z. D. BERRY, Albion Works, Wilton-road, Pimlico.

Test models &c. may be seen upon application.

WOOD-CUTTING MACHINERY, JOHN M'DOWALL and SONS, WALKINSHAW FOUNDRY, RENFREW, near Glasgow, MANUFACTURERS of VERTICAL SAW FRAMES (brass bushed),

For cutting balks of timber, from 6 feet on the side down to the smallest deal frame.

Patent vertical saw-frames, of the foregoing dimensions, with [illegible] and [illegible] feed motions; patent [illegible] saw-guides; patent [illegible] saw-tables, [illegible] timber, planing apparatus for [illegible] boards from 4 to 12 inch thick to 6 inch deck planks; revolving planers, for squaring and shaping heavy timbers, as used by ship-builders, &c; patent curvilinear sawing machine, for resawing circular cutting, with adjustable [illegible] bevel bars; power for raising and turning logs; moulding machines, single and double; veneer mills of all sizes, with all appendages; scale-board machines, for hat-boxes, &c.; patent deck feed motions for saw-frames; and every description of machinery for cutting and shaping timber, all constructed on the best principles, and of the best materials, and for prices to suit the times. Mr M'Dowall has been in the employment of the above firm for upwards of eighteen years, and during the last 14 years has had the entire management, particularly to the manufacture of wood-working machinery, as referred to by the number of patents he has obtained for its improvement, and by the extensive orders his firm has been favoured with from the British and other European Governments and private establishments in almost all parts of the world; and from their large and commodious premises, and first-class plant made for every improved article of the work, with a retard to cost, the largest contracts can be executed with a regularity, accuracy, and despatch, which cannot be exceeded by any other firm in Europe. Applications as above for further particulars, will be promptly attended to.

D. HULETT and CO. Manufacturers of GAS CHANDELIERS, HALL LANTERNS, GLASS LUSTRES, &c. &c. A large assortment of the newest designs always on show—every article marked in plain figures. Patentees and manufacturers of the Mercurial Gas Regulator. Complete pattern-book and price list, 10s.—6s and 5s. High Holborn.

ZINC ROOFING, INCLUDING TIMBER OR IRON FRAMEWORK,

IS AS

CHEAP AS SLATES OR GALVANIZED IRON, LIGHTER, AND MORE DURABLE.

Certificates, and Models of various descriptions, may be seen, and estimates obtained on application to

THE SURVEYOR OF THE VIEILLE MONTAGNE ZINC MINING COMPANY, 12, MANCHESTER BUILDINGS, WESTMINSTER.

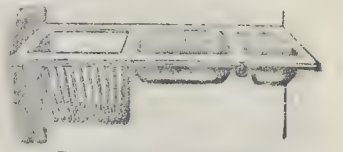
ROOFS CONSTRUCTED UNDER HIS SUPERINTENDENCE GUARANTEED TO REQUIRE NO REPAIRS FOR AT LEAST TEN YEARS.

THE OLD METAL BEING ALWAYS RETAKEN AT HALF-PRICE, RENDERS IT ADVANTAGEOUS FOR ALL TEMPORARY BUILDINGS.

Many roofs covered with zinc thirty-five years ago have never required repairs.

ST. PANCRAS IRONWORKS,

OLD ST. PANCRAS-ROAD, OPPOSITE THE OLD CHURCH, LONDON.



TO ARCHITECTS, ENGINEERS, BUILDERS, AND CONTRACTORS.

THE PATENT BOND (which is prepared from the ORDINARY HOOP IRON, by notching it at intervals of 1¼ inches) is now being extensively used in the leading GOVERNMENT WORKS DOCK BUILDINGS, BANKS, ASYLUMS, BRIDGES, VIADUCTS, PARISH, ENGINE HOUSES, and MANUFACTORIES, as well as in other PUBLIC and PRIVATE WORKS, in LONDON and in all parts of the KINGDOM.

Sole Manufacturers—THOMAS PERRY and SONS, Highfields Works, Bilston.
London Depôt—ST. ANN'S WHARF, EARL-STREET, BLACKFRIARS.

NEW PATENT INVENTIONS FOR STABLE REQUISITES,

AWARDED A PRIZE AT THE PARIS EXHIBITION, AND PATRONISED BY THE ENGLISH AND FRENCH GOVERNMENTS.

COTTAM and HALLEN, of Winsley-street,

Are the original inventors of the PATENT ENAMELLED MANGER, WATER-TROUGH, and WROUGHT-IRON RACK, united to an iron trough above, forming one complete and useful fixture having Cottam's Patent Vaseless Hay-cutting and Water Item attached, the ball of which is taken to the back of the manger, and works with ease and freedom up or down the guide bar. Cottam's new Patent Seed-Box, of galvanized sheet-iron, is an important addition to the above items, being simple in construction, neat and durable, promotes cleanliness, and is economical in its results. Also, the Patent Swivel and Harness Bracket combined, which can be used with great advantage where space is an object, as it can be turned up out of the way when not in use.

Improved Harness Holders, for preserving the shape of the harness, and preventing its crocking. Patent Loose-Box Fittings, Cheap and Durable Corn-Bins.

Improved Surface Drains, with safety covers, Sanitary Traps, and every article for the harness-room and stable, kept in stock, plain, galvanized, and enamelled. Iron Gates, Fencing, Hurdles, &c.

The new Illustrated Catalogue for 1856, and estimates grans, upon application to

COTTAM AND HALLEN, 2, WINSLEY-STREET, OXFORD-STREET.

FENDERS, STOVES, and FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS. They contain such an assortment of Fenders, Stoves, Ranges, Fireirons, and General Ironmongery as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with ormolu ornaments and two sets of bars, £4 4s. to £8 18s.; ditto, with ormolu ornaments and two sets of bars, £4 18s. to £12 12s.; Bronzed Fenders, complete, with standards from 7s. to £7; Steel Fenders, from £1 15s. to £6; ditto, with rich ormolu ornaments, from £2 5s. to £7 7s.; Fireirons, from 1s. 9d. the set to £1 4s. Sylvester and all other Patent Stoves, with the newest Improvements. All which he is enabled to sell at these very reduced Charges.

Firstly—From the frequency and extent of his purchases; and Secondly—From these purchases being made exclusively for cash.

Illustrated Catalogues sent (per post) free.

39, OXFORD-STREET; 1, 2, 3, and 4, NEWMAN-STREET; 4, 5, and 6, PERRY'S-PLACE, London. Established 1820.

TO ARCHITECTS, &c.—The IMPROVED SELF-ACTING WATER-BAR for FRENCH CASEMENTS, the best and most used one, yet invented, is made by T. SMITH, of 11, Queen-street, GOLDEN-square (near Argyll street), where a working model can be seen or will be sent for inspection on the shortest notice.

N.B.—Experienced Hands of a superior quality, at reduced prices.

REGISTER STOVES, with PATENTED IMPROVEMENTS.—DEANE, DRAY, and CO invite the attention of Purchasers to their Stock of STOVES for drawing and dining rooms; also, a large assortment of FAC'RONS, suitable for warehouses, offices, bed rooms, &c. In Fenders and Fire Irons, DEANE, DRAY, and CO are constantly introducing every novelty at the lowest prices.—DEANE, DRAY, and CO'S Stove, Range, and General Furnishing Warehouse, London-bridge.—Established A.D. 1700.

WARMING and VENTILATING.—ALFRED MAY begs to call the attention of Architects, Builders, and others to his system of WARMING by HOT WATER, Lowest Asylum Workhouses, Churches, and other Public and Horticultural Buildings, Mansions, and Offices.

A. M. having had great experience in the above line, is enabled to guarantee the effect not only of such work as may be entrusted to him for execution; he has just completed, to the entire satisfaction of the architects, the warming and ventilation of the Rooms and for Anthony Roth, Esq.'s new mansion on the Riverside.

Manufactory, 15, Pleasant-place, Deptford-bridge, and at 5, Devonshire-street, Queen's-square, Bloomsbury.

Architects supplied for drying linen on a very economical and efficient system.

HEATING BY  HOT WATER.

JOHN WEEKS and CO. King's-road, Chelsea, HOT WATER APPARATUS MANUFACTURERS. Buildings of every description, and of the most extensive dimensions, can be effectually warmed by Hot Water. JOHN WEEKS and CO can give innumerable references of Churches, Dwelling-houses, Warehouses, &c. &c. where they have fixed their Hot Water Apparatus. Also to be seen in extensive operation at their Premises, King's-road, Chelsea.

GURNEY'S WARMING APPARATUS.—This apparatus is a modification of that invented by Mr. Goldsworthy Gurney, and used for warming the House of Commons and House of Peers. It is now constructed so as to be available for private houses, churches, and other buildings. It is simple and inexpensive, combining the laws of conduction and convection of heat, to temper and warm air for respiration, without drying or reducing its natural hygrometric break.—For further particulars apply to Mr. WOODCOCK, 5, Bessborough-gardens, Pimlico, who will supply the apparatus, and is empowered to grant licenses for same, also under the patent.

IMPORTANT to CONTRACTORS.—DUPRE'S PATENT BAKER'S OVEN.—The undersigned is desirous of appointing AGENTS for all parts of the kingdom, to introduce the above. It is one of the most important inventions which has ever appeared before the public, as it not only bakes the bread better, but, from its economising principles, bread may be sold at a reduced price. The Patentee also begs to give notice, that having disposed of a portion of his patent to Mr. F. B. Bearne, Builder, of Newton Bushel, parties requiring ovens in that district will please apply to him.—For full particulars, apply to JOHN DUPRE, Plymouth.
See Model at Crystal Palace, or Society of Arts.

BATHS and HOT-WATER APPARATUS. J. TYLOR and SONS' ILLUSTRATED CATALOGUE of BATH WORK, &c. to be had on application. Estimates and Plans for Fixing given.—J. TYLOR and SONS, Manufacturers, Warwick-lane, Newgate-street, London.

JOHN TANN'S NEW PATENT RELIANCE LOCK and CHEMICAL-FILLED WROUGHT-IRON FIRE-PROOF SAFES, DOORS, ROOMS, &c. Manufactures of cash, deed, and paper boxes, copying and copying presses, letter balances, and every description of lever locks and street-door latches. To be had at the General Lock and Safe Warehouse, 30, Walbrook, City. Lists of prices on application.

A PRIZE MEDAL for SUPERIOR LOCKS was awarded to J. H. BOOBBYER at the Great Exhibition of 1851, who invites the attention of Builders, &c. to his Stock of Ironmongery, Brass Foundry, Nails (wrought and cut), Copper and Zinc; Patent Locks of all descriptions; China, Glass, and Wood Furnitures of all kinds, with Patent Shifting Spindles; Dr. Arnott's Ventilator, 4s.; and the new registered Venetian Ventilator, so much admired, &c. 6s. 6d. each.
J. H. BOOBBYER (late STURCH and BOOBBYER), established nearly 200 years, for the supply of Goods from the best Manufactories, at the lowest prices.
14, Stanhope-street, Clare-market, London.

CHUBB'S LOCKS, with all the recent improvements; STRONG FIRE-PROOF SAFES, CASH and DEED BOXES.—Complete lists of sizes and prices may be had on application.
CHUBB and SON, 57, St. Paul's-churchyard, London; 28, Lord-street, Liverpool; 16, Market-street, Manchester; and Hornsey-fields, Wolverhampton.

CITY CENTRAL SAWING, PLANING, and MOULDING MILLS, UPPER WHITECROSS-STREET, St. Luke's. WILLIAM BOOTH, Proprietor, thanks the Trade for liberal patronage, and solicits further favours. Particulars per post. Carts and teams to the Docks and Railway Stations daily. The central position of these Mills will be found most convenient. Omnibuses pass close by to all parts.

FIRE-PROOF CONSTRUCTION.—FOX and BARRETT'S PATENT.
This improved system of fire-proof construction has been most extensively adopted, and its application has been extended to nearly EVERY DESCRIPTION OF BUILDING, whether public or private.
The system combines ECONOMY, with great simplicity of construction, perfect security from fire, increased durability, and many other important advantages.
The floors and roofs are formed by a combination of joists of wrought or rolled iron with concrete; so constructed that each floor becomes in effect a beam of artificial stone, with ribs of iron; the structure possessing great strength and rigidity, and forming a fire-proof foundation adapted to receive a finished surface, either of the ordinary flooring-boards, or of cement, asphalte, tiles, slate, or other material.
Some of the largest and most important buildings in the kingdom are now in course of erection upon this principle, which is recommended to the notice of all who are interested in building, both as superseding the necessity for cast-iron girders and brick arches, and as bringing the great desiderata of fire-proof construction, even for ordinary dwelling-houses and domestic buildings, within the reach of every one.
Further information may be obtained of the Proprietor of the patent.—Mr. BARRETT, 13, York-buildings, Adelphi.

LIGHTNING CONDUCTORS.—R. S. NEWALL and CO. Patentees of the Copper Rope Lightning Conductor, supply Lightning Conductors, with the point and all staples complete for fixing, at one shilling the foot.
R. S. NEWALL and CO'S Patent Copper Rope Conductor is being adopted by architects, engineers, and scientific men in all parts of the world.
COPPER and IRON CORD for WINDOW SASH-LINES.

List of Prices had on application at the Warehouse, or by letter prepaid

JOHN WARNER and SONS, Patentees of IMPROVEMENTS in the MANUFACTURE of LARGE BELLS.
J. W. & SONS having of late years devoted much time and study to the long neglected art of Bell Casting, have recently invented and patented a new process connected therewith, by which they are enabled to manufacture Bells of any size, note, or weight, of superior tone, truer in form, and at less cost than has heretofore been accomplished.

Bells for Churches, Chapels, Colleges, Schools, Turret Clocks, &c. cast for any size, note, weight, singly or in peals.
TUNED BY MACHINERY.
Stocked and wheeled ready for fixing. Old Bells recast or taken in exchange.
MUSICAL HAND-BELLS tuned to the Chromatic Scale, with improved Clappers, and pegged on a new system which give superior tone and facility for ringing

SAVING IN GAS.—D. BULEIT, INVENTOR and PATENTEE.—The Mercurial Gas Regulator is the only efficient instrument for ensuring wholesome and uniform lighting, equalizing the pressure, and preventing any irregularity in the height of the flame.—D. BULEIT and CO. 55, High Holborn, London, Manufacturers of Gas Chandeliers, Glass Lustres, &c. &c.

TO IRONMONGERS, BUILDERS, &c.
PATENT WROUGHT-IRON WELDED TUBE for GAS; galvanized ditto for water; high-pressure cocks, &c. Manufacturers of Dr. Arnott's Improved Ventilators.
HULETT and CO. 55, High Holborn.

COLLINGE'S PATENT HINGES.—Manufacturers, CHARLES COLLINGE and CO. 64 and 65, Bridge-road, Lambeth, where a great variety are always on view for church, park, railroad, coachhouse, and other gates and doors of large and small dimensions, a ton weight moving with these hinges as easily as a wicket. Ornamental hinges, adapted for drawing-rooms, &c.; doors fitted with them may be removed and replaced in an instant. Rising and double-acting spring hinges, and superior gate fastenings, at moderate prices None genuine unless marked "Charles Collinge, Patent, Lambeth." Plain and ornamental cast and wrought iron-work, for building and other purposes. Engines, machinery, patent axle-trees, sugar-mills, &c.

VENTILATION.—J. KITE, Patentee for Ventilating and Smoke-curing Operations.—Churches, chapels, schools, club-houses, public buildings, stables, &c. effectually ventilated, upon a new and economic system. Also, the New Patent Albert Chimney Cap, for the cure of smoke. Patronised by her Most Gracious Majesty, 200 on Buckingham Palace; in use also on St. James's Palace, Claremont, Windsor Castle, Government buildings, &c. Wrought iron, 25s.; galvanized ditto, 30s.; cast iron, 35s. each, the latter as durable as the building itself. Illustrations and testimonials forwarded on receipt of two postage-stamps.—Depôt, BARTON'S Ironworks and Manufactory, for the Patent Stable Fittings and enamelled Mangers.—Address, JAMES BARTON, 370, Oxford-street, London.

TO BELL-HANGERS, GAS-FITTERS, IRONMONGERS, &c. &c.—The Trade supplied on the best terms with House Bells, Zinc, Tube, and Copper Wire. Gas Pendants, Brackets, and Joints of all descriptions for Gas-fitting, in Brass and Iron; Tin, Composition, Iron and Brass Tubing, Curtice-poles, Rings and Lacquered Case Tube for Picture Rods, Desk Rails, &c. &c.
Superior Rolled Brass for Engravers, Castings in Fine and Common Brass, Gun Metal, &c. at
RICHARD EVERED'S, Brass and Bell Foundry and Metal Warehouse, Nos. 10, 11, and 12, Charles-street, Long-acre, London.

TUPPER and CARR, Patent Galvanized and Ungalvanized CORRUGATED IRON MANUFACTURERS, IRON ROOF, SHED, AND STORE BUILDERS, Electric Telegraph and Wire Fencing Contractors.
Works—LIMEHOUSE and BIRMINGHAM.
Offices—3, MANSION HOUSE-PLACE, LONDON.
Iron of every description galvanized.

AUSTIN'S IMPERIAL PATENT SASH and BLIND LINE can be obtained of all ROPEMAKERS, IRONMONGERS, MERCHANTS, FACTORS, and WHOLESALE HOUSES, in TOWN or COUNTRY.
Established 1774.

TO BUILDERS, MASONS, AND OTHERS.

THE largest STOCK in England of MARBLE in Blocks and Slabs, veined, Bardilla, dove, black, black and gold, Sienna, St. Ann's, statuary, serpentine, verd antique, &c. Portland, Hardhill, Park Spring, and other stone, in blocks, slabs, landings, and headstones. Yorkshire paving, granite curb, &c. All goods carefully packed and forwarded to any part of England. THOMAS JACKSON, Marble and Stone Sawing-Mills, Commercial-road, Pimlico, London.

LLOYD'S MARBLE WHARF, Thames-bank, Pimlico, adjoining Vauxhall-bridge.—Italian Statuary, Veined, Sicilian, Devon, Sienna, and other Marbles, for Sale, at import prices. A resident manager on the wharf at all hours.

BUILDERS! ARCHITECTS! AND MASONS!

MARBLE.—The Italian Marble Company call the particular attention of Builders, Architects, Sculptors, and Masons to their PRESENT low prices, viz:—

Vein, in blocks of ordinary dimensions, 8s. 6d. per foot cube.
Sicilian " 6s. 6d. "

An inspection of their well-assorted stock is solicited, at "The Depôt," Bridge-wharf, Millbank, adjoining Vauxhall-bridge. Apply only to Mr. BAXTER, Wharf Foreman.

WILLIAM W. BONNIN, Secretary.

MARBLE CHIMNEY-PIECES.—The nobility and gentry of the United Kingdom who are building or refitting their mansions are respectfully invited to inspect the most Extensive Collection of MARBLE CHIMNEY-PIECES lately imported from the Continent. They comprise Statuary, Giallo di Sienna, Vert Rouge, Dove, Black and Gold, Rouge de Belmont, Bardiglio, and other choice foreign marbles; and are designed with great taste, and executed by first-class artists.—On sale, in the show rooms of Messrs. EVANS, SON, and CO. King William-street, London-bridge.

GRANITE.—King William and Nelson Monuments, Plinth and Steps of the Royal Exchange, and Terraces at the Crystal Palace.—Supplied by the Haytor Company under Royal Charter.—For terms, apply to Mr. C. HOAR, Haytor Granite Office, 4, Millbank-row, Westminster.

GRANITE.—The Cheesewring Granite Company, Liskeard, Cornwall.
London Agents—TREGELLES and TAYLOR, 54, Old Broad-street. Manager—JAS. J. TRATHAN, Liskeard.
This Granite is selected for the New Westminster-bridge.

WELSH GRANITE.—The Welsh Granite Company, Carnarvon, supplies Pitching or Paving Sets of this Material to order. The Sets, which have for several years been extensively used in Manchester, Bristol, and other large towns, combine in a higher degree than any others, the qualities of roughness in wear and durability. The stone is also well adapted for foundation courses, plinths, &c. for public buildings and for mill-stones; it will also take a fine polish.

GREEN MOOR STONE WHARF.—BROWN and BOOTH, 42, Bankside, Southwark, beg to invite Builders, Architects, Masons and the Trade, to the stock of STONE of all kinds; viz. Portland, Guernsey, Harehill York Paving, Landings, &c. &c.; the Green Moor stone in 12 cks, landings, quarry-worked steps, sinks, copings, cills, &c. &c. Sawn slab and headstones in Green Moor, Harehill, Robin Hood. The last attention given to all orders, and price-lists sent on applica tion at such prices to meet the wishes of all. The nearest wharf to the City and Surrey side of the water.

CAEN and AUBIGNY STONE.—P. FOUCARD, Stone Merchant and Quarryman. Cargoes shipped to order from Caen to any port. Contracts taken for any quantities. Depôts: Granite Wharf, East Cresswich; Lett's Wharf, Waterloo-bridge. Office: 246, High-street, Southwark, near the Townhall.

GAZEBY STONE from the original Quarries, in blocks and steps. 2,000 feet in stock at BROWN and BOOTH'S, 42, Bankside, Southwark.

GATES and GEORGE, CAEN, AUBIGNY, and GENERAL STONE MERCHANTS.
CAEN WHARF, ROTHERHITHE, LONDON.

RANDELL and SAUNDERS, QUARRYMEN AND STONE-MERCHANTS, BATH.

List of prices at the quarries and depots, also cost for transit to any part of the kingdom, furnished on application to Bath Stone Office, Corsham, Wilts

PARIS EXHIBITION. — ENAMELLED SLATE.—TWO FIRST-CLASS MEDALS!—Mr. MAGNUS is the only exhibitor whose productions received this double honour; also the Prize Medal at the Great Exhibition of 1851, and the Medal of the Society of Arts in 1848. This beautiful material, handsomer and more durable than marble, is now finding its way into palaces, into the mansions of the nobility at home and abroad, into the highest class of public buildings, as well as into humbler dwellings. The cost is immeasurably below that of any other production that can at all compete with it. It is applicable to a variety of useful and ornamental articles, too numerous to be separately specified. Among the chief are chimney-pieces and ornamental stoves for all apartments; plain and exquisitely decorated slabs for the tops of loo-tables, chiffoniers, consoles, &c.; baths; lavatories, slop-tablets, pilasters, columns, vases, pedestals, and brackets; wash-stand tops, billiard tables, linings to halls, vestibules, and dairies.—Price lists can be had on application to Mr. MAGNUS, 39 and 40, Upper Belgrave-place, Pimlico.
N.B. Plain slate work executed from a single article to the most extensive contracts, for home and abroad.

VALENTIA SLATE SLABS.—The Valentia Slab Company invite attention to their Slabs now supplied, of very large dimensions and of superior quality They have been used at the British Museum, National Gallery Bethlem Hospital, various Lunatic Asylums, the Ordnance Works Model Prison, Pentonville, and other Penitentiaries; Malting Floors in Bedfordshire and Hertfordshire, Breweries, the Race Stand at Brighton, Portsmouth Barracks, and are kept in stock in large quantities by Messrs. FREEMAN, Millbank-street; also by Messrs. Sharpe, Tooley-street; and at Messrs. Braby's, Belvidere road, where terms may be obtained.

SLATE.—The Bangor Royal Slate Company have now on hand a LARGE ASSORTMENT of ROOFING SLATES, blue and green, of the usual sizes, which they are prepared to supply on the usual terms, for shipment from their depôt, at Bangor, or to transmit by railway. Also Slabs of all sizes.—Orders to be addressed to Mr. EDWARDS, Manager, Royal Slate Quarries, Bangor.

ROOFING SLATES or Covering, Slate Cisterns, Sinks, and every description of Slab work in Slate. Builders will find they are consulting their own interests in forwarding their orders to T. B. HANNAFORD, inasmuch as they not only can rely on first-class materials and workmanship, but that his prices are as low as to be entirely unapproachable.—Trevalga Wharf, Rat-liff cross

ASPHALTE.—GERVASE FOOTTIT TRINIDAD ASPHALTE WORKS, ROTHERHITHE, LONDON. Established 1834.—TRINIDAD, SEYSSEL, and BRITISH ASPHALTES, manufactured by Steam power, laid down in the best manner, or supplied in any quantity. Information for using forwarded with material. Post-office orders or reference in London promptly attended to.—Estimates given for every kind of the above work.

ASPHALTE. — THOMAS HARRISON, having completed his works for making by steam-power, is now in a position to execute orders for BLOCK ASPHALTE to any extent, at an hour's notice. Asphalte expressly prepared for barn and granary floors, and every description of ornamental buildings, for laying which plain instructions will be forwarded. Estimates given for every variety of Asphalte Pavement, Manure and other Tanks, Sea Walls, Railway work, &c.—The Trade supplied on advantageous terms.—THOMAS HARRISON, Asphalte and Whiting Works, Limehouse-heath Wharf, Hackney; and Sunderland Wharf Rotherhithe.

ASPHALTE, FOREIGN and BRITISH, for FLAT ROOFING and every description of PAVING, especially in damp situations.
FROM 2s. 9d. PER SQUARE YARD.
Country Builders supplied with Asphalte for footings and barn floors, with instructions for using it.
Apply to JOHN PILKINGTON, Potsonean and Limmer Asphalte Office, Monument-chambers, 14, Fish-street-hill, London.
N.B. Importer of the PURE ROCK ASPHALTE, from the LIMMER Mines in Hanover.

CROGGON and COMPANY, Manufacturers of
PATENT ASPHALTE ROOFING,
BOILER, RAILWAY, SHEATHING and INODOROUS FELT,
For Damp Walls, and Lining Iron Houses,
2, DOWGATE-HILL LONDON

O. MCARTHY, CARMAN, and SAND and CEMENT MERCHANT, Whitefriars Wharf, Whitefriars, Fleet-street, City. Sand, from above or below bridge, delivered by the yard or per barge. Ballast screened or unscreened, by the yard or per barge. Stocks, lime, and old bricks. Dry rubbish delivered per barge, in any quantity, alongside the Thames.

BUILDING MATERIALS.
BECK'S WHARF, ISLEWORTH.—Builders having works to execute south west of London, will find a good supply upon this wharf, on reasonable terms, with every convenience for speedy loading by travelling cranes, either into barges or carriages. Portland, Caen, Bath, and Yorkshire Block Stone, always in stock; Landings, Paving, &c. Also, Marble in Slab, Chimney-pieces, &c. Slab and Roofing Slates from the Penrhyn Quarries. Timber, Deals, Limes, Cements, Clay Goods, &c.

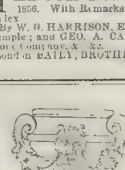
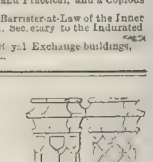
HAND-BOOK of MECHANICS, 357 Illustrations. 5*s.*
HAND-BOOK of HYDROSTATICS, PNEUMATICS and HEAT. 228 Illustrations. 5*s.*
HAND-BOOK of OPTICS. 290 Illustrations. 5*s.*
London: WALTON and MABERLY, Upper Gower-street, and Ivy-lane, Paternoster-row.

1 Vol. Handsomely Bound. 21*s.*
BUILDINGS and MONUMENTS, Modern and Mediæval; being Illustrations of the Entries of the Nineteenth Century, and of some of the Architectural Works of the Middle Ages.
By GEORGE GOLWIN, F.R.S.
Fellow of the Royal Institute of Architects, &c. Editor of "The Builder," and Correspondent of Numerous of several Societies.
With numerous Engravings.
Published at the Office of "The Builder," 1, York-street, Covent-garden.





Third Edition.
THE BUILDER'S FRIEND,
Price One Shilling.
Office of "The Builder," and of all Booksellers.

A COMPANION WORK TO "HINTS ON HOUSE PROPERTY."
In the Press, and will shortly be published, a book that has been long wanted by all parties having dealings in Land,
Price 5*s.* 6*d.*
LANDED PROPERTY: its Sale, Purchase, Improvement, and General Management; containing advice and information respecting the selection and valuation of Houses and Estates; with many valuable suggestions for the instruction of the architect, the country gentleman, the tenant farmer, and the landed proprietor.
By FRANCIS CROSS, Architect and Surveyor, 73, Moorgate-street, City.

TO ADVERTISERS—STATE OF THE CROPS.
THE AGRICULTURAL GAZETTE and GARDENERS' CHRONICLE of this day, AUGUST 16, contains a full report on the state of the Crops throughout the country. Order of any Newsvendor. A single copy sent on receipt of six postage stamps. Office for Advertisements, 5, Upper Wellington-street, Covent-garden.

OUT-OF-DOORS DRAWING
Just published, in post 8vo price 6*d.* cloth,
APHORISMS on DRAWING.
By the Rev. S. C. MALAN, M.A. of Balliol College, Oxford; Vicar of Broadwindsor, Dorset.
London: LONGMAN, BROWN, GREEN, LONGMANS, and ROBERTS.

Just published, price 3*s.* 6*d.* neat in cloth, 3*s.* 6*d.*
THE JOINT-STOCK COMPANIES ACT, 1856. With Remarks Legal and Practical, and a Copious Index.
By W. G. HARRISON, Esq. B.A. Barrister-at-Law of the Inner Temple; and GEO. A. CAPE, Jun. Secretary to the Indurated Stone Company, &c.
London: BAILY, BROTHERS, 4, Royal Exchange buildings, Cornhill.

ORNAMENTAL CHIMNEY-POTS.—More than 100 patterns of the above-mentioned articles are manufactured in artificial stone by J. SEELEY, at Auckland Seeley's Artificial Stone Works, 1 to 4, Keppel-row, New-road. Also, about 200 varieties of Garden Vases.

IMPORTANT TO BUILDERS.

REGISTERED CAST-IRON CHIMNEY-HOPPER and CHIMNEY-BAR COMBINED, ensuring a perfect formation of the Flue, and rendering smoky chimneys impossible. One trial will cause it to be a topic in every building.
Price from 8*s.* 6*d.* each, according to size.
IRON GIRDLERS and COLUMNS to MODEL or DRAWING.
IRON PIPES and connections for gas, water, and liquid manure.
RAIN-WATER PIPES and EAVE GUTTERS, at wholesale prices. Also, O-G Gutters, Sash-weights, STABLE FITTINGS, pumps, bomb rainers, cattle and pig troughs, and COLUMNS with caps and bases, and every kind of builders' castings, in stock, at LYNCH WHITE'S Iron Wharf, Upper Ground-street, London, near Blackfriars-bridge.

The Builder.

Vol. XIV.—No. 706.

THOUGH matters which appeared more immediately pressing have occupied our columns of late, we continue to think that the "Recent History of Architecture"—as not having been directly treated elsewhere—is a subject which it is desirable to pursue,—and considering that it is only by recalling to our minds what has led up to the existing state of art, that we can grasp the circumstances of the present and fix upon the best course for efforts towards the future. Where we last parted with the subject,* it might be seen that a singular combination of influences was at work throughout Europe, leading to the actual condition of architecture,—a condition which has been pronounced unprecedented, and which in our nation is thought to tell discreditably for public taste and the qualifications of our architects. That such opinions are commonly exaggerated indeed, we think also may have appeared,—as also that the circumstances were only such as were likely to supervene on influences anterior to the nineteenth century. It will not do, however, to take shelter from the possible adverse criticism of posterity under any excuses; but we should rather admit that our age, whilst singular in the character of its works, has been singular also in the number of its advantages, and that the error has really been in not knowing how to use an unusual wealth of materials. If we believe that the contemporaneous imitation or adaptation of a great number of opposite styles is not the course best fitted to the growth of *art*, be it recollected that nowhere has such system been so much fostered as in the capital of Bavaria. True, thirty to forty years ago, it might fairly be allowed that more of art was infused into buildings of a particular style and class in Germany, than into corresponding works in England. But, at the same time, if anything could reconcile us to our demerits, it would be found in what could be done by those very men whose reputation stands so high on the continent. Presuming that mere experimentalism—as seen in our own country in the use of several different styles by each architect—constitutes interference with that directness of aim which goes to make productive *power* in art—we shall find that a similar mistake was committed by Schinkel, and even by Klenze. The fame in this country, of both the great Germans, has rested upon their adaptations of Greek architecture,—in which they seem to have preserved all that is valuable in association as to an old style, whilst they developed and enlarged its resources, invented new forms, and infused fresh elements of art and beauty. But, not content to work on this theme—though one sufficiently expansible for a lifetime, and enough for one race of admirers to do justice to—they sought out new fields where they could not be equally successful. Klenze, perhaps, did not adopt his several styles of his own accord. Amongst his works are specimens in the old Greek, new Greek, and Greco-Italian (following one order of classification applied to them), and in the Byzantine, Gothic, and other styles. In all these he has some taste and skill, though not the likewise requisite knowledge of examples. Schinkel also manifested originality, and some taste, in a number of his works, which cannot be referred to any recognized style. But the changes of manner by both these artists, it appears to us, were unfortunate both as to their own powers and the public capability of appreciating. The Gothic of Schinkel is bad beyond the power of description; and Klenze fails in the same style almost as much as his brother artist. It is clear that if the initiative in a design is taken in the manner, or on the basis of an old style, there is always, to some extent, danger that the work will be either deficient in art by the very accuracy of imitation, or it will appear a mere caricature of the old style and proclaim the ignorance of its author. Such danger may, indeed, be inseparable from any active course. But it follows that complete knowledge of the old style *is required*,—on the one hand, even to gain the *art*,—and, on the other, to avoid the caricature. For this knowledge in the case of Gothic architecture, the mediæval buildings of England are the best school; and the continental architects to this day, seem hardly to have perceived the main characteristics of the general style. The mistake in England formerly was similar: it is now of the opposite nature. In short, it must be allowed that the demands upon the *artist*-architect are somewhat conflicting. Novelty is fairly demanded for its own sake; yet novelty alone is not art-work: it is not beneficial to public taste to lead it to an opposite channel: some relationship must there be to old style; yet knowledge of that must be used for the very purpose of *avoiding* the mere semblance of its monuments. From this difficulty then, in a certain class of works, it has resulted that there has been only offensive caricature, or accurate reduplication. Omitting any comparative estimate of the German Greek architecture, it may be asserted that some of its chief works are successful to the extent of our basis of criticism. It may likewise be affirmed, that in works of a similar class of England, ground is being established for similar commendation. We need but name St. George's Hall, at Liverpool, as an obvious instance. In Gothic architecture there has been also progress, though not wholly of the right character. But, on the continent, the progress in the same style seems to us less perceptible in any direction, unless we were called upon to include mere restorations of existing buildings.

However, the development of *art* which above has been more especially referred to, has reached this country somewhat later than it did the continent. We have seen some of the reasons of this. The influence of the Burlington school we believe to have been prejudicial. The greater amount of original *art* in the works of Chambers, Sir Robert Taylor, and even of Soane and Adam, was either limited to them, or it was exceptional in its effects. Henry Holland, and one or two others, had the right feeling; but James Wyatt and his school were but feeble imitators of one style; or such *art* as they could infuse into their Gothic works is unobserved, by reason of the obtrusion of forms, which they would clearly have avoided, with better knowledge of what had previously been done,—whilst also the results of their efforts to grasp too wide a field were unfortunate for the reasons before referred to. In the architecture of England, art had suffered a long *hiatus*; and even yet the whole reasons have not been perceived, which prevent our getting again into the right groove. Till very lately, the number of architects at all qualified for the direction of public works, bore no sort of relation to the demand for such works. The number *now* is in excess of the expressed demand; though it is not in excess of the requirement for good architecture and buildings. Our profession, formerly, had to learn how much the world then required in architecture; the public has now to learn how much of art the profession can and should supply

To realize good architecture at any time, a happy conjunction of elements must contribute to the process of design. The building must group well *en bloc*,—considering tasteful outline, "breadth," and massing of shadow, irrespective of other elements for consideration: it must have beauty and novelty—yet a certain degree of synchronism, elegance, and harmony of all associations in its details: its forms of structure and its forms of art must be in no antagonism with each other; its building materials must have the like harmony from the observance of their distinctive physical properties: the colour and surface must be such as light and shadow, as the chief sources of beauty, will tell upon (and with which light and shadow, shining surface, or depth of colour, may be so much interference): and the value of colour itself must not be left out of consideration. To omit none of such points, and still to keep them before the mind in logical sequence, may not be given to men of ordinary mould or ordinary acquirements. But, for that very reason, no less than on the score of those other *desiderata* in practical architecture which are obvious, should the subject of professional requirements and education no longer be in abeyance. There is error in the present state of taste as there was error before, in the regarding only a section or two of the positive essentials of good architecture. The mistake may not be the same mistake; but it is of fatal character. Some writers, and with reason, are not quite satisfied with the growing tendency which it is thought there is from the use of light towards that of darker-coloured materials,—seemingly passing, without consideration, the mistakes made through the medium of cement, as ordinarily used; whilst others, regarded as influential with the public, hail the appearance of coloured brickwork in street architecture as a thing newly discovered, and as though itself *per se* good architecture.

Some of the imperfections in the architecture of Nash have been already pointed out,—such as his forgetfulness of the unison required between decoration and structure, his erroneous application of cement, and the errors in details which resulted from the defects of his early education. He, however, recognised the value in art, of novelty other than the specious novelty expressed through mere changes of *style*; and he also set some value upon outline and grouping, as in themselves deserving of thought,—points which recently, during the study of details, there has been a tendency to get away from. Mr. Gwilt remarks, that Nash "was beyond doubt a person of great taste," and that had he "been enabled in his youth to have seen the works of Palladio, and to have studied them," he is "confident that the new street he formed would not have been exceeded in beauty by many in Europe." Truly, he adds,—"As far as he understood it, he was a follower of the Venetian school; but his great neglect of detail, and the little care he bestowed upon profiling his orders, arising from the deficiency of his early education as an architect, destroyed the effect of almost all his works. His columns are sometimes outrageous in their proportions, and his cornices rarely much larger than decent-sized copings. He was heedless of propriety in the application of his orders; and, from want of learning in his art, was unable to execute with any certainty the ideas of a very bold imagination." But he also remarks, that in the architecture "of his villas, he was far more successful than in his street architecture."

We apprehend that we might differ from Mr. Gwilt, not as to the value of the works of Palladio, but as to the principle upon which many

* *Vide* vol. xiii. p. 562-7, "Nash and Schinkel: Education of Architects."

of the English architects have approached them,—for it has unfortunately been with certain architects—as it has been sometimes remarked of painters—that they have come back from Italy worse *artists* than they were before. But taking the opinion of Mr. Gwilt as it is, we shall, perhaps, not be considered far wrong in our estimate of Nash. Could we hope that our exertions might have influence on future art, it would be important that our critical view should be even minutely correct. It is allowed that, whatever there may be of merit in particular buildings, and whatever squares and open spaces we may possess, London in effect of *street architecture* is miserably deficient. The first important effort was made in Regent-street; and nothing commensurate with it have we got to, since. There is Victoria-street: it is simply a line of roadway,—debouching, we are not sure, at the right place—considering the original plan, and the position of the great tower of the Houses of Parliament,—and it has nothing whatever, in the course of its length, made conducive, through plan of it and grouping of its buildings, to the street architecture. The merits of the particular buildings are not really part of the immediate question.

Nash, however, did feel the value of the important element in the result—plan. Thus, masses of his buildings combine towards a general effect, though varied from one another; whilst the several blocks carry out the principle of attention to plan. The defects of the architecture are great; and the praise of Regent-street, which at one day appeared in print, was inflated and ridiculous: but we must not allow defects to interfere with any lessons to us from such meritorious characteristics as there are. To show the value of grouping of masses, and of a certain amount of uniformity—without attention to which, what we mean by the effect of general *street architecture* is not gained—it would be sufficient to compare the view along Portland-place with that of Oxford-street. In the former locality, the work of the Adams (who preceded Nash in studying the important points referred to), in spite of the weakness of details, bears with it a particular element of impressiveness,—perhaps not very readily analyzed, but the want of which we painfully feel in Oxford-street; and which cannot be supplied by cement and greater pretension in decoration, details of better character, or even the occurrence of some superior designs. Returning to Regent-street,—the circuses, the crescent at the top of Portland-place, the general grouping of Waterloo-place, and the introduction of the Quadrant, demonstrate at least what no one else has produced,—with the exception of the architect Wood, of Bath, who lived some time previously. There are similar evidences in the grouping of the terraces in the Regent's-park. The Quadrant, according to one story, was the result of accident. It is said that ground on which the County Fire Office stands, intended to form part of the line of street, was obtained by the office unexpectedly, so that the street could not take its origiually designed course. Without knowing the authority for the story, we should doubt it,—because the prolonged line, though better, perhaps, with reference to the Regent's-park, could hardly so well as the present line effect a junction with the foot of Portland-place. But whether the design of the Quadrant was the original one, or made to get over an accident, it is equally deserving of praise. Again, the Church of All Souls', Langham-place, is effective in its plan and its position; and each of these is admirably well adapted to the other. That there are defects in the building is sufficiently obvious; but that design has, perhaps, suffered most from the caricature wherein the architect was represented pierced through by his own spire.

There are fashions in theorising, as there are fashions in dress: one day, an architect is all that is great; shortly afterwards, the element of effect in which he happened not to excel comes into fashion, and straightway nothing good is believed of his works. This is unfair, and is most ill-advised for *art*. In every case the criticism is wrong which estimates on the basis of only one of such ingredients as we have shown must join to form a perfect work of art in architecture. Indiscriminate praise of Nash, or want of perception of such merits as he had,—either of these would mark immature knowledge of first principles. That there are essential constituent parts of good living architecture, without reference to systems of detail and styles, none will question. Yet what some of these are is from time to time forgotten both by architects, and by those who claim to instruct the public: one element is held in favour, to the exclusion of others; and the greater part of what would constitute *art* is disregarded for the pursuit of mere styles. What, however, are the essentials of good architecture should no longer on any side be misunderstood. First principles at least might be made familiar to all. They should be so made if the art is to be estimated, and if it is to advance. And, the duties and requisite qualifications of the architect should be somewhere set forth, so as alike to be called into use, and to be better responded to and supplied than they can be at present; and above all, no further delay should there be in establishing the first step to success—a well-arranged system of professional education. We referred to this latter point some time since, when we endeavoured to show the advantage which Schinkel had in that respect over Nash.—Nash, however, had some valuable personal qualities. He was an excellent "courtier;" or, as one would rather say, a *gentleman;* but there is no necessity to impute to him "sycophancy," to account for his success. Even more than that amenity of manner which some one has said is the best letter of introduction in the world, is required in the constitution of the practical architect. To sink your own opinions formed by study, whenever they are opposed, and appear to take up what you cannot believe, may indeed be neither conscientious nor politic for the common end of art. But to succeed as a practical architect, you must be more than artist or man of science. You must know *men*. True, there are those with whom no assiduity and probity on the part of an architect would protect him from unworthy suspicions, or interference prejudicial to the client's own interest. And there are those calling themselves architects who depend more upon their knowledge of men's weaknesses, than upon technical knowledge and skill. But we say, that, assuming a common aim and mutual forbearance, it will require knowledge of character on the architect's part, to secure the common end, whether through unanimity of opinion or deference to him. No professional man can be expected to give elaborate reasons at every step; but on the other hand, reasoning men will not give confidence till it has been won; and the most able artist and conscientious architect may promote all ends best through knowing what would be the likely current of thought in particular cases, in the mind of his client. The painter, in the mere professional business of his calling, may need such aptitude to less extent. If he possess the fitting artist's qualifications, he produces a painting, and has only to sell. Yet the architect, with corresponding qualifications, may never realize a conception, simply because he lacks the power to put the just view of his own case. Logic, the art of using reason well, is for the architect certainly no less than every other follower of a calling, the first of arts. And the knowledge of how men should, and of how individuals would decide, are closely related to each other. Hence comes the true secret of "unsuccessful great men." But Nash was more than a man of pleasing manners, or good business habits. His success was due in great degree to extraordinary habits of perseverance. This is illustrated by an anecdote. It is said that when very young, he was in a subordinate capacity in Sir Robert Taylor's office,—straining paper, copying letters, and the like. A sudden pressure of work came, and help was wanting. Nash, who had not had any employment previously in drawings, petitioned to be allowed to try his hand. More by way of amusement for his superiors than anything else, as it would seem, he was allowed to try. The result was, that after extraordinary exertions he completed a drawing, in such style that Sir Robert Taylor is said to have remarked,—"That boy will be an eminent man some day;" or, in other words, prognosticated his future success. Good lives of our later architects are much wanted.

During the period of Nash's career several foreign refugees came over, and became connected with him in various ways. Amongst the number was Augustus Pugin, a Protestant, who had no particular knowledge of architecture, but soon began to execute drawings in body colour, married a Miss Welby, took pupils, and was often engaged with his whole staff in assisting Nash. Mr. Ferrey, Mr. Talbot Bury, and Mr. Dollman were amongst Pugin's pupils. Mrs. Pugin was a lady of great energy, and it seems had pretty much the direction of the office. Mr. George Repton, who married one of the daughters of Lord Eldon, was amongst the pupils of Nash.*

Though Nash's style may be regarded as generally belonging to the Palladian school, in its day it was almost an exotic. Bad in detail and in the structural element of *architecture*, unfortunate in the treatment of shop-fronts, and in the manner of use of the lately-invented cement, the profuse employment of which led the late Alfred Bartholomew to call the Regent's-park-terraces "mortar-skimmings by the mile," it was yet not unworthy of commendation for one element in good architecture—scenic effect. But whilst with that object in view, the architectural efforts of our country at the time were not undeserving of notice, it could scarcely be otherwise than that they should be inferior to the works of the continent. To produce great works, commanding abilities are required in the artists; and we have seen how the Germans were ever educating themselves for the demands upon them which were to arise. No similar course had been pursued, or none to the like extent, by the English architects, or even could be. But there is a further contrast afforded. Architects cannot work till employment is given to them; and on the *manner* in which what is called "patronage" is exercised, as much as upon the labour of artists, the great works of a country depend.

THE MANUFACTURE OF BRICKS BY MACHINERY.†

The manufacture of bricks is a subject embracing so great a diversity of treatment, from local circumstances, the varying chemical quality of the earths or clays, and the great number of improvements lately introduced, as well as from the multifarious processes under which the manufacture is carried on, that I am obliged to abandon describing the principle best suited to each particular class of earth, and merely to give a general idea of the manufacture and the mechanical contrivances invented for its improvement; nor will the limits of this paper allow of more.

The process of brickmaking is one of the most ancient manufactures in the world. We are told in Scripture that the tower of Babel was built with well-burnt bricks; that the walls of Babylon were of a similar construction; and that the Israelites, during their oppression by the Egyptians, were employed in brickmaking. The ancient Romans were brick and tile makers: excellent specimens of their manufacture still remain. In England, bricks were not generally used until the middle of the fifteenth century. The Lollard's Tower, Lambeth Palace, built in 1454, is about the most ancient brickwork in London. The old part of Hampton Court was built in 1514.

I have given this glance at the antiquity of the process to show that, although so ancient, it has received scarcely any improvement from the aid of machinery until within the last few years.

* A well-informed correspondent, who wrote us with reference to our previous notice of Na-h, says, "After leaving Sir Robert Taylor's, where he was at the same time with Mr. Cockerell, he practised in London as a measurer and a speculative builder. Then he retired to a property at Carmarthen, and associated with all the best men in the county, and at last took to architecture on a sudden impulse, instigated by a visit from Mr. Cockerell, who went down to Carmarthen in a chaise-and-four, while Mr. Nash was comparatively a poor man, for he had taken all the woods of Tallharries, in conjunction with one named Saxon, and, perhaps, lost money. He had a private theatre, among other things, and old Charles Matthews was one of his private company. His two first works were St. David's Cathedral, and a lodge (or some little thing), for Mr. Johns, of Hafod, a very intimate friend, and then he rapidly got business when it was known that he had resumed his profession. He never was a miniature painter, and I never even heard such a story before. He had the elder Pugin and Foul-n, and Morgan, of the Regent's Canal (still alive), as his first clerks."

† Read by Mr. Humphrey Chamberlain, Draining Engineer, at the Society of Arts.

At the present time bricks are manufactured in the most primitive way. Those made by hand are generally of very inferior quality to machine-made ones. The numerous titles of the London bricks best illustrate the state of this manufacture. There are wash bricks, grey stocks, rough stocks, paviours, pickings, grizzles, place, shuffs, and numerous other titles. Now, there should be but one quality, if the process was carried out with good machinery, in a suitable manufactory, and those all best bricks. A very few experiments will prove a clay, as to what preparation or mixture of other earths it requires, and the temperature at which it burns to the best colour and soundest article. From the London makers so strictly adhering to the old system of handmaking and clamp burning, they have opened a market for makers by machinery over the country, who, from the superiority of their ware, command such a price that they can now afford to send bricks by railway, 80 and 100 miles, to the metropolis.

One great check to improvement, both here and at Manchester, is the existence of clubs amongst the men, but these must give way as other districts advance.

The importance of the brick trade is illustrated by the following:—

The quantity of bricks made per annum in this kingdom is about 1,800,000,000. Of this quantity Manchester alone makes about 130,000,000 per annum. What are termed the London makers produce about the same quantity, but bricks are sent to the metropolis from a circuit of 100 miles: it is, therefore, impossible to give exactly the consumption. Taking bricks at the low average of three tons per 1,000, the annual make exceeds in weight 5,400,000 tons, and the capital employed must be upwards of 2,000,000*l.* sterling.

Before entering on the manufacture by machinery, I will briefly describe the present process of making by hand, as practised in the neighbourhood of London.

The clay is dug in the winter, and spread over a large surface of ground, to expose it as much as possible to weather, more particularly to frost, to act on the compact tough mass, and so divide it into as small particles as possible, that during the summer or making season, labour may be saved in working in that quantity of water which is necessary to bring it into a ductile mass. This clay is thrown out in layers, over which are spread coal-ashes, or what is termed breeze, which perform several functions. First, they make the clay of a more porous and open character, which is attained by using sand in the country; secondly, they prevent the clay shrinking too much, and the sun and the wind cracking the bricks when drying; and thirdly, they are useful in the firing of the ware, by assisting to burn the bricks. Chalk is also added, for the sake of colour, and acts as a flux on the silica of the clay in burning. This is tempered by hand into an even mass of soft clay or mud, which is effected by turning it over several times with wooden spades, and at each turn working in as much water as possible. This operation is not considered complete until all the clay has absorbed an equal quantity of water, and becomes a thick plastic mud: to effect this pug-mills are also used, and chalk-mills, but the latter is more for the sake of colour, and is only a local practice. This clay is made into bricks by an artisan called the moulder, who is supplied by an attendant lad with a lump of the material, rather more than sufficient to fill a small box, in shape a parallel-opipedon, called a mould, containing about 150 cubic inches, in some parts of the country nearly 200 cubic inches, varying a little in size in most districts. The art of the brickmaker, or moulder, is the knack with which he throws, or drops, this soft clay into the mould, so as to fill up every corner. This is apparently a very simple process, and is the one to which I shall have to draw your attention this evening, and the accomplishing of which by machinery has caused a vast expenditure of time and money, and occupied the attention of many leading mechanics for some years. These moulds are emptied by being turned over on a board called a pallet-board. The material used being soft clay, and the mould kept constantly wet by dipping in water between each charge (which is called slop-moulding), or sprinkled with sand or dust, the brick easily drops from the mould on its being held over the pallet-board. The bricks, when moulded, are carried or wheeled away to the hacks, or drying-floors, where they are placed edgeways, about half an inch apart, or the thickness of the pallet-board, one row on another until they form a wall six or eight bricks high: they are then covered up and left to dry, ready for the burning. This latter process we shall discuss in a succeeding paper.

The number of patents taken out, connected with the manufacture of bricks, has been obligingly supplied to me by Mr. Carpmael: they exceed 230. It would be impossible to describe each particular machine, and I, therefore, propose to illustrate, as clearly as I can, the several principles which have been attempted by these inventors, and with what success. I shall not occupy you by references to the earliest inventions, as we know they were not successful, or they would be worked at the present day; but will notice those principles now before the public.

Before commencing with the manufacture of the brick, we must prepare the raw material,—clay.

There are few places on almost the whole of the geological strata of this country, which do not possess alumina in combination with silica and other earthy matters forming a clay from which bricks can be manufactured. That most generally worked is found on or near the surface in a plastic state. Others are hard marls on the coal measures, new red sandstone, and blue lias formations. It is from these marls that the blue bricks of Staffordshire and the fire bricks of Stourbridge are made. Marl has a greater resemblance to stone and rock, and varies much in colour,—blue, red, yellow, &c. From the greatly different and varying character of the raw material, there is an equal difference in the principle of preparation for making it into brick; while one merely requires to be turned over by hand, and to have sufficient water worked in to make it subservient to manual labour, the fire-clays and marls must be ground down to dust, and worked by powerful machinery before they can be brought into even a plastic state. Now these various clays also shrink in drying and burning from 1 to 15 per cent. or more. This contraction varies in proportion to the excess of alumina over silica, but by adding sand, loam, or chalk, or (as is done by the London brick-makers) by using ashes or breeze, this can be corrected.* All clays burning red contain oxides of iron, and those having from 8 to 10 per cent. burn of a blue, or almost black colour. These bricks are exposed in the kilns to great heat, and when the body is a fire-clay, the iron melting at a lower temperature than is sufficient to destroy the bricks, gives the outer surface of them a complete metallic coating. These bricks are common in Staffordshire, and when made with good machinery (that is, the clay being very finely ground), are superior to any in the kingdom, particularly for docks, canal or river locks, railway bridges, and viaducts. Other clays contain lime and no iron: these burn white, and take less heat than any other to burn hard enough for the use of the builder, the lime acting as a flux on the silica. Many clays contain iron and lime, but where the lime is in excess, the bricks are of a light dun colour, or white, in proportion to the quantity of that earth present; if magnesia, they have a brown colour. When iron is in excess, they burn from a pale red to the colour of cast-iron, in proportion to the quantity of metal, as I before explained.

There are three classes of brick earths:—

1st. Plastic clay, composed of alumina and silica, in different proportions, and containing a small per centage of other salts, as of iron, lime, soda, and magnesia.

2nd. Loams, or sandy clays.

3rd. Marls, of which there are also three kinds; clayey, sandy, and calcareous, according to the proportions of the earths of which they are composed, viz. alumina, silica, and lime.

Alumina is the oxide of the metal aluminium, and it is this substance which gives tenacity or plasticity to the clay, having a strong affinity for water. It is owing to excess of alumina that many clays contract too much in drying, and often crack on exposure to wind or sun. By the addition of sand this clay would make a better article than we often see produced from it. Clays contain magnesia and other earthy matters, but these vary with the stratum or rock from which they are composed. It would be impossible to give the composition of these earths correctly, for none are exactly similar; but the following will give an idea of the proportions of the ingredients of a good brick earth;—silica three-fifths, alumina one-fifth, iron, lime, magnesia, manganese, soda, and potash forming the other one-fifth.

The clay, when first raised from the mine or bed, is, in very rare instances, in a state to allow of its being at once tempered and moulded. The material from which fire-bricks are manufactured has the appearance of ironstone and blue lias limestone, and some of it is remarkably hard, so that in this and many other instances which I shall have to notice, in order to manufacture a good article, it is necessary to grind this material down into as fine particles as possible.

Large quantities of bricks are made from the surface marls of the new red sandstone and blue lias formations. These also require thorough grinding, but from their softer nature it can be effected by less powerful machinery.

The principal machines which have been worked for this purpose are three—1st. The pug-mill. 2nd. The wash-mill. 3rd. The rolling-mill.

The pug-mill is a cylinder, sometimes conical, generally worked in a vertical position, with the large end up. Down the centre of this is a strong revolving vertical shaft, on which are hung horizontal knives, inclined at such an angle as to form portions of a screw, that is, the knives follow each other at an angle forming a series of coils round this shaft. The bottom knives are larger, and vary in form, to throw off the clay,—in some mills vertically, in others horizontally. Some have on the bottom of the shaft one coil of a screw, which throws the clay off more powerfully where it is wished to give pressure.

The action of this mill is to cut the clay with the knives during their revolution, and so work and mix it that on its escape it may be one homogeneous mass, without any lumps of hard untempered clay; the clay being thoroughly amalgamated, and in the toughest state in which it can be got by tempering. This mill is an excellent contrivance for the purpose of working the clay, in combination with the rollers, which I shall describe presently; but if only one mill is worked, I should not adopt it generally, for, although it tempers, mixes, and toughens, it does not extract stones, crush up hard substances, or free it from all matter injurious to the quality of the ware when ready for market. This mill can be worked by either steam, water, or horse-power; but it takes much power in proportion to the quantity of work which it performs. If a brick is made with clay that has passed the pug-mill, and contains stones, or marls not acted on by weather, or lime-shells (a material very common in clays), or any other extraneous matter injurious to the brick, it is apparent from the action of this mill that it is not removed or reduced. The result is this, the bricks being when moulded in a very soft state of tempered material, or mud, considerably contract in drying, but the stones or hard substances not contracting cause the clay to crack; and even if they should not be sufficiently large to do this in drying, during the firing of the bricks there is a still further contraction of the clay, and an expansion of the stone from the heat to which it is subjected, and the result is generally a faulty or broken brick, and on being drawn from the kilns the bricks are found to be of inferior quality, commonly termed addled—that is, having no ring or metallic sound when struck—liable to great waste from breakage in carriage and otherwise deteriorating the ware. In the case of lime, on exposure to the atmosphere these shells, from absorbing moisture, lax or swell, forming lime powder, and in so doing burst the brick to pieces.

* Before commencing to work a bed of clay, in the first place it is necessary to ascertain its contraction in drying and burning; secondly, how this can be corrected at the least expense if in excess. The necessary proportion of sand, lime, or chalk, would so vary with the clays, that no rule could be laid down, and it must be left to actual style.

Next is the wash-mill; but this I must merely glance at, as it cannot be practically worked for the manufacture of common bricks on a large scale, but only for front bricks. By a general adoption of good brick machinery, and a more general knowledge of the preparations of clays, we should have all our bricks equal in quality to what are now termed front bricks. This mill is a large circular trough, round which is a horse-walk. The clay is worked in this trough with water by harrows, drawn by one or two horses, until it is all thoroughly mixed up into a fluid state. It is then let off into a pit at a lower level through a grating, or a series of gratings, which extract all stones and coarse undivided particles. In proportion to the fineness of these gratings or sieves, so is the quality of the clay. It is there left to subside; the water is then let off from the top, and the clay, when sufficiently stiff, is thrown out for work. By this means clay can be prepared of the finest quality. This is the principle on which china and earthenware clays are prepared after grinding. The expense would prevent its becoming general with brickmakers; and in the case of fire-clays, marls, or any such earths as produce our best materials, it would be useless until they were ground down. It also consumes a large quantity of water, which could not be had in sufficient abundance in many districts.*

MECHANICS APPLIED TO PURPOSES OF WAR.

If dread war is to continue a stern necessity, civilised man must make it, as much as possible, mechanical. Huge ships of war are propelled by steam and screw: gun-boats, by aid of the same potent power, will "glide wherever it is a little damp;" and there is no reason why in our next war an army shall not have its field machinery as well as its field artillery. Portable steam-engines may be made to do the work necessary in war, as effectively as they now aid in all the requirements of peace. This has been proved by Sir S. M. Peto; as, amidst the thunder of artillery at Sebastopol, might be heard the panting of the steam-engine, the clanking of the forge, and the whizzing of the circular-saw. It is to this use we wish to direct attention now in time of peace, that experiment and training may perfect machines, and allow time to learn their full use. Portable steam-engines may grind, bore, saw, pump, and in many other ways aid the sapper and artizan soldier. We take it for granted, the army works corps of Sir Joseph Paxton will be matured into a permanent military body. There is a prejudice amongst military men against new appliances of a civil character. Even after the terrible winter in the Crimea, the best joke (in their opinion) certain staff officers made was, that the railway had carried all it was made to carry, and all it was fit for, namely, a baronetcy to Sir S. M. Peto. It would have been as well if some of these gentlemen had as honestly earned their honours.

The steam-boat workshop, steam-boat bakery, the railway, and the army works corps, nicknamed "the army drudges corps," did good service, and it is to be hoped sneers from ignorant officials will not retard the use of machinery, but that all possible means will be taken to make steam do the work of flesh and blood. Steam aids in manufactures, in agriculture, in navigation, in naval war, and may be made to aid in field war.

If all our ships of war having steam-power on board have (to a limited extent) circular-saws, planing-machines, mortising machines, &c. to be used in time of need, neither vessel nor crew will be less efficient for actual war. If portable steam-engines go out with the sappers, they need not be more difficult to carry along than field artillery. Timber for huts, for gun-platforms, for temporary bridges, for stockades, and for all other the purposes of war, may then be cut and converted in an enemy's country. The Black Sea is bordered by as fine timber as any in Europe or Asia: the Black Sea fleet lay months idle, with an immense steam-power idle also: will it be considered treason, if we hint that some of this timber might have been cut, and might, by the dormant steam-power, have been converted to use for the siege? Let us prepare ourselves to do better next time.

* To be continued.

MIDDLESEX INDUSTRIAL SCHOOLS COMPETITION.

Your statement in the *Builder* of the 2nd instant, with reference to the plans sent to the committee of magistrates, is perfectly correct. Out of forty-one plans, the professional referees selected seven as being the best, or rather the least bad; and of those seven one received the lowest premium.

The plain truth is, that the competition greatly disappointed the magistrates, and unless I am much mistaken the referees were astounded at the worse than mediocrity displayed by the competitors. As you state, even those they selected were all open to objection in their professional view, while in a practical point of view they were deplorably defective.

The main results sought for in such a design are thorough ventilation and good light, facilities for supervision, and easy communication from all parts to central offices and workshops, preserving complete separation for sections of the inmates, according to the paper of instructions. I do not profess to have much skill in architectural elevations, but a large number of the plans presented very curious resemblances to old plans of prisons and workhouses, with new faces of the florid Cockney school, pastry-cooks' Gothic, and Elizabethan beershop style. There were a few which displayed some little confidence in the simplicity of a large mass of buildings; but the accompanying details were wanting in nearly all that was requisite.

Now, what is a committee to do? I feel confident that no committee ever deserved success more than ourselves. We offered liberal premiums, sought professional aid to assist our judgment, and the result is an utter failure. If we had confided the commission to any one architect, there would have been a yell from the profession against a flagrant and scandalous job. Eminent architects will not compete; but in the discharge of a public trust we felt we should best satisfy public or professional jealousy by an open competition.

I have come to the conclusion that the proverb, as to the intellectual condition of those persons who "build," as contrasted with those who "buy," is quite as much at the service of the profession as of the public.

P. Northall Laurie.

*** The present position of the affair is shown by the following determinations of the committee on the 21st and 28th of July.

"21*st July*, 1856.—The committee having heard the explanations of the three architects to whom the premiums have been awarded, in regard to the objections made to the respective plans, are not at present prepared to recommend any one of the three, and they therefore will entertain and consider any other plan that may be brought before them by any individual member of the committee."

"28*th July*, 1856.—Resolved, that this committee do now adjourn to Monday, 4th October next, and that any further plans which any member of the committee may wish to propose in pursuance of the resolution of the 21st inst. be sent to the Sessions House, Clerkenwell, on or before Monday, the 25th August next."

We are curious to learn on what grounds the committee justify their disregard of the recommendation of the professional referees. Are we to suppose that the committee are better judges than the architects to whom they referred the selection? They passed over designs selected by their own referees, and rewarded designs which they find they cannot recommend for adoption. The proceeding is certainly most irregular. As to the demerits of the designs submitted, or the justice of the referees' selection, we can say nothing of ourselves, no opportunity having been afforded us to see the drawings.

Manchester Mechanics' Institution.—The new building, erected and just completed for the Manchester Mechanics' Institution, is to be opened on the 19th proximo, with an exhibition including statuary, pictures, various fine art manufactures, and a collection of machinery in motion.

CHURCH-BUILDING NEWS.

Grantham.—The cemetery buildings are progressing. Mr. Wilson is the builder. The new road and bridges are also in a state of forwardness. The line of road has been altered for the second time at the curve. The last alteration, we understand, is made for the accommodation of the proposed road to the militia barracks or storehouses.

Braintree.—The contractor for the restoration works at Braintree Church, Mr. Parmenter, has commenced building the scaffolding preparatory to the repairs of the tower and spire, the portion of the proposed works which the committee have resolved shall be first executed.

Tunbridge.—The Local Burial Board, on considering the designs sent in for the chapel to be erected in the new cemetery, decided on adopting that furnished by Mr. Messenger, of Folkestone, architect.

Burwash.—The Burwash parish church, which has been restored, and adapted for the accommodation of the inhabitants, was reopened on 30th ult. for divine service. The chancel has been entirely rebuilt on the old foundation, and the details of the windows have been copied from the originals. In most cases the old stones have been re-worked. The roof is panelled, and the original pitch has been adhered to. The chancel-arch has been repaired. The aisles have been rebuilt and widened,—the windows and doors copied from the originals. The nave and aisle roofs, which form one continuous line, have also been restored. The tower, which forms the most ancient portion of the church, being of very early Norman, if not Saxon, architecture, has also been restored. Before the alterations there were doors and a modern staircase leading to the belfry, but the tower arch has now been thrown into the church, and a ringing-floor above provided, and an external turret-staircase on the south side, entered from the churchyard. There is a porch at the western end of the tower of the same date as that of the north arcade, viz. about 1360, and which has been entirely rebuilt, the same details as that of the original being followed. The restoration has been undertaken by the Rev. J. Gould, the rector, assisted by a rate and subscriptions. The east window, executed by Mr. Ward, of London, from the cartoon of Mr. Clayton, is the result of a special contribution for that purpose. The churchwardens, Messrs. Telly and Hyland, says the *Surrey Standard*, intend filling the two windows in the west end of the tower with stained glass. The works have been carried out from the designs and superintendence of Mr. William Slater, of London, architect, as successor to the late Mr. Carpenter, who had made a survey and plan of the church. The works were executed by Mr. Pannett, builder, Tunbridge. The whole expense of the restoration will be about 3,000*l.*

Winchester.—Lords Redesdale, Saye and Sele, and Tenterden, the Speaker of the House of Commons, Mr. Justice Erle, Sir William Heathcote, Bart. and various other M.P.s and other gentlemen have formed themselves into a committee for raising a subscription amongst Wykehamists for the purpose of erecting, near the chantry of William of Wykeham, in Winchester Cathedral, a memorial window and tablet in honour of those of their brother Wykehamists who died on the field, or from sickness, during the late war.

Warwick.—A new church has been opened in the parish of St. Nicholas, Warwick. The church, dedicated to All Saints, stands on a site presented by the Earl of Warwick. It is in the Decorated style, and consists of nave, south aisle, chancel, south chancel aisle, and north and south transepts. There is a vestry on the north side of the chancel. On the west side of south transept is the tower, containing the principal entrance to the interior, and intended to be hereafter surmounted by a spire. The interior, calculated to afford accommodation for 580 persons, is fitted with open benches, and the chancel with stalls. Two-thirds of the sittings are free. The walls are constructed of brick, with blue lias stone facing and moulded work. The tracery and other dressings, internal and external, are of Bath stone. The roofs are constructed of open framing of Memel timber,

stained and varnished, and are covered externally with tiles. The architect was Mr. James Murray, of Coventry. The contract for the whole was 3,100*l.*

West Littleton.—The church of West Littleton, which, says the *Bristol Mirror*, is the third in the same parish that has been restored and enlarged within the last three years and a half, was re-opened on 31st ult. The works connected with it have been carried on, as were those of Tormarton and Acton Turville, by Mr. Miller, of Seagry, under the direction of Mr. T. H. Wyatt, of London, architect. The only part remaining of the original edifice are the walls of the chancel: all the rest, including the bell-turret, it was found necessary to reconstruct. A new and larger nave and porch and vestry-room have been built. The whole of the interior has been re-arranged and made capable of containing more than double the former number of worshippers. A new font, of Tormarton-stone, has been erected. The stained glass window at the east end is the work of Mr. Miller.

Wrexham.—The laying of the foundation-stone of St. Mark's Church, Wrexham, took place on Monday before last. The church, which is partly built, having been begun two months ago, is situate in the Hope-road, not far distant from the new Roman Catholic chapel, now in course of erection. The ground was given by Sir W. W. Wynn (who also subscribed towards the erection), and measures 100 yards by 50 yards. There will be 800 sittings, and a tower and spire. The church will be in the Early Decorated style (from the designs of Mr. Kyrke Penson, of Swansea), and will consist of a nave, two aisles, two transepts, a chancel, and vestry, with a bell-turret adjoining the vestry. The extreme length will be 132 feet, and the width of the nave and aisles 57 feet. The roof of the nave will be 68 feet, that of the transepts 56 feet high: the roof will be an open timber one. The sittings will consist of open stalls, and at present it is not proposed to have galleries. At the south-west corner of the building it is intended to erect the tower and spire, 168 feet high.

Nantwich.—For some time past the ancient parish church of Nantwich has been undergoing the process of restoration by Mr. Scott. The projected, and now only partially completed, restoration is on a large scale, 8,000*l.* being the architect's total estimate for what was required to be done. Towards this sum about 4,000*l.* have been raised, and applied to the thorough renovation of the nave of the church. The transepts will next occupy Mr. Scott's attention, and subsequently the chancel and other subordinate points.

Capenhurst.—The first stone of Capenhurst Church was laid on Wednesday before last, by the Rev. R. Richardson, of Capenhurst Hall. The building is to be erected at his own expense, for the accommodation of his tenantry and those of the adjoining township of Ledsham. He is also to endow the church. The church is in the Decorated style of architecture, designed by Mr. Harrison, of Chester, architect, and it is to accommodate 200 persons. Mr. J. D. Williams, of Chester, is the builder.

Manchester.—A new window, from designs by Mr. Speakman, architect, has just been inserted in the tower of St. Paul's, Higher Broughton. It has three lights, with tracery of the Early Perpendicular period. It has been filled with stained glass by Messrs. Edmundson and Son, of this city, who have been commissioned to supply a similar window for the north transept of the same church.

Maryport. — Crosscanonby Cemetery, near Maryport, was consecrated on Wednesday before last, by the Bishop of Carlisle. The ground is situated about 1¾ mile from Maryport, on the Netherhall road, in view of the sea. The soil is gravelly. It is enclosed by a red stone wall, which, on the west side of the ground, will be surmounted with a palisade. The cemetery is still in a rough state. The entrance is by an archway, on either side of which a curator's lodge, and a board-room and office, are in course of erection. On the opposite side of the ground are two chapels, one for the Church of England, and the other for Nonconformists. They are both of red stone, and in the Norman style. Each will accommodate about 100 persons. Both chapels have porched entrances, supported by three arches. The interiors are fitted up with stained wood, and are lighted by small windows of cathedral glass. At one end is an apse, or rounded projection, which in the Church of England chapel answers for the purposes of a chancel, and in the Nonconformist chapel contains the reading-desk. Each chapel is also provided with bell-turrets, in which it is intended to hang bells. They are both flagged, with the exception of the apses, which are paved with Minton's tesselated pavement. The whole has been designed by Mr. Charles Eaglesfield, of Maryport, architect, who is also about to lay out the ground. The contractors for the work were Messrs. Fraser and Brotherton, of Workington.

AN ATTEMPT TO ACCOUNT FOR THE MOON'S ROTATION.

Observing that you have recently extended your already world-wide influence, and have gone so far as to treat of the architecture of the moon, perhaps you will be induced to find space for the lucubrations of a brother architect, the mundane character of whose thoughts have been disturbed by the recent controversy on the motions of the noctural luminary.

I am not deeply read in the objections of Mr. Jelinger Symons, yet I cannot but think that the defenders of the received theory have been somewhat too positive, and, in some instances, a little superficial in their replies.

Nothing can be more obvious than that the moon's motion involves, *by implication* (if I may use the expression), a rotation upon her axis as well as a motion in an orbit; that is to say, that had she received, when launched into space, these two impulses, precisely agreeing in their periods, the result would be just what we now observe. It is equally obvious, that had she then received only a single impulse (that in her orbit), and no other cause or force interfered with the motion thus communicated, her motion would *not* have been what it now is. This the simplest experiment or the mere consideration of the laws of motion would suffice to prove.

It does not, however, follow that because a motion may be shown to be resolveable into two or more others, it is therefore actually *the result* of such motions. It may be that it is also resolveable into some quite different motions; and we should then have to choose to which we should actually attribute the result. Any ball on the earth's surface (or at least on the equator) has every twenty-four hours a motion precisely like that of the moon, and may, on the same principle, be said to rotate on its axis; but put such a ball into a hollow sphere (as, for instance, an orange into a glass globe) and the same argument will prove it not only to rotate upon its own axis, but, as it is now become a portion of the larger sphere, it will, on the same principle, rotate upon *its* axis, or on those of any number of spheres in which you may imagine it to be enclosed. In the same manner the moon may be proved to rotate upon an *infinite number of axes*,—indeed, upon any line at right angles with the plane of her orbit, provided only that that line be supposed to accompany her in her motion round the earth: and, though her own axis is the most likely one for her to choose, it is clearly somewhat arbitrary to assert, *as self-evident from the nature of her motion*, that she actually does rotate upon it.

The question, however, of most interest, is, what is the actual cause or origin of her peculiar motion? As in the rotation of the primary planets we are able to perceive an object of the very highest importance, it is natural to conclude that it was a part of the original impulse communicated to them by their Creator; but we find no exact proportion between the periods of their rotation and of their orbit, much less a precise coincidence between them. This coincidence, however, so utterly without analogy in the motions of the primary planets, seems to be the constant rule among the secondary planets or satellites, which all appear to move round their primaries, turning to them from age to age one and the same face; or, in other words, to have just the same motion round them as a ball whirled round at the end of a string.

Surely, then, this exactness of coincidence between their rotation (if it be really such) and their motion of revolution, so unlike anything else observed among celestial bodies, and, as far as we are capable of judging, unconnected with any purpose founded on utility, must be the result of some mechanical necessity common to all the satellites. My object in troubling you is, though not without some hesitation, to suggest such a cause.

Imagine the moon when first launched into space to have had but one motion—that in her orbit. She would then *apparently* have had a rotatory motion, as she would not, as now, keep one face steadily towards the earth, but would in turn present every part of her surface. Imagine her, again, to have been, as our own earth appears once to have been, and as the appearance of the moon's surface seems still more strongly to suggest, either wholly or to a considerable depth, in a *state of fusion*. The gravitation of the earth would produce on this liquid mass a tidal wave. The diameter directed towards the earth would be elongated, and as she moved in her orbit the elongated diameter would be constantly changing, producing on either side a fiery wave always following the earth, as the watery wave on our globe ever follows the moon. This wave, from the sluggishness of the matter composing it, would linger behind as our tidal wave now lingers behind the moon; and it strikes me that the attraction of the earth, ever striving to draw forward the sluggish wave to its proper place, would tend in the course of time to generate a quasi-rotatory motion in the moon herself; at first very minute, but increasing till it superseded the necessity for motion in the tidal wave, and caused the elongated diameter to be stationary, and constantly pointing towards the earth; in which position it would continue, as we now find it to exist, when at length the molten surface became solid.

Let it not be supposed that I am claiming any very enormous result for the cause I have imagined. The rotatory motion of the moon (if it be properly so called) is but a slow one after all; for while the earth at its equator moves, in its diurnal circuit, at the rate of 1,000 miles an hour, the moon's equator does not go faster than a respectable stage-coach.

If this explanation be correct, the moon's motion may or may not be said to involve a proper rotation, but, to say the least, it is a rotation of a very different kind and a very different origin from that of the primary planets. S.

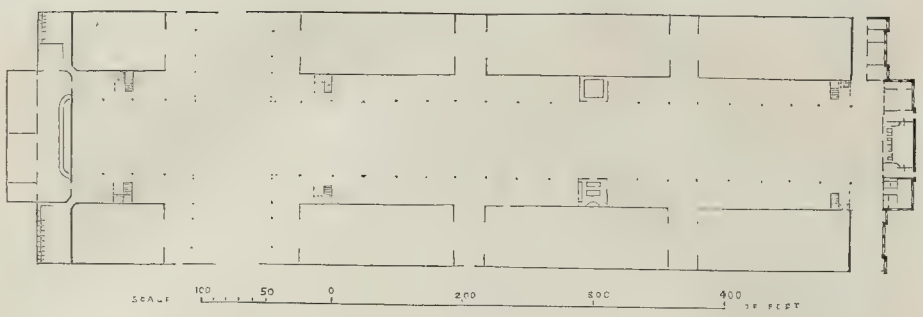
DEPARTMENT OF SCIENCE AND ART.

The third report of the United Department has been published. Under the head of Geological Surveys, it shows that in Great Britain during the past year, the total field-work extends over nearly 1,700 square miles. "One sheet and fifteen quarter sheets of the trigonometrical survey, geologically coloured, have been published since the last report. These embrace an area of about 2,400 square miles, and comprise parts of the counties of Worcester, Salop, Chester, Stafford, Leicester, Nottingham, and Derby."

In the training school seventy-nine masters, in training, have attended during the last year. At the sale of the Bernal collection, 730 lots were purchased for Marlborough House. The average price amounted to 11*l.* 7s. per lot, while the average price of the entire number of lots (4,294), was 14*l.* 11s. Reference is made to the establishment of what have been called trade schools. "The object of these schools is to impart to the sons of tradesmen, artizans, workmen, and others a knowledge of those principles of science and art on which *all* trades and manufactures are founded, and to give a thorough insight into the elements of those things with which they will constantly have to deal in after-life. They do not, however, propose to have particular trades taught, or to interfere between the master and the apprentice."

The first school of this kind was organised at Wandsworth, and we find under the head "Building Trades," the following course of instruction set down:—

"1. *Builder's Drawing.*—Or, the drawing to a scale, plans, elevations, and sections of buildings.



2. *Builder's Arithmetic.*—Or, the principles of making estimates for the cost of constructions and contracts.

3. *Builder's Geometry.*—Or, the measurement of the sites, the levels, the workmanship, and the materials of buildings.

4. *Builder's Mechanics.* — Or, the principles of the stability of structures, the selection, strength, and economy of materials.

5. *Builder's Natural Philosophy.* — Or, the principles of ventilation, sewerage, and heat and light, as applied to buildings."

A list of subjects for design is given, including paperhangings, pottery, and wall decoration, for which both money and medals will be awarded.

Plan of the Manchester Exhibition Building.

THE MANCHESTER EXHIBITION BUILDING.

The works for the building at Trafford, for the exhibition of "Art-Treasures," are now being proceeded with in earnest. The first pillar has, we believe, been raised, and we now lay before our readers a plan of the building and a view, showing the appearance the interior will take. The plan of the building, it may be seen, will be rectangular, 656 feet long and 200 feet broad, exclusive of a 24 feet projection at both east and west ends, which will give a total length of 704 feet. It will be divided longitudinally into a central hall, 104 feet wide, and two side halls or galleries, each 48 feet wide. The offices, refreshment-rooms, and other conveniences, will be arranged at the end, as shown upon the plan.

The second-class refreshment-rooms and offices are not shown upon the plan, as their disposition depends upon the arrangements to be made in connection with the railway accommodation.

The front will be constructed of white fire bricks, and decorated with red bricks. The railway corridor will meet the façade, and the design of this corridor will be in harmony with the front. There will be therefore a total frontage of about 600 feet. The sides of the building, which will be made of corrugated iron, will be supported by uprights of cast-iron, 8 feet apart, the corrugations running horizontally: the principals supporting the roof of the side galleries will be 12 feet apart, covered with corrugated sheets, excepting a portion of the centre, which will be of glass. The centre hall, 104 feet wide, will be divided by columns 24 feet from the sides, bearing 56 feet in the centre, which will be covered by a semicircular roof, also covered with corrugated sheets, and lighted in the centre. The whole of the roofs and walls will be lined with boarding, which will be covered with canvass and paper designed for the purpose. Galleries will extend round the west end of the building and transept, and there will be a smaller one at the east end of the building. Mr. E. Salomons is the architect; Messrs. C. D. Young and Co. the engineers and contractors.

As regards the kernel of which this is to be the shell, the prospects are said to be very satisfactory. To this, however, we shall have other opportunities of referring. Mr. John Deane is the general commissioner, and Mr. Minchin is the secretary.

The catalogue, which will be *raisonné*, is to be edited by Mr. Peter Cunningham.

THE PENNETHORNE TESTIMONIAL.

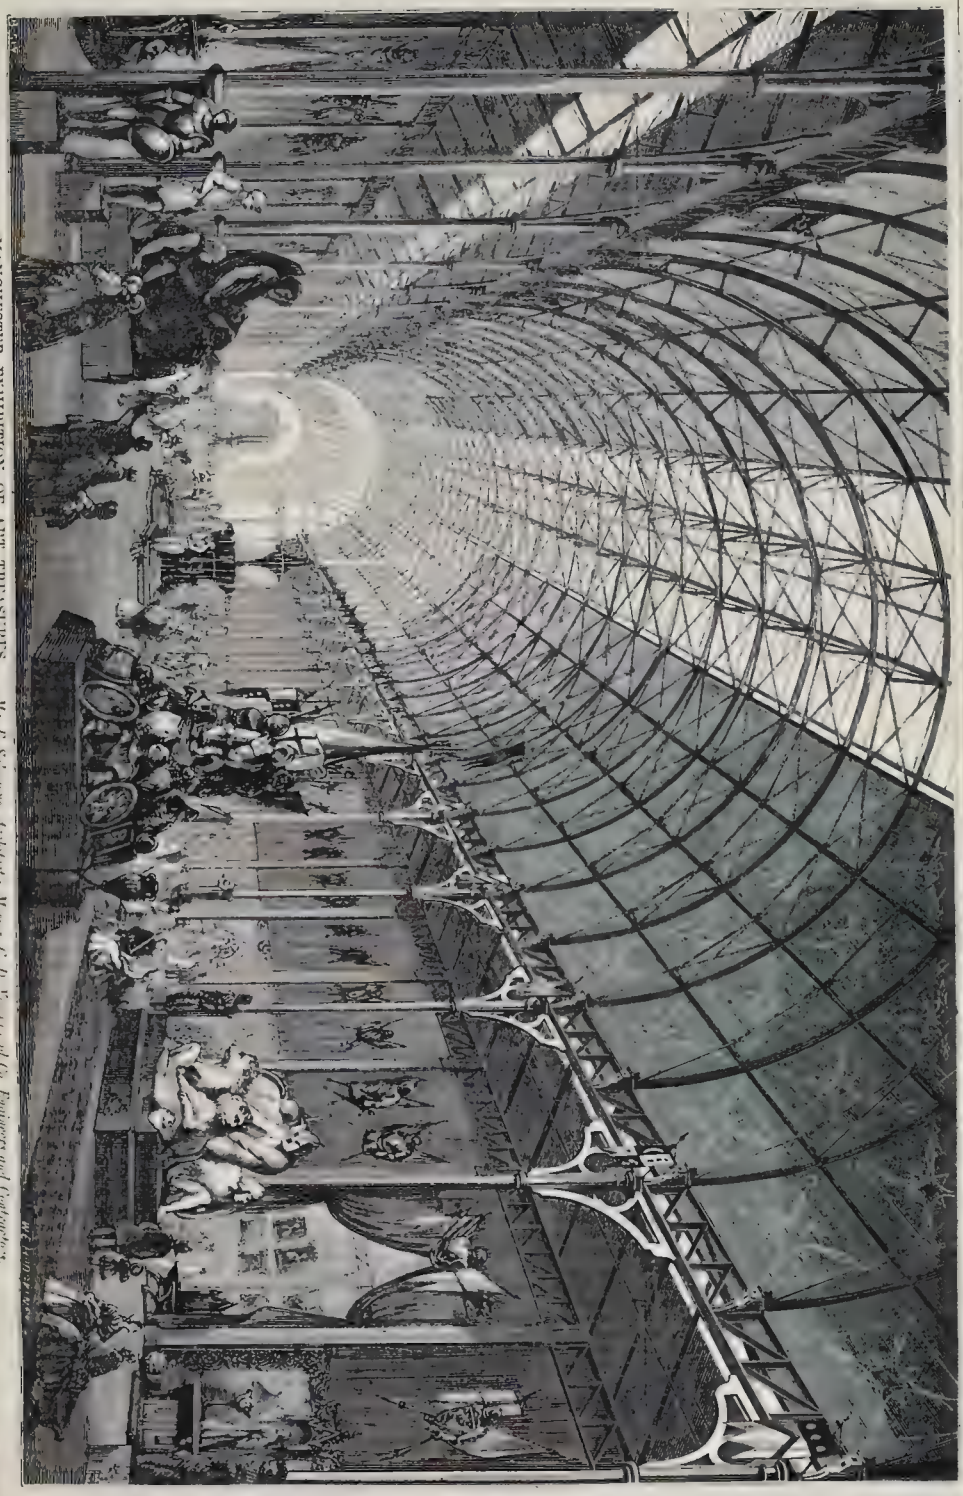
We understand that many architects have expressed their regret that they had not the opportunity to append their names to Mr. Pennethorne's testimonial. The list is not yet closed, and any of the profession can communicate to either of the subscribers on the list, or doubtless the honorary secretaries of the Institute would receive and transmit the names of those who may wish to take part in this honourable testimonial to the worth and merits of this distinguished architect.

THE LITHOTEMER, OR STONE-CUTTING MACHINE.

The great annoyance and expense caused by the repeated strikes of stone-cutters have been a serious drawback to the rapid execution of contract works. This evil has been more particularly felt in the Ordnance and Admiralty works now in course of construction at Milford-Haven, and has induced Mr. Williams, one of the contractors for Dale Point Works, to apply himself to the construction of a machine for cutting stone which shall render contractors less dependent. After several trials and experiments, he has so far matured his ideas, we are told, as to produce a machine, simple in principle, and containing the requisite power for the object desired, and has taken out a provisional protection for his invention.

The following is an outline of the plan of operation:—The stone is first fixed on a horizontal table to have its bed dressed: this is effected by cutters placed on an iron cylinder, or drum, whose axis is horizontal, and which revolves over the stone. The cutters are fixed on the drum in several series of rows, with vacant spaces between each series, so that when one series of cutters has done its work, and the vacant space is over the stone, the table on which the latter is fixed is moved forward to present a fresh surface for the next series of cutters, and so on until the bed is dressed. When both beds are finished, the stone is removed to have its face and joints dressed in a similar manner by another drum, arranged with cutters like the above, but with its axis vertical.

This machine is capable of dressing 20 superficial feet of limestone per minute, or a much larger quantity of any softer stone in the same time.



THE MODERN STRUCTURES IN THE BOTANICAL GARDEN, CARLSRUHE.

The botanical garden of Carlsruhe is one of the oldest, if not in Europe, at least in Germany. Caspar Bauhinus, the great botanist of the sixteenth century, speaks of the garden of Durlach—the former residence of the Grand Dukes of Baden, the treasures of which were subsequently transferred to Carlsruhe. When the present Regent assumed the reins of the country, he resolved to supplant all repairs by thorough new buildings, which, besides their practical adaptation, should be architectural works of art. Baudirector Hübsch, a gentleman known by theoretical and practical works, was entrusted with the erection of these structures. On the borders of the gardens of the castle stands the new greenhouse (*Orangerie-Haus*). As the orange-trees of the establishment are numerous and high grown, a large space was required. The building is 250 feet long, 50 feet broad, and of an adequate height. The side which turns towards Stephanie-street is ornamented by the principal elevation, above which rises a high cupola of glass, under which is a hall for festivals (*Festsaal*). The other part of the greenhouse is connected under a right angle with the whole remainder of the buildings, and ends at the palace, so that the passage from the palace to the end of the houses is uninterrupted, in a length of 1,400 feet. Almost in the middle of that line stands a high pavilion, through which passes the road from the botanical garden to the pleasure-grounds (*Erglische Anlagen!*) of the gardens of the palace, above which is a saloon affording a fine view over the town and gardens. A residence for the director, a palm-house, and a caldarium for exotic water-plants lie also in this line. The other portion of the building forms an arcuated gallery. In front of this gallery is a winter-garden, which forms one of the pleasantest parts of the whole. We find here trees and shrubs, which require protection during winter, but now stand quite free as in their native land. The length of this winter-garden is 400 feet by 40 feet in breadth. The great advantage of this arrangement of M. Hübsch is, that he has known how to manage things so that not even a vestige of the beams and spars of the winter protection is to be seen in summer, which was accomplished by the winter-garden having in its rear the long gallery, in the walls of which the contrivances for making the walls and roof of the winter-garden could be immitted without leaving any vestige behind when not required. The caryatides of the palm-house are made of the fine Durlach stone.

STATUE OF GENERAL SIR CHARLES NAPIER.

The hoarding which has been put up at the south-west corner of Trafalgar-square, marks the allotted site for a statue in bronze of the late General Sir Charles Napier, the cost of which has been raised by private subscription. The statue will stand nearly in a line with the vacant pedestal for an equestrian statue, and will put both sides of the square into the position of wanting completion. The statue, executed by Mr. G. C. Adams, is 12 feet 6 inches high, and has been cast in bronze at Messrs. Thompson's foundry, Pimlico. The pedestal will be 16 feet 6 inches high. The figure stands well, and the likeness is strongly marked. Simplicity and breadth characterise the treatment, and these are admirable qualities. We must, nevertheless, be permitted to say, rather with reference to works to follow than to this, that carried to extremes, especially in bronze, these qualities result in baldness and insipidity.

The Iron Trade.—An "Ironmaster," who gives a weekly account of the state of this trade in the newspapers, suggests that a reduction of 20s. might be desirable. Others are of opinion that in September there must be a considerable reduction, unless the present inactive state of the trade be very much changed. The intense heat has pretty nearly fulfilled the intent of our suggestion, that puddling should be regarded as an impracticability in hot weather. No increase of American orders as yet.

MANCHESTER EXHIBITION OF ART TREASURES.—*Mr. E. Salomons, Architect; Messrs. C. D. Young and Co., Engineers and Contractors.*

DECAY AND PRESERVATION OF STONEWORK.

A mode of efficiently hardening soft stone, and of staying from decay the various stones most commonly used amongst us for building purposes, is a desideratum of the greatest importance. The majority of our readers, doubtless, observed that, just before the close of the session, Lord Lyndhurst presented a petition from Mr. J. B. Daines, setting forth that he had patented an improved and effectual mode of preserving stone, plaster, cement, and other buildings from decay, indurating and protecting them from atmospherical influences, and neutralizing the tendency to alkaline efflorescence, the efficiency of which the authorities had declared would be decided upon in two years. He had himself seen a report from Sir C. Barry, which stated that the result of the invention, which had been tested upon 1,400 square yards of the house, had been entirely satisfactory. He desired that a committee should be appointed to inquire into the matter, but the Government thought it was too late in the session to do so.

In a letter to the *Journal* of the Society of Arts, Mr. Daines says that his attention having been awakened by an article in the *Builder* on the decay of stonework, he was led to examine the state of various stone buildings in the metropolis, especially with a view of first discovering the cause of the premature decay. He continues:—

"My experience, after a variety of tests and trials, leads me to the conclusion that alkaline efflorescence is the primary cause of the decay in stonework: this efflorescence is the result of chemical agency, not the least of which will be found in the cement or mortar employed for 'bedding' or jointing the work, as in all cases it may be observed that crystals are found commencing at the angles or joints of the work before the walls are thoroughly dry; and, in the first instance, the disintegration which follows proceeds from the alkaline matter contained in all cements and mortars now in general use. In many cases it is accelerated by the employment of sea or salt sand, which is too often used, as the damp developed on the internal walls of many of our buildings plainly testifies.

If pieces of Bath or Caen stone, an inch thick, be set with a layer of Roman cement between, and be exposed to the action of the air, it will be found, in the course of three or four years, that the cement will have so acted upon the stone as to render it capable of being crushed by pressure between the thumb and finger, in consequence of its decomposition by the chemical action of the cement. A proof of the destructive effect of salt upon stonework may be observed in any seaport town. The stone buildings which are exposed to the sea-breezes show plainly this effect. In London and large manufacturing towns the various chemical matters combined with the air form other prolific sources of decay in stonework. In certain localities, where the atmosphere is comparatively free from these influences, vegetation may be observed as accelerating the progress of decay, as instanced by the stonework of Hampton-court Palace, and the monumental work in the various cemeteries at a distance from the metropolis and large towns. Such are some of the various causes of decay in stonework.

I have endeavoured to find a remedy, and I believe that I have succeeded. I employ a solution of one part, by weight, of sublimed sulphur, in eight parts of linseed oil, heated in a sand bath to a temperature of 278 degrees Fahrenheit, by which process the vegetable mucus of the oil is precipitated, and the watery particles evaporated, and their place supplied by the sulphur, which is readily taken up by the oil at the above temperature. The solution is applied with a common painter's brush to the surface of the stone, until it will absorb no more. Sulphur is stated by ancient and modern chemists to be insoluble in water, and to suffer no change by exposure to air; and, further, it is known to be a decided foe to vegetation, and its use in bleaching is well known. For these reasons I have selected it as the basis of the indurating medium. The stone so treated becomes extremely hard, almost equal to granite, and, so far as I have been able to test its preserving qualities, a period of four years shows, not only that no decay has taken place, but time seems actually to increase its hardiness. It is simple and inexpensive in its application."

The process appears to be similar, if not the same, as that patented by Barrett, and which has been mentioned in our pages on various occasions.

PROVINCIAL NEWS.

Lynn.—The following were the tenders for construction of the quay along the Marine Parade:—Mr. W. D. Harding, Lynn, seconds timber, 3,200*l.*; best middling ditto, 3,350*l.* Mr. C. Clare, Watlington, 2,991*l.* Messrs. W. Nurse and D. Hart, Lynn, seconds timber, 2,901*l.*; best middling, ditto, 3,115*l.* 11s. Mr. James Crittle, Lynn, 3,100*l.* Mr. W. Sissons, Lynn, 3,126*l.* The tender of Messrs. Nurse and Hart for seconds timber was accepted,—the works to be completed by 25th March next, under a penalty of 20*l.* per week.

Norwich.—Thirty sets of plans have been received for the new workhouse. They have been referred to a committee for arrangement and exhibition to the local guardians and others.

Great Yarmouth.—The General Board of Health have approved the plans for the new Marine Esplanade, after suggesting certain minor modifications. Mr. Ranger, one of the inspectors to the Board, in recommending that the local authorities should be allowed to borrow 1,700*l.* on the security of the rates, for the purpose of carrying out the works, says:—"The esplanade to be made will be about 2,300 feet in length: the carriage-drive will be 26 feet. There will be two footpaths at the sides thereof: that on the eastern or sea side will be 11 feet in width; the other, near the houses, 7 feet and upwards. The drive and walks are to be supported on the seaward side by a retaining wall of concrete, 6 feet in height above the level of high-water mark, with a breast wall 2 feet in height, for a distance of about 500 feet, to stop the drifting of the sand into the houses. The retaining wall is to be coped with Yorkshire stone."

Abingdon.—The tender of Mr. J. Thomas for the erection of the new station-house for the Berks Constabulary at Abingdon, for the sum of 1,312*l.* 9s. 5d. (out of which 150*l.* is to be deducted for old materials) has been accepted.

Gloucester.—Public baths are about to be provided for Gloucester. Plans have been prepared, and it is intended to construct the building on the most approved principles. There will be first and second-class baths for ladies and gentlemen, and a swimming-bath about 70 feet long and 50 feet wide, with a fountain in the centre. The building has been designed by Messrs. Jacques, of Gloucester. The erection, however, depends on the contingency of a subscription list being filled up.

Shenstone.—The new schools erected in the village of Shenstone have been formally opened. The architect was Mr. W. Baker, and the builder, Mr. Thomas Hassall, of Shenstone.

Boston.—A new school is in course of erection near the church at Algarkirke, for the use of the Algarkirke and Fosdyke parishes, the Rev. B. Beridge being at the whole cost. The foundation-stone was laid by Mrs. Beridge. The building is progressing under the superintendence of Mr. Webster, of Wyberton; the style to correspond with the church. The building will be large, the school being in the centre, with a residence at each end for the master and mistress, with proper conveniences attached. It is to be constructed of brick, fronted with worked and chopped stone, from the Ancaster pits.

West Hartlepool.—The foundation-stone of a new bank at West Hartlepool, was laid in week before last. The building will be of brick, with stone dressings, and will be fire-proof. The plans were drawn by Messrs. Pritchard and Son, of Darlington.

South Shields.—The scheme has been revived in the South Shields Council to build a new Town-hall, in the Market-place, at an outlay of some 5,000*l.* or 6,000*l.* The funds, it is stated, will be derived from the dues and tolls collected in the market. This however, is opposed; it being argued that the surplus of the tolls collected in the market, after paying principal and interest, should be applied to improvements in that square.

Airdrie.—The foundation-stones of the Court-houses, the Market-house, and the Railway Station, of the town of Airdrie, were laid with masonic ceremonial on Thursday in week before last.

METROPOLITAN BUILDING ACT.

Decision of Magistrate that Section 13 *and the* 1*st Rule of the* 1*st Schedule were modified in the case by the Board of Works.*

Pickford, a builder, erected a one-story shop on the fore court of a dwelling-house in the Bermondsey New-road, up to the public way, to which the district surveyor objected that it was not inclosed in front with wall of brick, stone, or other hard and incombustible substances.

At the hearing of the case on Friday, 1st of August, before Mr. Secker, the magistrate sitting at the Southwark Police Court, it was shown by the district surveyor that with the exception of the brick footings and 18 inches in height of brickwork on the bres-summer, no portion of front was inclosed in conformity with the 1st rule of the 1st schedule, and that the quantity of brickwork was far less than half the front, as required by section 13, which restricts any openings to half the area of the wall. He put in a tracing signed by the chairman of the Metropolitan Board of Works and the superintending architect, and a letter from the latter, informing him that the Board had sanctioned the projection of the shop under the 143rd section of the Local Management Act, which sanction the builder seemed erroneously to consider as authorizing the construction intended to be shown by the tracing. To this the builder replied that his communication from the Board of Works differed from, and went much further than that to the district surveyor,—and he read his application to the Board, mainly requesting, under the 56th section of the Building Act, their sanction to the construction of the shop-front in woodwork, as shown on the tracing put in by the district surveyor, and only in the second place asking for leave to make the projection, it being really no projection at all. He then read the reply he had received from the Board, which gave a complete sanction to all his application, without reference to any particular Act or section.

The district surveyor argued that the Board could never have intended to sanction the drawing *in toto*, as it was insufficient to explain the construction, and that a modification of express rules of the Act under section 56, would be made in a more formal manner, reference being specially made to the enabling provision of that section.

The magistrate ruled that the Act itself requires the front to be of incombustible materials, according to the 1st rule of the 1st schedule, and that section 13 restricts the openings to the extent of one-half the area of the front, which was greatly exceeded in this instance. As, however, the tracing was signed by the chairman and superintending architect, it must be looked upon as a document of authority; and from it, as well as from the application of the builder, and reply thereto, it was a fair inference of the builder that the Board allowed all the openings which were shown by the drawing. He therefore adjudged that the builder was entitled to make the doors, sashes, and frames, as shown in the drawing, though exceeding the area allowed by the special rules of the Act; but he ordered that the builder should comply, in other respects, with the requisition of the district surveyor, by building the remainder of the front of the substances mentioned in the 1st rule of the 1st schedule, within a month.

THE BRITISH ASSOCIATION.

The general meeting at Cheltenham opened on Wednesday in last week, at the Proprietary College, with a full attendance, when the Duke of Argyll resigned the presidentship to Dr. Daubeny, and the meeting was addressed by these and various other gentlemen. The meetings in the Sections on the successive days comprised a good many valuable papers, but few requiring any special notice from us. Dr. Augustus Voelcker read one "On the Corrosive Action of Smoke on Building Stones." Mr. Duncan M'Pherson gave an account of some researches in the Crimean Bosphorus, and on the site of the ancient Greek city of Pantecapæum, at Kerch, regarding which we lately gave some notes in the *Builder*. Colonel Sir H. Rawlinson lectured on the Friday evening in the College, "On the recent Discoveries in Assyria and Babylonia, with the Results of Cuneiform Research to the present time." Mr. Tite, at Bath, we may here remark, early in January of this year, in the course of reading a paper in the Guildhall of that city on these discoveries, reproduced before his auditors, in moist clay, a portion of the inscription at Ecbatana, containing the names and titles of Xerxes. Indeed, the process is so simple that any one may repeat it. The arrow-headed character is simply made up of the form of an ancient arrow-head somewhat elongated—generally moderately so, but in the Babylonian inscriptions more extravagant in that particular. If any one desirous of repeating the

experiment will take a smooth surface of moist clay and a piece of wood about three-quarters of an inch square and 3 inches long, cut square at the ends, he will find, on pressing the angular point into the clay, he can reproduce any of the characters with the most perfect facility; and if the surface of the clay be of sufficient size, he can reconstitute, as Mr. Tite did, the Hamadan inscription. It is probable that in the cylinders and tablets this impress was made by a metallic tool or style, and of course on the sculptures and rock inscriptions the original character was only imitated; but Colonel Rawlinson has shown that the impressions on the bricks found at "Ur of Chaldees" were marked with the name of a king which he thinks identical with the Chedorlaomer of Genesis, and at least 2,000 years before Christ. On the Saturday there was an excursion to Cirencester, including a visit to the Royal Agricultural College there, and the Roman remains discovered at Cirencester. On Monday business was resumed, with a good attendance, still, in the sectional departments. Amongst the papers read was one by Mr. P. J. Worsley, "On a New Process for Making and Melting Steel;" another by Mr. W. Bessemer, "On the Manufacture of Iron and Steel without Fuel;" and another by Dr. Greene, "On a Method of uniting Iron with Iron, and other Metals, without welding," invented by M. Sisco, of Paris. Mr. Baker, the founder of the Hardwicke Reformatory, also read a paper "On Economic Science and Statistics;" and in the evening Mr. Grove discoursed "On the Correlation of Physical Forces."

METROPOLITAN BOARD OF WORKS.

The Board met in the Council Chamber, Guildhall, on the 12th inst. to consider a report from the engineer of the Board on the extension of the main outfall sewer on the southern side of the River Thames to a point in Long Reach, below Erith. The engineer said in his report;—

"I recommend the construction of a sewer, 10 feet 6 inches in diameter, 7½ miles in length, and with a fall of 2 feet per mile, commencing in the Plumstead-road, at the east end of Woolwich Arsenal, where it forms a junction with the main outfall sewer, which was adopted by the Board on the 26th May last. The extension line continues thence along the north side of the North Kent Railway, through Erith, under the river Darent, to the Thames at Little Powder Creek, which is about the centre of Long Reach, one mile below Purfleet, two miles above Greenhithe, and nineteen miles below London-bridge."

"I recommend that for eleven months in the year the discharge of the sewage into the river should take place at high water, and during the first half of the ebb-tide, and that for the remaining twenty or thirty days of heavy rain, the discharge of the then diluted sewage should also take place one or two hours before high water, by which means a reduction of the size of the covered reservoir from 15 acres to 4 acres might be effected, and an increase of its depth obtained, so that it would contain about 2¼ million cubic feet."

"The foregoing instructions, however, direct the preparation of a plan for the discharge of the sewage at, and after high water only. I therefore beg to report, so sudden and unequal are the quantities of rain that fall, that to avoid the discharge of the sewage before high water on the twenty or thirty wet days per annum, would necessitate the construction of a reservoir of double the size now proposed at an increased estimated cost of about 40,000*l.*"

"My estimate of the proposed extension to Long Reach is	£297,620
Less the cost of the sewer and reservoir across Plumstead Marshes	114,580
	£183,040
This added to the estimate of the southern drainage	831,696
Gives a total of	£1,014,736

The chairman said he should like to make a suggestion to the Board with reference to the subject before them. He said the engineer was of opinion that by lowering the sewer on the south side of the Thames, that by increasing the sewage it would take into the Thames, and in forming junctions as the case might be, it would enable him to proceed, as the Board might direct, farther down the river with the sewage of the whole metropolis *in one line*. The question arose whether it was not worth the consideration of that Board to provide the Board with some information as to the cost of carrying the sewage down to the northern district, and getting rid of a pumping station at Deptford Creek, crossing it by one line underneath the Thames; whether that information should not be before the Board while they were discussing the question of where the point of discharge should be. There was one other point which the engineer had repeatedly made, namely, that he felt a difficulty in taking in the western area on the northern side; the engineer thought that the upper towns would go upon the principle of deodorising, and that there would be an advantage in cutting off the western district.

After more than four hours' talk, the greater part of it worse than useless, the whole question of the drainage of the metropolis was referred back to the engineer.

The engineer said, in reply to questions, that he had already advised what he believed to be the best plan, but he could place before them other proposals, and the Board could then decide between them.

Mr. Nicholay presented a memorial from Mr. J. R. M'Clean, setting forth a scheme for conveying the sewage of the metropolis to a point on the lee shore of Essex, between the estuaries of the Crouch and Blackwater Rivers, and for the utilization of the same as manure, and effectually to cause the purification of the Thames.

The consideration of it was deferred.

MEMORIAL OF THE GREAT EXHIBITION OF 1851.

I addressed a communication to you on the above subject some time since, complaining, that although funds had been collected for its purpose years ago, nothing had yet been done; and in consequence, I am gratified at length to learn, through the columns of the *Daily News*, that "the money subscribed for a memorial of the Great Exhibition *is* to be devoted to the purpose for which it was subscribed;" and I further notice, that two gentlemen known to the public, and who are named, have consented to act as honorary secretaries. This certainly looks like business, and holds out somewhat solid hopes that the "consummation devoutly to be wished" will now shortly be carried out.

Nothing, I am somewhat disappointed to perceive, is definitely stated as to the *locale* of the memorial, although this is an all-important feature in the matter. The spot, in Hyde-park, on which the Great Exhibition itself stood, is the only appropriate one to embody the sentiment given birth to in the movement, as well as satisfy the requirements of the subscribers. Pray advocate this in your own language, at an early opportunity, otherwise I have some misgivings that the monster "red tape" may even now take some pains to raise objection to its being placed there. Member of the Society of Arts.

*** Beyond the resuscitation of the committee, and the enlistment of two honorary secretaries, anxious that the money raised should be applied to the advantage of *art*, nothing has yet been done. The first steps taken will doubtless be to obtain if possible permission to erect the memorial on the site of the Exhibition building.

GILDING ON GLASS.

In reply to your correspondent, glass may be prepared to receive any coating, metallic or otherwise, by etching out the parts intended to be coated with hydrofluoric acid. The commercial solution of the acid may be used for the purpose, or its vapour may be evolved from a mixture of fluor-spar and concentrated sulphuric acid by the aid of heat.

In either case, those portions of the vitreous surface *not* intended to be corroded must be protected from the action of the acid by a film of some resinous substance—such as caoutchouc, from its solution in benzole, or bees-wax to which has been added a little ordinary colophony or resin.

The slightly roughened surface produced by hydrofluoric acid on glass affords a good hold for metallic depositions. Wentworth L. Scott.

SANDERSON'S PROCESS FOR REFINING IRON.

The objects of this process are—1. To reduce the loss of metal, and to use coal as fuel instead of coke.—2. To effect a uniform decarbonisation of the pig-iron without the aid of blast.—3. To use a chemical re-agent capable of giving out oxygen during its decomposition, which taking up and uniting with the carbon evolved from the metal produces carbonic oxide gas, which acting upon the earthy compounds contained in the pig-iron precipitates the metal contained in them.—4. To effect a greater facility, and also to produce a greater economy in the cost of manufacturing refined metal, by decarbonising it, and at the same time clearing away the unreduced or earthy matter with which pig-iron necessarily becomes mixed during its descent through the blast-furnace; and, further, to effect an economy (by using a purer metal so obtained) in the manufacture of malleable iron, causing less waste in puddling, and also in the subsequent re-heating required for producing bar, rod, or sheet iron. In reference to this process the *Mining Journal* says,—"The inventor appears to have succeeded in effectually accomplishing that which Karsten and others have pronounced as impracticable. He has left unnoticed in his specification all the various plans which have been patented for the use of chemical re-agents in the puddling furnace; but when the iron is in a fluid state he uses certain re-agents, which are of such a nature as to fulfil the object specified: he purifies the metal, and frees it from its deleterious matter, and at this stage he runs it out into a mould, thus taking advantage of its fluidity to separate the scoria from the metal. Instead of charging common pig-iron into the puddling furnace, and producing from it malleable iron, which is largely amalgamated with those deleterious substances which such pig-iron contains, Mr. Sanderson uses this refined metal as a raw material, which, being perfectly pure, produces a tougher, stronger, and cleaner iron than that usually made, and that also with greater economy, since the waste of metal during the processes of manufacture is less when a pure metal is used instead of an impure one. We have obtained a small sample of this refined metal, and shall be glad to show it to any one, particularly those who are engaged in this great staple of our empire. We are informed that the cost of producing this metal does not exceed 6*s.* to 7*s.* per ton, including the royalty, and that the furnace used by the inventor will refine the crude iron as quickly as the blast furnace can produce it. No blast is used; no coke: the waste in refining is not one-fourth of that experienced upon the old plan."

Notices of Books.

The Lost Solar System of the Ancients Discovered. By John Wilson. In two volumes. Longman and Co. London. 1856.

The title of this book gives not the slightest idea of the true nature of its contents. Curiosities of architecture and engineering throughout the world in all ages, but especially in ancient times, and connected with religious observances, make up the most of its contents. These are strung together occasionally by means of a weak and loose thread of most fanciful speculation, in an algebraic form, according to which ancient pyramids, towers, teocallis, pagodas, temples, obelisks, &c. were built to represent the laws of gravitation, the distances between the earth and the moon and the sun and the earth, the earth's circumference, &c.: no amount of measurement appears to have come wrong to the industrious author: if the sum of all the measurements of a building do not amount to the precise distance between the earth and the moon, or to the exact circumference of the earth itself, they form ⅛th or ¼rds, or $\frac{1}{15}$th, $\frac{1}{17}$th, or any other fractional portion of the whole amount. Perhaps there may be some little vestige of truth in this wild speculation, as for instance, where the author endeavours to prove the Egyptian obelisk to represent in its tapering form the law of increasing force, according to which bodies fall to the earth in successive moments, but such a fabric as he has reared, on premises so fanciful and vague, surely never before appeared in print. And yet, the author is by no means original in his idea that the religions of ancient heathen nations were closely connected with astronomy. It is long since such ideas were first maintained; indeed, even ancient authors as well as modern, at a loss to explain the meaning of the mysteries practised amongst the Chaldeans, Egyptians, Greeks, &c. have adopted the astronomical theory,—if it may be so called; and the "sun" worshippers of the far east, as well as those of the far west,—those of America as well as those of Asia,—gave, perhaps, quite sufficient occasion in their outward observances for such a belief; but their higher initiations told another tale. The "sun" of these mysteries was no less an inward and a spiritual light than the "sun of righteousness" himself, whom, indeed, these secret rites, heathen though they were, distinctly *represented*. To suppose that the "heaven," and the "heavenly host," who were anciently worshipped, were no other than the outward stars and planets, sun and moon, was to ignore all those records of secret doctrine which have been handed down to us, and which clearly show that the "heaven" to which the eyes of the initiated worshippers, even amongst the heathen, were turned, was no more "outward" than the "heaven" of the Bible which is "within" the human organism,—as much so, indeed, as is the "sun" which is to "arise upon" that organism, to shine within it, and to make it a luminous and "glorious body," "full of light as when the bright shining of a candle giveth *us* light."

The author of the singular book now under notice, takes the Tower of Belus as the grand archetype of all other "high places" through-

out the earth, and he shows a strong analogy between that tower and many other structures devoted to religious observances, both in the "old" world and the "new." The tower and temple of Belus or Baal, according to Herodotus, who saw it while at Babylon, stood in the holy place dedicated to Jupiter Belus, on one of the banks of the Euphrates, where the city stood. The tower consisted of eight towers, one within and above another, with a winding staircase to the top, and a lodge and seats midway up,—for temporary rest or repose, as it would seem, by the way. On the topmost tower was a chapel, and in the chapel a golden table near to an elegant bed on which *by night* reposed a woman, chosen by the god Bel, or, in fact, as it may be truthfully explained, in whom, as in an oracle, "the god" appeared, in this his temple, "house," or chapel; for similar edifices, on the analogous Mexican teocallis, are known to have been called "the house of the god." Diodorus Siculus states that the temple at the summit of the tower of Baal or Belus, had an altar, but in all probability this altar may have been the bed described by Herodotus, if not the golden table. Diodorus also speaks of three statues, which he named Jupiter, Juno, and Rhea; but Herodotus saw no statues, although he speaks of the "chosen" woman, or priestess, who reposed on the bed or couch. Strabo describes the tower of Bel as a pyramid, one stadium in height, and one stadium in breadth at base. The pyramid or tower of Babel is also described as having been a tomb as well as a temple.

Now Diodorus certainly reports that the temple at Babylon served the Chaldeans as an observatory, and Pliny remarks that Belus was regarded as the inventor of astronomy; but let us see whether it be at all likely that the pursuit of astronomical science, or the worship of "the heavenly host," physically and literally speaking, was the chief purpose of the erection of such a structure. In the first place, we know from Scripture that the main purpose of the erection of the original tower of Babylon was an attempt thus to reach "heaven." Taking the word heaven in its literal and not in its scriptural sense, how was the repose of a woman on an elegant bed likely to promote either the observation of the stars, or the upward progress towards the firmament itself? The idea is too gross and absurd to be for a moment credited in the face of such an account of the tower at Babylon as Herodotus has given. That account, however, is in perfect accordance with an endeavour to reach that inward "heaven" of ecstatic repose and "divine absorption" which to this day constitutes the earnest desire of such eastern devotees as those of India and China. And that the doctrines of other ancient and wide-spread religionists partook of such aspirations after heavenly rest and perfection, and aimed at the realization of them by just such means as those betrayed in the paraphernalia of the little temple, chapel, or "house of the god" at Babylon, could be here easily and fully shown were this a fitting place for the proof. An instance or two, however, may be adduced. As respects the Druidical religion, which at one time prevailed over vast tracts of the earth's surface, Davies thus translates the account which Taliesin, a Druidical noviciate, gives of his probation: "I was first *modelled* in the form of a *pure man* in the hall of Ceridwin, who subjected me to penance. Though small *within my ark*, and modest in my deportment, *I was great. A sanctuary* carried me above the surface of the earth. Whilst I was enclosed within its ribs, *the sweet Awen rendered me complete.*" Davies thence infers that the Kist-vaen (such as Kit's Cotty-house in Kent) was very probably the *ark* here referred to: the kist-vaen, like other Druidical monuments, is found in parts of the world widely separated. There is said to be one on the banks of the Jordan which resembles Kit's Cotty.

In "Scenes and Impressions of Egypt," the author, while on a visit to the Temple of Dendera, and in allusion to affinities between the Hindoo and the Egyptian worship, says,—"While on the staircase, the priest and the sacred *ark* must have reminded him, and strongly, of the Brahmins *and the palanquin litter* of his native country,"—a remark which, as we shall now endeavour to show, all at once transports us from the ancient and obsolete worship of the Egyptians, Druids, and Chaldeans, to the extant,—living worship of the Chinese at this very day.

In the *Morning Herald*, of 23rd or 24th September, 1854, is a curious article on the religious tenets of the Chinese insurgents, in the shape of a translation, by the well-known Chinese scholar and missionary, Mr. W. H. Medhurst, of an official statement made under the authority of the Celestial and other "kings" of the revolution. From this official document we shall make but a single extract, illustrating its meaning by help of a note by the translator.

"The servant said, 'The eastern prince is enjoying *repose* in the *sedan*, and I do not dare to disturb him.' The chamberlain of the northern palace hearing that the eastern prince was enjoying repose, did not presume to repeat the inquiry, but hastened back to inform the northern prince. The northern prince hearing that the eastern prince was enjoying repose, hastily descended from his sedan, and proceeded on foot to the middle of the road, where he *knelt* down and *inquired*, saying,—'Has the *Heavenly Father* troubled himself to *come down to this world* again?' To which the Heavenly Father replied in the affirmative, telling the northern prince to convey the sedan into the *Hall* of *Audience*. The northern prince replied, 'I will obey the injunctions of the Heavenly Father;' whereupon he hastily commanded the female officers of the court to inform the Celestial King of the circumstance; which done, he, together with the ministers of state and the other officers, conveyed the sedan of the eastern prince within the gates of the palace. The Celestial King, Thae-ping-wang, having heard the message which the female officers brought from the northern prince, intimating that the Heavenly Father had taken the trouble to come down into the world, hastily went on foot to the second gate of the palace to receive the Heavenly Father [who had thus *appeared* in the body of the *reposing* inferior of the "Celestial King"]. The last-named [the Heavenly Father], on his arrival, was angry with the Celestial King, saying, Sew-tseuen! You are very much in fault: are you aware of it? The Celestial King, kneeling down with the northern prince and all the officers, replied, saying, 'Your unworthy son knows that he is in fault, and begs the Heavenly Father graciously to forgive him.'"

In order to enlighten the West on the subject of this strange proceeding in the East, Mr. Medhurst says,—

"There is here some need of explanation in order to assist the general reader to understand the subject. The eastern prince, it appears, had seated himself in his sedan, and was about to proceed to the court of Thae-ping-wang, when it was said, all of a sudden, that he *was enjoying repose, which means, that he had fallen into a* TRANCE. While in that state it is pretended that the Heavenly Father had taken possession of his body, and, without the individual affected being conscious of the fact, he says and does things which are supposed to be the sayings and doings of the Heavenly Father. The northern prince seems to have been aware of the supposed possession as soon as he heard of the *repose* of the eastern prince, and therefore alighted from his chair, knelt down in the middle of the road, and asked if the Heavenly Father had *come down*. The colloquy that ensued was between the eastern prince—personating the Heavenly Father—and the northern prince (and Celestial King). The trance over, exhaustion succeeded, and the eastern prince was informed of what had happened, of which he himself pretended to be unconscious. *Such pretended possessions are common in China.*"

They are also common to this day in India, and not uncommon even amongst the native Americans. Now, whether this be all imposture, delusion, or truth, is a matter of not the slightest importance, so far as regards the object we have in view, which is, to shed some new light on the true meaning and the actual purposes of those ancient structures devoted to religious or to quasi-religious observances, more especially in ancient times. Indeed, that object is better served on the hypothesis that it is delusion than on that which implies its truthfulness. Let us at once take for granted that all such practices were a delusive similitude only of the truth as regards divine possession: still in these delusive practices we find the true key to all the mysteries of magical and heathen temple rites. The *bed* in the chapel of the tower of Baal at Babylon was, like the sedan or palanquin of the eastern prince, the place in which the entrancement of the chosen tabernacle, or body, of the oracle, took place. That chosen one was often a female, as in the Theban and the Delphian Oracles, as well as in the Oracle at Babylon. Iamblichus, while treating of the Egyptian invocation of the God in him who "reposes on the "beautiful couch" (as in the "elegant bed" at Babylon), says that, in uttering the invocation, the invoker [on the couch] "became, as it were, a divine person," or a God. This is in perfect accordance with the Chinese idea as illustrated by Mr. Medhurst.

The practice of entrancement in China, referred to by this gentleman, is a practice closely connected with the Buddhist religion which *comprises a full half of the whole human race*, and is hence well worthy of serious investigation and consideration with reference to their temple worship, especially when we recollect that even the Apostles of the Christian religion, "as they prayed *in the temple, fell into many trances.*" The Buddhist practice of entrancement responds to, and is identical with, the absorbed state of the Brahminical religion or philosophy of India, and with the enchantments practised in the temples of the Magi, in Chaldea, and also in Egypt, where there were dark temple chambers devoted to the sanitary "temple sleep" of the Egyptian Æsculapius. The Brahminical state of entrancement is held, by "the enlightened twice-born," or Brahmins, to be a third and separate state, of unworldly or spiritual existence, co-ordinate and co-equal with, though in these times rarer than, the two ordinary states of waking and sleep, and is regarded by them as an awful state of death or of self-annihilation and "absorption" into "the divine abyss," a metamorphosis effected, like the spiritual marriage of the Rosicrucians, by the exercise of fasting, watching, prayer, and contemplative abstraction, as taught even by Plato and Plotinus in ancient times, and as practised, or pretended or supposed to be practised, as well as preached, by the living generation of Brahmins and Fakers in India; constituting, in fact, the very same thing as those desired and anxiously prayed for flights of the "winged" soul to "heaven" (in the nightly "repose" of entrancement or ecstatic "rest" *in* the veiled "glory" of the Isiac "midnight sun"), the *restitution* of which the ancient Egyptian hierophants explicitly declared to be the grand object and end of their religion; so that to suppose anything connected with the mere astronomy of the outward heavens to have been the actual subject of religious worship or observance in ancient times and temples, is expressly to contradict the evidence of tradition so far as regards the Egyptians. There are even modern magi in Egypt who, like the Chinese, still evoke the state of entrancement, especially in youths, by help of fumigations with incense and other processes, for the purpose also of causing them to see visions or have optical illusions, as Mr. Lane narrates in his work on the modern Egyptians; and the same thing occurs in India, and also in Thibet and Tartary amongst the Buddhist Llamas, priests, or monks.

It is by pursuing the hints here thrown out to their vast and comprehensive issue, and not by fanciful astronomical theories, measurements, and calculations, that the real objects, purposes, and significations of the *imposing* and *astonishing* structures of ancient engineering and architectural science and skill throughout the world will be elucidated; and to that end the work now before us is highly capable of contributing, notwithstanding the ill-spun and fragile thread of astronomical hypothesis which pervades it; for it contains an extensive collection of curious detail totally unconnected with any such hypothesis,—ill-arranged certainly, but of decided value to every one interested in the Cyclopean and other works of extreme antiquity, and in the magical and other doctrines with which these great works were really connected.

FATAL ACCIDENT AT EDINBURGH.—In demolishing the tenement in Leith Wynd, the gable of which lately fell down, several persons have been killed and others severely injured by the fall of the front wall. A woman and two children were also seriously injured in the house opposite, which was partly knocked down by the fall of the ruin.

Miscellanea.

Fire at Messrs. Broadwood's Factory.—A disastrous fire occurred on the 12th inst. at the Piano-forte Factory of Messrs. Broadwood. The origin of it is unknown, but in an establishment where so much polishing work must go on, and hence so much oil, and cotton, turpentine, &c. must exist in mutual contact, even spontaneous inflammation may have caused it. Several hundred workmen will be thrown out of employment, and a great number have lost their tools, some of which were insured, but many not. It is much to be regretted that workmen will not adopt this easy mode of securing the value of their property. There is no difficulty whatever in doing so. It is a practice we have often urged, and we hope that experience, such as the present, will at length induce the general observance of tool insurance as a rule with but few exceptions.

Wolverhampton School of Practical Art.—The annual meeting in connection with this Institution, was held on Monday before last. The walls were covered with the drawings of the pupils in various stages of progress. A considerable number of the drawings shown represented parts of the human figure and architectural ornaments drawn from casts, Mr. R. Kettle, one of the vice-presidents, took the chair, in the absence of Lord Hatherton, the president of the Institution. The secretary read the report, which stated that the evening classes numbered sixteen less pupils than at the same time last year, partly owing to the establishment of a class at the Free Grammar School, conducted by Mr. Chittenden, the master of the school of art. The day classes had considerably increased in numbers, and the aggregate fees had been increased from 162*l.* 10s. 9d. in 1855 to 170*l.* 9s. in the year now terminated. Eighteen pupil teachers connected with the various parochial schools of the town and neighbourhood were under training in the school, and were admitted for half the usual fees. The annual subscriptions were 17*l.* less, which was attributed to the pressure of national and local taxation. An effort had been made to relieve the Institution from debt, and nearly 700*l.* had been contributed. There still remained, however, 450*l.* to be paid off. After some other proceedings, the prizes were distributed by the chairman.

Electro-telegraphic Progress.—The Hughes Printing Telegraph Instrument, says the *New York Commercial Register*, is now finished, and will be placed upon the line between this city and Philadelphia. This invention, it adds, may be called a printing-press and telegraph instrument combined, for it prints all messages in plain Roman capitals, with unerring correctness, and at an almost incredible rate of speed, averaging in the ordinary despatch of business from 20,000 to 25,000 letters per hour. It also demonstrates the practicability of sending and receiving messages in opposite directions over the same wire at the same time.——It now seems really probable that the scheme for uniting America and Europe by means of the electric telegraph may very shortly be realized. The *New York Times* of 8th July states that a small steamer, the *Arctic*, had left that port to take soundings preparatory to laying the submarine cable from Newfoundland to Valencia Bay, on the western coast of Ireland. Between these two points the bed of the ocean rises in a long level plateau, running east and west, of considerable width, and composed of sand and shells, presenting a remarkably level surface. Lieutenant Maury calls it the telegraphic plateau.——It was found the other day, according to the *Dumfries Courier*, that the wires of the magnetic telegraph betwixt Carlisle and Dumfries would not work properly, and an examination of the line having been made, it was discovered that near Gretna, where a portion of the iron tube in which the wires are enclosed is not covered with earth, the great heat had warmed the metal to such a degree as to soften the gutta-percha which encased the wires, and these coming in contact with each other the magnetic current was broken. It is supposed that other parts of the line have been similarly affected.

Sanitary Improvement in the City.—It is gratifying to observe, that those blots on the fair fame of the metropolis in its courts and alleys, to which years since we pointed attention, both in the *Builder* and in "London Shadows," are gradually being erased by the City authorities. The state of Fox and Knott-court, for instance, has just formed the subject of a portion of one of the City officer of health's reports to the City Sewers Commission. This court, it appears, has at length been thoroughly inspected, and orders have been issued for "such improvements as the place will admit of." The short supply of water is specially referred to, and the necessity of remedying this admitted as very urgent. The whole court, adds Dr. Letheby, must, from its dilapidated state, ere long be brought under the notice of the surveyor. Progress is also being made towards the amendment of other courts and alleys.

Lowestoft *v.* Yarmouth. — At Ipswich, before Mr. Justice Coleridge, the case of Preston *v.* the Norfolk and the Eastern Counties Railway Companies came on upon 30th ult. This was an action brought by the commissioners of Yarmouth harbour in the name of their clerk, pursuant to the direction of the Master of the Rolls, in which the plaintiff complained that the defendants had wrongfully diverted and abstracted the waters of the rivers Yare, Wensum, and Waveney, which of right ought to flow into and through Yarmouth harbour, and had turned the same into Lake Lothing, and thence into the sea, through Lowestoft harbour. From the opening statement of council for the plaintiff, it appeared that plaintiff filed a bill in Chancery to compel the reparation of the locks, and to restrain the defendants from diverting any of the waters of the rivers for the supply of the cut between Lake Lothing and the sea, which they advanced a right to do under their Acts. The Master of the Rolls held that the defendants were bound to repair the locks as a public duty, and he ordered them so to do. He, however, expressed an opinion that they were entitled to take some water through them for the supply of all the cuts, including that into the sea, but did not define the quantity, leaving the plaintiff to bring such action at law as he might be advised, for ascertaining the precise rights of the parties in this matter, and the exact damage, if any, done by default of the defendants. Hence this action, in answer to which the defendants pleaded separately— 1. Not guilty. 2. That the plaintiff was not entitled to the waters in question. 3. A justification under the Norwich and Lowestoft Act—each company alleging in its plea that the acts complained of by the plaintiff were done by them as the servants of and under the orders of the other. After much discussion, the terms of a reference to Mr. Biggs Andrews, Q.C. were arranged, the defendants undertaking to repair the locks at once, and to proceed speedily, the plaintiff being let in to complain of acts of omission, as well as of commission, on the part of the defendants. A verdict was then taken for the plaintiff, subject to the special case.

Institution of Mechanical Engineers.—The general meeting of the members of this Institution was held on Wednesday in last week, at the house of the Institution, in Birmingham, Mr. S. Lloyd, in the chair; when the secretary, having read the minutes of the previous meeting, and a number of new members having been elected, a paper was read "On the application of Steam-power to Agricultural Purposes," by Mr. William Waller, of Lincoln. The next paper was a description of a "Double Traversing Drilling Machine," by Mr. Thomas Forsyth, of Manchester. The last paper was on an improved "Water Meter," by Mr. O. William Semens, of London, and was a supplement to a previous paper on the subject. The chairman then announced that the next meeting of the Institution would be a special meeting in Glasgow, in the middle of September, which it was contemplated to continue periodically.

Church struck by Lightning.—During a thunder storm on Thursday week, the lightning struck the tower of Holy Trinity Church, in Stretford New-road, Hulme, Manchester. It fractured one of the pinnacles on the top of the steeple, large pieces of which fell through the roof of the tower in two places, and through the church ceiling into the church below. The whole of the pinnacle was shaken down to the roof of the tower, and several pieces of stones were hurled into the road. The damage is being repaired by Messrs. Eastwood and Son, builders. The cost will be about 20*l.* There is no lightning conductor to the church, and this is generally the case where such accidents happen, as we have often pointed out; and even where a conductor may exist, there is usually something defective in it under such circumstances. Surely a conductor will now be put up at the church under notice.

South Shields Burial Ground Competition.—Some competitors complain that, having submitted designs for the South Shields Burial Ground, and the first premium having been awarded long since, they have not been able to obtain information as to the second premium, and when the drawings would be returned.

Sale of Land.—An allotment of nineteen leased plots on the Roundhill-park Estate, Brighton, took place on Thursday, the 7th inst. at the offices of the Conservative Land Society. The plots are leased at the yearly rents of 7*l.* each for four of the plots, and 10*l.* 10s. each for the remaining fifteen plots, for the term of ninety-nine years; and the prices fixed were 84*l.* each for the former and 126*l.* for the latter. The competition was animated, and the whole of the leased plots were taken by members holding rights of choice within the first 100 numbers on the register; 20*l.* premium for each right, it is said, being paid in many instances. Other plots were sold on the St. Margaret's Richmond, Maldon South Essex, and Woodbury-park, Tunbridge Wells, West Kent, estates.

Norwich Free Library. — We have received some printed comments on this building of a not very flattering description, put forth as the "Observations of an Architect." These serve to show that the building must be of an odd character, but are couched in such strange language as to forbid much faith in the dictum of the writer. Take a specimen:— "In the first place, the Antea being raised upon a brick plinth instead of a wrought stone Podiam and Stylobata, and the Antea being greatly and disproportionately diminished from one-third of its height upwards to the cap in front; and the same in the profile, which not only conveys deformity in effect, but is contrary to the practice shown in any specimen of legitimate architecture. And the stone entablature (viz. the architrave and frieze), are sunk in the red brick wall without any projection, whereby it conveys no idea of support from the Antea, and is, therefore, contrary to every prevenient example. And the corona of the cornice is of an extravagant and disproportionate projection,—and the chambranle, or stone margin, which surrounds three sides of the apertures, are too trifling and diminutive to produce their proper effect,—and the sagitta, or keystones of the arches, are wrought vermicular on the face, a practice in the present date entirely exploded and obsolete with professional architects, and never was at all in character with any of the orders of architecture, but is supervacaneous and form an entire anomaly therewith; and sinking of the stone subsills on the face, which always appear as solids, is contrary to all precedence in existence."

Wiltshire Archæological Society. — The annual *réunion* of the members of this society commenced on Tuesday in last week, at Warminster, and was attended by a large number of the archæologists of the county. The public proceedings commenced at one o'clock, by the general meeting of the members in the Town Hall. In the absence of the Marquis of Bath, the president of the society, the chair was taken by the Rev. Prebendary Fane, Vicar of Warminster. The chairman, in opening the proceedings, explained the objects of the society. Mr. Lucas then read the council's report for the year, which stated that there was little to add to the last year's report. Mr. Sydney Herbert was elected president of the society. The Rev. J. O. Picton then delivered an address on archæology, and the members adjourned to the National School-room, where a dinner was provided for the party, which filled the large room. In the evening a *conversazione* was held in the Townhall, in the course of which papers were read, and next day the members of the society were to assemble at the Town-hall, at ten o'clock, when the Rev. J. Wilkinson was to read a report "On a Scheme for the Parochial History of Wilts, with Notices of Broughton Gifford;" after which (by permission of Mr. Temple), an excursion was to proceed to Battlesbury and Scratchbury, under the direction of the Rev. J. Baron; and an excursion to Longleat was also to take place, visiting first Clay-hill, and proceeding thence, by way of Prospect-gate, to the Marquis of Bath's mansion, at which the members and subscribers were to be received by the president. A paper, "On Longleat," was to be read by the Rev. Canon Jackson, secretary, after luncheon. On the return route to Warminster, Woodhouse Castle (of which Mr. Wansey was to read a brief notice on the spot), and Horningsham church, were to be visited.

Greenwich and Deptford.—The sanitary state of Greenwich and Deptford appears to be very bad. At a late meeting of the District Board of Works, the medical officer presented a report as to the condition of the poor inhabitants of the locality. It appeared that at Griffin-street, Deptford, where the cholera raged fearfully in 1854, the houses are occupied by six or seven families in each, and that in one house four deaths had taken place from typhus fever; also that one of the City missionaries who visited the house caught the disease and died. At Greenwich, in the eastern district, seventy-six houses derived their supply of water from tubs sunk in the marshes, the water in them mixed with the contents of stables and cesspools. It was resolved that the owners of these houses should provide a proper water supply, and the state of Griffin-street, Deptford, was referred to a committee.

Protection of Metallic and other Surfaces.—Mr. G. E. Cook, of Greenock, has invented a composition for protecting exposed surfaces, or surfaces liable to oxidation, deterioration, or decay, and which is said to be applicable to all kinds of ironwork, brickwork, stonework, plasterwork, Roman cement, and, amongst other things, to mirrors or silvered glasses. In making up this composition, from two to six pounds of gum shellac are dissolved in every gallon of methylated spirit; or, instead of methylated, wood spirit may be used. The dissolved gum may then be mixed with any suitable colouring matter, and is to be applied to the surface to be protected like ordinary paint or varnish.

British Archæological Association. — The proceedings of the Congress to be held at Bridgewater, on the 25th, will be opened with a public meeting in the Town-hall. Introductory Sketch of the Antiquities of Somersetshire, by Mr. Pettigrew. —Examination of Churches, &c. — Evening Meeting at the Town-hall, for papers, and on each following evening.—On the 26th, Visit to Glastonbury Abbey, Church, Abbot's Kitchen, the George Inn, &c.—Wells Cathedral, Close, Palace, St. Cuthbert's Church, &c.—27th. Visit to Martock — Stoke-sub-Hamdon—Stoke Church—Hamdon-hill—Montacute, remains of the Cluniac Monastery—The Church—Brympton Church—Yeovil Church.—28th. Visit to Clevedon Church, Walton Castle and Church, Weston in Gordano Church, Canenor Court, Clapton in Gordano Church, Cadbury Camp, Tickenham Church, Clevedon Court. On the 29th they go to Bath. Reception at the Bath Royal Literary Institution—Examination of various Churches—Conversazione; and on the 30th, there will be an Excursion to Hampton Down, Belgic Settlement—Bath-Hampton Church—Batheaston Church—Langridge Church—Waller's Entrenchments—The Camps—Chapel on Lansdown, with the closing meeting.

The Bell for the New Palace at Westminster.—On the 6th instant, the great bell for the Clock-tower of the New Palace at Westminster was cast at Messrs. Warners, Lucas, and Barrett's furnaces, at Norton, near Stockton-on-Tees. The mould had been in course of preparation for the previous six weeks, and two reverberatory furnaces, capable of melting 10 tons of metal each, had been built expressly for the purpose of casting this monster bell. The furnaces having attained the requisite heat, their doors were opened, and the operation of charging, or putting in the metal, commenced, occupying about one hour, and, in less than two-and-a-half hours, the whole of the metal required (18 tons) was in a state of fusion. On the signal being given, the furnaces were tapped, and the metal flowed from them into a pool prepared to hold it, before being admitted into the bell-mould: the shutter or gate was then lifted, and the metal allowed to flow, which in five minutes completed the casting of the bell.

Monumental Window at the Army and Navy Club.—A memorial window, in commemoration of officers who have fallen in different battles, is about to be erected on the principal staircase of the Army and Navy Club, Pall-mall. The window will be composed of the "Brilliant-cut Glass," invented by Messrs. Mark Bowden and Co. of Bristol, to which firm the manufacture has been entrusted. It will be in the Venetian-Italian style, and will exhibit a number of tablets bearing the arms of the club and the names and dates of the engagements. The architraves will be of Sienna marble, with panels of black marble, on which, in letters of gold, will be inscribed the names of the fallen officers.

Metropolitan Association of Medical Officers of Health.—The medical officers of health recently elected in the metropolis under the Local Management Act of Sir Benjamin Hall, have formed themselves into an association for the purposes of mutual assistance and the advancement of sanitary science. Mr. Simon, of the General Board of Health, has been elected the president for the present year; Dr. Thomson and Mr. Liddle, vice-presidents; Dr. Aldis, treasurer; and Dr. Hillier, secretary. Provisional committees have been appointed to inquire into various subjects affecting the public health, such as the sale of unwholesome meat, the condition of the vaults under the metropolitan churches, &c. There are in the metropolis at present forty-seven medical officers of health.

The New Church of St. John, at Isleworth. —This church is situate at Woodlands, near Springgrove, and is in the Perpendicular style, from the design of Mr. Deason, architect. The chief materials are Kentish rag, with Bath stone dressings, and the edifice is ornamented at the south-west angle by a tower, 80 feet high. One of the principal features is an open timber hammerbeam roof. The pulpit is of Caen stone. Messrs. Dove, Brothers, of Islington, are the builders. The church is calculated to hold upwards of 800, and has been erected at a cost exceeding 5,000*l*.

Kilkenny Archæological Society.—The July meeting of this society was held at Kilkenny on the 2nd ult. when fifteen new members were elected, and various presentations to the library and museum of the society made. A communication was then read on the Insignia of the Corporation of Cork by Mr. R. Caulfield. Fac-similes of remarkable autographs were sent by Mr. H. J. Hoare, from the State Paper Office. A communication on the antiquity of clay tobacco-pipes was received from Mr. G. Bem, of Liverpool. Other papers were afterwards submitted to the meeting, which then adjourned to the first Wednesday in September.

Street Pavement.—In the number of the *Builder* for July 27th is an article on street paving. I have thought much on this subject, and I would suggest the following:—A lime concrete foundation 6 inches thick, on which place lines of wood blocks, each block 10 inches deep, 4 inches thick, and 10 inches long, and dowelled together endways, leaving a space 4 inches wide between each line of wood blocks: fill up between these rows, from lime concrete foundation, with Portland cement concrete 8 inches high, and on the top of that lay 2 inches deep of asphalte: strew over the whole small shingle. This last should be renewed now and then. The wood blocks to be impregnated with creosote, to make them impervious to water; the cross joints of wood blocks to be broken half-way of length of block each alternate row of blocks. The Portland cement concrete swells as it sets, and the asphalte, when the shingle works into it and the wood, increases both, and presses all firmly together.—S. P. H.

Highfield Adjustable Circular-Saw.—This invention consists in securing a circular-saw to its spindle in an oblique direction, so as to make a saw of the common construction to cut grooves or rebates of any required widths. Between the saw and the collar on the spindle are two bevilled washers, each capable of being turned round independently of the other; and on the opposite side is a plain washer, having a concave recess for receiving a convex nut, which screws on to the end of the spindle and secures the saw firmly thereto. The whole is so arranged that by changing the relative positions of the two bevilled washers, a surface more or less oblique with the axis of the spindle is presented for the saw to be screwed against. Thus the obliquity of the saw with the axis of the spindle may be varied at pleasure, and grooves or rebates of various widths cut into the wood submitted to its action.

Manufacture of Bar-iron.—Mr. W. Clay, of Liverpool, has patented a process relating to the employment of rolling pressure for the conversion of bar-iron of various sectional figures, as, for example, plain, straight, square bars, or bars of angle iron, or T or channel grooved or trough iron, into taper bars, the object being to impart to bars of iron so made different strengths or powers of resistance at different points. The invention also relates to the adaptation of rolling pressure to the formation of bars, with sudden as well as gradual irregularities of depth or thickness, by which means it is proposed to form projections, protuberances, or indentations on or in the bars at different points, according to the particular purposes for which the iron may be required.

Credence Table.—A writer in *Notes and Queries* says,—"I saw it stated in one of our quarterly periodicals in 1852, that 'credence table' was derived from an obsolete German verb, *Kredenzen*, to taste, owing to the elements being placed on the credence table with a view to their being publicly tasted (before consecration) by a person appointed for that purpose, whenever the monarch was about to communicate, lest poison intended to destroy the monarch should be mixed with the bread or wine."

Trinity High-Water Mark.—In reply to "An Old Subscriber," of the 5th ult. I beg to state, 1st. Trinity high-water mark is placed in various parts of London, as described in the "Register of Tides in the River Thames," printed by order of the Honourable Court of Commissioners, of the 26th of October, 1849, and every bench-mark in London is shown in feet and decimals of feet above an oblate spheroidal datum plane, decreasing in radii towards the north pole from the centre of gravity between the parallels of latitude at London and Liverpool, about 2·02 feet, or 24¼ inches, which is evidently worthy of consideration, at a rate of 2 feet to the mile in 40 miles of sewer. 2nd. The difference at Liverpool is also given in the aforesaid report; and this may prove of public utility if reported on by the engineer employed in the levelling of the main drainage of London. The Ravensbourne drainage is a specimen of such levelling. 3rd. The information concerning the old dock-sill at Liverpool is in the possession of Mr. Newlands, borough engineer, of Liverpool. 4th. The approximate mean water at Liverpool is 12½ feet below the level of Trinity high-water at London, as described identical with the level of the datum plane of the Ordnance survey of London, which is also 12½ feet below the level of Trinity high-water mark. And all the information required is given in the aforesaid report, and has been published through the medium of the *Builder* in 1849, pp. 458 and 586. I agree with your subscriber in the desirability of a clear understanding, and it may not be improper here to observe that, where the medium of gravitation is resorted to as the agency to effect the grand object in draining London, the difference of altitude of the mean tide at the equator and the north pole is 22 miles, and in the same ratio of an oblate spheroidal figure between the parallels of latitude of the extremities of any sewer, &c. James M'Cleary.

Building Notes—Edinburgh.—The Dean of Guild Court have objected to the new plans for the Life Association's Offices in Princes-street, and operations have again come to a perfect stand-still. The last architect whose plans have been approved of by the Association was Sir Charles Barry. No fewer than three architects have been engaged on the plans, and their different designs have each been received, tried, and found wanting. A projecting cornice in the last plans, which would be prejudicial to the appearance of the adjacent buildings, has raised the opposition of the members of the New Club, who have accordingly determined to do everything they can to prevent the erection of the intended building. It has also been objected that it was proposed to raise the building six stories high, three being in entresol. This runs contrary to the regulation that no house should be more than five stories high. Operations have been recommenced for the completion of Melbourne-place. The corner adjoining Victoria-terrace will be entirely built, and will finish the original plan of the Improvement Commissioners in this part. We are not sorry to find that, after so many years of inactivity, the half-built appearance of George the Fourth Bridge may now be partially removed. The erection of Dr. Alexander's church, and the probable enlargement of the County Buildings, together with the present operations, will go far to assist in this desired object, and may perhaps induce other parties to come forward and purchase some of the vacant building stances. The new buildings are, as before, by George Smith, architect—Mr. Steven being builder and proprietor—and will be of the same Elizabethan character as the other part of the street. In digging the foundation, the builders have come on some of the old walls and cellars of the closes which formerly occupied this spot, and which had been built over in the direction of the bridge.—*Building Chronicle.*

Dust in Railway Travelling.—The New York Central Railway directors have nearly completed arrangements intended to obviate the inconvenience occasioned by dust in transit. The plan is simply to box in the running gear down to within two or three inches of the rail, and to extend tarpaulins over the open space between each car. Advantage is also gained in deadening the sound of the wheels.

"The Royal Gallery of Art."—No. XVIII. of "The Royal Gallery of Art" (Colnaghi and Co.) the last published, contains, "Charity," by Van Eycken, very well engraved by Lightfoot; "The River Bank," by Vander Heyde; and F. Mieris's "Teasing the Pet," engraved by R. C. Bell. The last is not a very excellent specimen of the master, but his works are rare. The previous part contained, amongst others, "The Scene from Midas," by Maclise.

27 and 28, Bishopsgate-street, Aug. 1st, 1856.

Gentlemen,—After twelve years' experience of your Patent Iron Revolving Shutters, I have much pleasure in testifying to their great superiority over all others; and if I were to put in a new front to-morrow, I should most decidedly give them the preference.

I am, Gentlemen, yours, &c.

Robert Alex. Rooney.

Messrs. Clark and Co. 15, Gate-street, Lincoln's-inn-fields, Engineers.

HALL has received instructions from the Contractors to SELL by PUBLIC AUCTION, on the PREMISES, Park-place, Eastcheap, Walworth, on TUESDAY and WEDNESDAY, AUGUST 19 and 20, at TWELVE precisely, the ground being cleared for build ng purposes, the whole of the STOCK and MATERIALS of a BUILDER and CONTRACTOR, comprising timber in sticks, banks, deals, battens, planks, joists, floor, feather-edge boards, lining and other boards, rafters, and scantling; the materials of several large temporary buildings, comprising the Royal Surrey Zoological Gardens, built of the best materials, comprising several thousand feet of yellow deal posts, plates, rafters, planks, floor, feather-edged, lining, and other boards, six, four, and two panel doors, made in sashes and frames, panelled and glazed partitions, wrought and moulded skirtings, cupboard fronts, screens, gardon rails, nash and cyclinder rails and forms, stoves, copper, range, registers in various sizes, cement and plaster in casks, sheet zinc, & c.; stock of bricks, Portland and other stone in blocks, slabs, landings, coping, string, pitchers, and pebble paving, 100 feet of York and Purbeck pavers, steps, kit hen sinks, &c. &c. of firewood, and a vast accumulation of various materials, all useful to persons repairing and building. On view two days prior and mornings of sale, and catalogues had of F. R. Easton, Esq., Architect, 21, Northumberland-street, Strand; at the Gloucester Arms, Stamford-street; on the Premises; at Garraway's; and of the Auctioneer, 41, Charing-cross.

CLERK of the WORKS WANTED.—The Burial Board of the Parish of Eastbourne require a Clerk of the Works, to superintend the erection of the chapels on the new burial ground, which will probably be finished in about three months.—Applications in writing, stating the terms and the time which would be devoted, accompanied by testimonials to be sent to Mr. J. H. CAMPION OGLE, Clerk to the Burial Board, Eastbourne, on or before THURSDAY next, the 21st AUGUST instant.

LOCAL BOARD of HEALTH for the BOROUGH of BRADFORD.—To SURVEYORS and OTHERS WANTED, in the Office of the Surveyor and Waterworks Manager of this borough, a competent person as CHIEF CLERK and ASSISTANT. He must be capable of taking levels, and must be a neat and expeditious draughtsman. A person having had experience of the method of conducting business in the Surveyor's Department under a Local Board of Health, and possessing a knowledge of the most approved methods of drainage, will be preferred. He will be required to devote himself exclusively to the duties of the appointment. Salary 120*l.* per annum. Applicants may be forwarded, stating age and previous occupation, to be addressed to the undersigned, on or before the 6th of AUGUST instant.—By order,

W. H. HUDSON, Town Clerk.

Bradford, Yorkshire, August, 1856.

A SURVEYOR WANTED.—The Local Board of Health for the District of "Waterloo with Seaforth," near Liverpool, wish to ENGAGE a PERSON to undertake the duties of SURVEYOR, as required by the provisions of the Public Health Act, 1848, and the Local Board's by laws regulating the duties and conduct of that officer. He will also be required to undertake the duties of Inspector of Nuisances, as imposed by the above Act and By-laws.—Applications for such office, stating the salary and terms upon which the aforesaid duties would be undertaken, accompanied by satisfactory references and testimonials of qualification, must be addressed, under seal, to the Chairman of the said Local Board, and sent to the Office of Mr. MASON, Solicitor, 30, Castle-street, Liverpool, on or before the 21st day of AUGUST instant, when and where at the usual hour will be given any further information and particulars required.—By order,

JOSH. MASON, Clerk to the said Local Board.

A YOUTH WANTED, in the TIMBER TRADE, who understands book-keeping, reducing deals &c.—State full particulars, per post, to B. H. 5, Gwynne's-place, Hackney-road.

TO JOINERS

WANTED, immediately, several GOOD WORKMEN. To steady men constant employment will be given.—Apply to Mr. JOHN WELLSPRING, Builder, Dorchester, Dorset.

WANTED, in a Surveyor's Office, a WRITING CLERK. It is essential that he should write well and quickly, and that he should be able to print plans with the greatest neatness.—Specimens of handwriting to be sent to G. P. at Messrs. Warr's, 61, High Holborn.

TO BUILDERS' CLERKS AND ACCOUNTANTS.

WANTED, a PERSON, competent to Measure, Price, and Make up the BOOKS of a CARPENTER and BUILDER, deceased. Apply, by letter only, post paid, to A. Z. 6, Hanover-place, Regent's-park, stating terms and where last employed.

WANTED, a thorough BUILDER'S FOREMAN. He must be active and competent to carry on extensive works with energy and accuracy; none other need apply. Apply at 34, Osnaburg-street, New-road, from EIGHT to NINE a.m. or SIX to SEVEN p.m.

WANTED, by the Son of a Builder in the Country, a SITUATION as CLERK of WORKS or otherwise, under a Builder. Is thoroughly acquainted with the business.—Address, T. Mr. G. Williams, No. 76, Stanley-street, Pimlico.

TO MASTER PAINTERS, PLUMBERS, BUILDERS, &c.

WANTED, by a respectable Young Man that perfectly understands his business, a SITUATION as PLUMBER, PAINTER, and GLAZIER, &c.—Can have good reference from his last situation. Letters addressed to X. Y. Z. at Mr. Howe's, Plumber, Church-street, Stoke Newington.

TO BUILDERS.

WANTED, by a practical Man, a RE-ENGAGEMENT, to superintend the execution of buildings, &c. Good references can be given. Locality no object. Apply to J. H. 211, Upper White cross street, City.

TO MASTER MASONS, &c.

WANTED, by a steady MAN, a SITUATION, as a MASON and LETTER-CUTTER. Has had sixteen years' experience as a letter-cutter and setter, on stone, marble, &c. both in plain and ornamental writing, and would be willing to make himself useful in any department of the business, to the interest of his employer. Understands drawing and colouring.—Address, A. B. Mason, care of Mr. Bonny, Crown Inn, Reigate, Surrey.

WANTED, a SITUATION as General or Shop FOREMAN, with good reference. Age 33. Address, J. H. B. 34, Upper Ebury-street, Eaton-square.

TO ARCHITECTS AND SURVEYORS

WANTED, a SITUATION, by a Young Man who is a neat Draughtsman and quick Accountant; well acquainted with measuring and estimating; also land surveying, leveling, mapping, &c. Good reference can be obtained from late employers. Salary not so much an object as a permanent situation.—Address, A. Z. Office of "The Builder."

WANTED, a SITUATION as CLERK of WORKS. Is a good draughtsman, and competent to prepare working drawings; is well experienced in all the branches of building, and has first-rate testimonials from gentlemen for whom he has executed numerous extensive works.—Address, X. C. 3, Bloomsbury-terrace, Vauxhall-road, Pimlico.

WANTED, a permanent SITUATION, by a first-rate GRAINER and MARBLER.—Address, post paid, B. H. N. Office of "The Builder."

TO CARPENTERS, BUILDERS, &c.

WANTED, by a Young Man that has been used to the general work of a shop, a permanent SITUATION.—Address, W. L. 14, James-street, Devonport-street, Commercial-road East.

WANTED, a SITUATION as ENGINE-DRIVER; a competent, steady, sober Young Man, of good character and recommendations.—Address, T. B. S. 8, Thornhill-street, Caledonian road, Islington.

TO PLUMBERS, BUILDERS, &c.

WANTED, a permanent SITUATION, by a Young Man, aged 28, as PLUMB R, PAINTER, and GLAZIER. Good references.—Address, T. B. 18, Chandos-street, Covent-garden.

WANTED, an ENGAGEMENT as GENERAL FOREMAN or CLERK of WORKS, by an experienced Man, who has had the superintendence of very extensive fire-prf. buildings.—Ample testimonials as to ability, sobriety, and attention to business can be had, if required.—Address, P. Q. R. Office of "The Builder."

TO ARCHITECTS, ENGINEERS, AND OTHERS.

WANTED, an ENGAGEMENT with an Architect or others. The Advertiser has a knowledge of architectural drawing, and is anxious to obtain a situation in an office in which he would have opportunities of improvement. Salary not an object. Address, X. Y. Z. 16, New-road, Hammersmith.

TO ARCHITECTS, ENGINEERS, AND OTHERS

WANTED, an ENGAGEMENT with an Architect or others, as Draughtsman and General Assistant. The Advertiser is a first-rate draughtsman and colourist, and familiar with office practice. Satisfactory references given. Address, X. Y. Z. Post-office, Starch-green, near London

TO BUILDERS, SURVEYORS, AND OTHERS

WANTED, by a respectable Young Man, a SITUATION as PLUMBER, PAINTER, and LEAD GLAZIER, &c. He has well experienced in the above business having carried out jobs of large extent. Address, H. A. 11, Georgecourt, Piccadilly

WANTED, by a Young Man (recently from the country), a SITUATION, in a good Builder's Shop, either as BENCHMAN, or otherwise. Address stating terms, A. B. 38, Warren-street, Islington.—Unexceptionable testimonials if required.

TO ENGINEERS OR ENGINEERING CONTRACTORS

THE Advertiser, who has had seventeen years' experience on general works, wishes to meet with an ENGAGEMENT. Is a good draughtsman, and well acquainted with measuring works, taking out quantities, leveling, &c. &c. First-rate testimonials. No objection to go abroad.—Address, A. G. W. Office of "The Builder."

TO ARCHITECTS AND SURVEYORS.

THE Advertiser, having been nearly eight years in the profession, is desirous of a RE-ENGAGEMENT. He is capable of making designs, together with finished and working drawings, estimating, conducted with the general business of an architectural surveyor's office, including land surveying, and can be well recommended. Would not object to be engaged as clerk of the works.—Address, A. B. to be left at the Lodge, Crosby Hall Chambers, Bishopsgate-street.

TO ARCHITECTS.

THE Advertiser is desirous of an ENGAGEMENT as ASSISTANT, to a London architect. He has been accustomed to prepare finished, working, and detailed drawings, and has had experience in measuring and superintending works.—Address A. G. W. 15, Lower Eaton-street, Pimlico.

TO TIMBER MERCHANTS, BUILDERS, AND SAW-MILL PROPRIETORS.

THE Advertiser desires EMPLOYMENT in either of the above trades. He has been engaged for several years in extensive building operations, and has a complete familiarity with the timber trade and markets, as well as the management of large saw-mill works, and the general conversion of wood. He is also a good accountant. To any person having a suitable opening his services would be found valuable.—Address, A. B. Messrs. Worsam and Co.'s, Saw-Mill Manufacturers, King's-road, Chelsea.

TO PLASTERERS AND BUILDERS.

EMPLOYMENT is WANTED by a Young Man from the country, who has had good practice in the Plastering Trade.—Address, A. B. at No. 20, William-street, Regent's-park.

BUILDER'S CLERK.—WANTED, EMPLOYMENT, by a Young Man, aged 21, of five years' good experience in a builder's office.—Address, W. H. care of Mr. Perry, Estate Agent, Malvern-street, Belgrave-square.

TO BUILDERS, PAINTERS, AND GRAINERS

A YOUNG MAN, a Painter and Grainer, wants a CONSTANT SITUATION. Wages, 27*s.* per week. Apply to J. W. Office of "The Builder."

TO ARCHITECTS, SURVEYORS, OR BUILDERS.

A GENTLEMAN wishes to ENGAGE with a respectable firm, where he will be fully employed. He has had eight years' experience, and has no objection to the country.—Address, QUERY, 13, Church-street, Chelsea.

TO CARPENTERS AND BUILDERS.

A YOUNG MAN, 21 years of age, wishes for a SITUATION as IMPROVER. He has been brought up principally in the cabinet line. Address, post-paid, F. C. 24, Belvidere-road, Lambeth.

TO BUILDERS AND CONTRACTORS.

A MEASURER, ESTIMATOR, and QUANTITY SURVEYOR, of great practical experience, offers temporary ASSISTANCE to BUILDERS; is also a good draughtsman. Terms reasonable (no charge if unsuccessful).—Address, Mr. WILLIAMS, Office of "The Builder."

TO BUILDERS, &c.

AN ASSISTANT, of much experience in all matters relating to building, desires an ENGAGEMENT in an Office, to make plans, take out quantities, make est mates, attend to the books, and measuring up of works, &c. Good references. Salary moderate. Address, R. S. 12, Parkstreet, Camden-town

A YOUNG MAN, of good general experience in the profession, is desirous of meeting with a Gentleman or Employer requiring the services of a perseving and trustworthy person, in any department connected with building operations. The superintendence of an estate, or general management of an office, would be suitable. Address, L. H. Mr. Kirkey's, 118, Whitech pel-road.

TO COUNTRY BUILDERS AND OTHERS

A SHOP or GENERAL FOREMAN.—An experienced Man, who wishes to leave London on account of the ill-health of family, wishes to meet with a SITUATION in the country, where he can go to a country job. Satisfactory testimonials as to ability, sobriety, &c. can be given. Salary very moderate.—Address, CARPENTER, Office of "The Builder."

TO BUILDERS AND CONTRACTORS.

AN experienced BUILDERS' CLERK wishes for a RE-ENGAGEMENT. Most respectable references and testimonials can be given.—Apply to W. S. care of Mr. Hills, 12, John-street, Old Ipbi

TO BUILDERS AND OTHERS.

A THOROUGH PRACTICAL BUILDER'S FOREMAN, acquainted with the trade in all its branches, is open to a RE-ENGAGEMENT. Address, Mr. WRIGHT, Sutherland-place, Bilston-road, Wolverhampton.

TO ARCHITECTS, BUILDERS, AND CONTRACTORS.

AN experienced, practical, energetic person, well versed in construction and Gothic details, is a good draughtsman, can measure, &c. requires a SITUATION as CLERK of WORKS, or General or Shop Foreman. No objection to a country town, or to go abroad.—Address, ALPHA, 41, Robert-street, Hoxton.

N.B.—Unexceptional testimonials.

TO ARCHITECTS

A PRACTICAL CLERK of WORKS, having just completed a large public work, wishes a RE-ENGAGEMENT. Address, C. J. 3, Wenlock-street, New North-road.

A PLASTERER, acquainted with all the branches and materials, requires a JOB at PIECE WORK in town or country. Good references.—Address, X. Z. Office of "The Builder."

TO CARPENTERS AND BUILDERS.

A RESPECTABLE YOUNG MAN, aged 28, wishes for CONSTANT EMPLOYMENT in the above line; would be of service to any small builder, being capable of measuring. The Advertiser has also an opening for a well-educated industrious youth, as an ARTICLED PUPIL. From one about 15*l.* guinea.—Address, C. E. 12a, Great George-street, Westminster.

A SITUATION WANTED by a first-rate PLUMBER, who is capable of taking charge of work or any place where confidence is required. Good reference if desired.—Apply to A. B. C. Mr. Larking, No. 2, High-street, Maidstone, Kent.

GEO. & THOS. EARLE, CEMENT MANUFACTURERS, HULL.—Light, Dark, and Portland Cements equal to any made. Manufacturers also, and Dealers in Plaster, Paris White, Mastic, Hair, Lias Lime, Laths, Slates, and Slate Slabs, Fire-bricks, Grindstones, Cement Chimney-tops, ditto Vases, Ridging, &c. Paints, Stucco, &c. Marble Merchants and Importers of Portzolano.

11 George-yard, Lombard-street, City.

ELMLEY CEMENT WORKS.—ROMAN and PORTLAND CEMENT of the first quality, manufactured on the above works. Also STOCK and KILN-BURNT BRICKS, hand moulded and machine made, for shipment or otherwise.—Apply to G. BOOTH, Agent, as above.

KEENE'S and PARIAN CEMENTS and FRENCH PLASTER, for internal uses. These well-known hard Stuccoes dry quickly, and can be painted upon within a few days.—Made and sold by JOHN BAZLEY WHITE and BROTHERS, Millbank-street Westminster.

ATKINSON'S CEMENT, so long known and esteemed in London for plastering purposes, is a quick-setting Cement, that requires no colouring.—Sold exclusively by JOHN BAZLEY WHITE and BROTHERS, Millbank-street, Westminster; and Seel street, Liverpool.

ARTIFICIAL HYDRAULIC or PORTLAND CEMENT combines the valuable qualities of the natural Cements with the additional advantage that it greatly excels them in its cementitious properties; that it is not effected by frost, and does not vegetate in damp situations. Account of COMPARATIVE EXPERIMENTS on the strength of this and other Cements read at the Institute of Civil Engineers, to be obtained from the Makers, JOHN BAZLEY WHITE, and BROTHERS, Millbank-street, Westminster, who prepare one quality only of Portland Cement.

BATH, PORTLAND, and ROMAN CEMENTS. The London and West of England Cement Company can offer to the Trade the best natural HYDRAULIC CEMENTS at reduced prices. The Company particularly recommend the best quality of their Bath Cement for all modelling cornices, decorations, &c as having all the qualities requisite for an interior cement, and being quite unaffected by extremes of weather. The Company also supply BLUE LIAS LIME, lump and ground, which will carry more sand than any in the market.—Communications to be addressed to the General Offices, 20, Old Broad-street, London; to Mr. MONUMENT, 4, Caroline-place, City-road; to Mr. TIMEWELL, the Depôt, 9, North Wharf-road, Paddington, or to the Works, Dunball Bridgewater.

SOUTHAM BLUE LIAS LIME DEPOT.
Glazed Stoneware Sewage Pipes.
Brick, Lime, and Cement Merchants,
TATHAM and CO.
14, South Wharf, Paddington.

PARIAN CEMENT, reduced in price 25 per cent. This article is valuable for inside stucco, and especially for skirtings, for flooring on brick arches, &c. It takes paint in a few hours after its application on walls or laths, is without efflorescence, and may be covered in a cycle of days. A finer quality, if rose a beautiful Scagliola, with any admixture of colours.—Manufactured by FRANCIS, BROTHERS, Cement Works, Nine-elms, London.

CEMENT.—ROMAN and PORTLAND CEMENTS, and PLASTER of PARIS, manufactured by C. J. HILTON, can be had in any quantity, wholesale and retail at his wharf, 8, Upper Thames street, London; and also at the manufactory, Faversham, Kent. N.B. These Cements supplied for shipment, on advantageous terms.

JOHNS and CO.'s PATENT PERMANENT STUCCO WASH (perfectly non-absorbent). STUCCO, CEMENT, STUCCO PAINT.—CLARK and BENGOUGH, Manufacturers, Grand Surrey Canal Bridge, Old Kent-road. Office, 4, George-yard, Lombard-street.

PORTLAND CEMENT.—JAMES WESTON having enlarged that portion of his CEMENT WORKS on Millwall, Isle of Dogs, for the manufacture of Portland CEMENT, begs to inform the Trade in general that they can be supplied with any quantity they may require, either at his Works, St. Andrew's Wharf, Millwall, Blackfriars, or Middle Wharf, Scotland-yard, Westminster. Manufacturer of Roman, Lias, and Mastic Cements, English and French Plaster, &c

PORTLAND and ROMAN CEMENT.
PLASTER of PARIS
Manufactured by J. M. BLASHFIELD, at Millwall Isle of Dogs. Warehouse, No. 1, Wharf, Paddington-basin

THE PORTLAND CEMENT WORKS, NORTHFLEET, KENT.—Messrs ROBINS and Co. to WHOM THE PRIZE MEDAL WAS AWARDED in 1851, are prepared to supply any quantity of the very best PORTLAND CEMENT, manufactured by them for all the purposes to which Cement is applicable. Orders received at Great Scotland-yard and at the Works.

PORTLAND CEMENT WORKS, NORTHFLEET, Kent.—KNIGHT, BEVAN, and STURGE, Manufacturers only of first class quality, for the home and foreign trade. Portland Cement is manufactured at these works with especial reference to its destination, whether for stuccoing, brickwork, blocks for breakwaters, tidal work, or otherwise.—London Wharf, Belvedere-road, Lambeth.

PORTLAND and ROMAN CEMENTS.—T. H. BOORMAN, WILD, and Co. MEDWAY LIME and CEMENT WORKS, LOWER HALLING, near Rochester. Agent at the Works—Mr. THOMAS WEEKS.
Accents in London, Messrs. GEORGE PUTTER and CO., Limemerchants, Purfleet-wharf, Earl street, Blackfriars, and No. 19, North-wharf-road, Paddington.

PORTLAND and BATH CEMENTS.
TATHAM and CO.
14, South Wharf, Paddington.

PORTLAND and BATH CEMENT.—FULLWOOD THOMPSON and CO. request the attention of Merchants and Contractors to the quality of their Portland and Bath Cement, which they manufacture on an improved system, securing regularity of strength and colour, and at a less cost than is attainable by most other makers.
These cements set under water in a few minutes, and are not affected by extreme heat or cold.
FULLWOOD THOMPSON & CO. will be happy to send prices and samples in reply to application by post. They deliver free into the Basil and Exeter Railway Company's trucks at their works, or free on board in the Port of Bridgewater.

BLUE LIAS LIME.—CHAS. NELSON begs to offer to consumers a supply of Blue Lias Lime direct from his quarries in Warwickshire, the quality of which has been tested by several of the largest building firms in the metropolis and approved by them; and those who have favoured C. N. with their patronage during the last three years have always expressed themselves satisfied with his system of weighing or measuring the lime. When the lime is delivered by boat, the master has instructions to produce on demand the canal cauger's pass, by which the purchaser may know the exact weight delivered.—Orders addressed to the London Depôt, 18, South Wharf, Paddington, J. D. BLYTH, Sole Agent, will have immediate attention.—Quarries and Manufactories, Stockton, near Southam, Warwickshire.

HUBBUCK'S WHITE BODY PAINT of superior body to the Best White Lead, whilst it is as smooth and permanent as Zinc Paint. One coat laid on as directed is equal to two coats of White Lead, whilst consumption of material is less than for one coat. It dries very fast and hard.
HUBBUCK'S STONE COLOUR PAINT is the same as the former, at three fourths the price.
HUBBUCK'S PATENT WHITE ZINC PAINT is invaluable for iron ships and iron exposed to salt water; neither bilge water, nor noxious vapours from cargo, nor heat on funnels of Steam Vessels act upon it. Sold by the Wholesale Paint Dealers, in original packages, sham'ed, Brunswick, London. Patent; and when so marked the quality is guaranteed
HUBBUCK'S COPPER COLOUR ENAMEL PAINT prepared expressly for the bottoms of Iron and Wood Steam Ships, a preventation from rust and incrustation. Timber coated with this Enamel is not attacked by the worm neither do barnacles attach to it.
Full particulars of THOMAS HUBBUCK and SON, Paint and Varnish Works, opposite the London Docks, London.
OLD ZINC AND ZINC CUTTINGS BOUGHT TO ANY EXTENT.

CHARLES RICHARDSON,
3 & 6, SOUTH-WHARF, PADDINGTON BASIN.
COWLEY AND KENT BRICKS,
PORTLAND, ROMAN, AND OTHER CEMENTS,
TAMWORTH GLAZED SEWAGE PIPES
BLUE VITRIFIED BRICKS COPINGS, PIPES, &c

3 & 6 South Wharf, Paddington.

NOTICE.
CHARLES RICHARDSON takes the earliest opportunity of informing Engineers, Architects, Contractors, and others, that he is now bringing GREAVES'S BLUE LIAS LIME per the Great Western Railway from Harbury to Bull's-bridge and Paddington, from whence it can be delivered alongside any part of the river Thames, canals, or railway stations in London the day after it is burnt and ground, in any quantity, and at a great reduction in price.
All applications for prices and terms will meet with prompt attention
N.B. Please observe the lime is ground at the works, not in London.

GREY STONE LIME WHARFS,
12, UPPER GROUND-STREET, Blackfriars (Surrey side),
7, NORTH WHARF-ROAD, Paddington.
WILLIAM PETERS begs to inform the trade he is in a position to supply the best GREY STONE LIME to any quantities from the above wharfs, or per barge direct from the kilns.
Large Grey Stone, or Grey Chalk, free on board at Works, 8/6d per ton
Small ditto, ditto, 6d. per ton
Barges loaded in a few minutes.
Woulbam-hall Grey Stone Lime Works, on the Medway, near Rochester

NOTICE.
SOUTHAM HYDRAULIC BLUE LIAS LIME.
WILLIAM OLDHAM begs to inform those parties requiring genuine Hydraulic Blue Lias Lime, that he is prepared to deliver the best quality of ground and lump lime, at the Works.—Address, WILLIAM OLDHAM, Blue Lias Lime and Cement Works, Southam

BLUE LIAS LIME.—Messrs. GREAVES and KIRSHAW having completed their Works on the Birmingham and Oxford Line of the Great Western Railway, at Harbury, are now prepared to supply LUMP and GROUND LIME of the best quality, direct from the kilns, to all the Stations on the Great Western Railway.—Greaves's Blue Lias Lime Portland, Bath and Lias Cement.—Works, at Harbury, Stockton, and Wilmcote.—Office, at Warwick

GREY and CHALK LIME.—W. T. ALLUM and Co.'s Lime from the firm of Thos. Green and Co.'s Grey and Chalk Lime Burners on the Medway. Agents for the Woulbam Patent Portland Cement, and Dealers in Roman Cement, Plaster of Paris, &c. &c. Wharf and Office road

THE PATENT BRICK MACHINE COMPANY invite orders for their IMPROVED MACHINES. One of them is working in a field at Caterham, near Croydon, and arrangements are made with the owner for bearers of a letter from the Secretary, to see it in operation every Thursday and Friday. It is the most simple machine invented. Trains from London-bridge to Warlingham close to the field, leave at 6 and 9.30 a.m. and 3 p.m.; return at 9.35 a.m. and 5.6 and 7.55 p.m.
HENRY C. MOUNT, Sec.
37, King William-street, City.

TO BRICKMAKERS, BALLAST BURNERS, and OTHERS.—GAS BREEZE, of superior quality, TO BE SOLD, in large or small quantities, on the Regent's Canal. Apply to RANDELL and EVANS, Ide Works, Maiden-lane, King's cross.

BEADON'S EAVES GUTTER TILES.—Mr. LAWES is prepared to CONTRACT for the ERECTION of the above TILES on roofs of all descriptions, in the neighbourhood of London at 7d. per foot; above 100 feet, 6d.—Office, 1, Adelaide place, London-bridge.

BEADON'S PATENT IMPERISHABLE GUTTER-TILES,
For Spouting Roofs of Houses (either old or new, whether of thatch, slate, or tile), and other structures.
SOLE AGENT,
J. B. LAWES, 1, Adelaide-place, London-bridge.
This is the cheapest kind of spouting known; for, besides its lower cost, it will last without paint or repair as long as the building itself. It will bear the weight of any ladder; and in case of accident a labourer can repair it. It occupies the room of a large amount of roofing, affording a great saving in slates, tiles, &c. It is especially applicable to the backs of houses in town, cottages, and agricultural buildings.
Price 4d. each tile of about 13 inches long; stop-ends and outlets, 6d. Any mason can put them up, or if over 100 feet are required, a man will be sent to fix them at 5d. per foot. This charge to include tiles delivered in Agent's yard, cement, and labour. May be had in London, Gloster, Bridgwater, and Rugby.

MAW and CO.'S ENCAUSTIC TILE PAVEMENTS, form a highly decorative and durable substitute for ordinary floorings, and their enrichable oil cloth coverings, for entrance halls, porches, conservatories, verandahs, passages, &c. &c. Priced pattern-book forwarded, post-free, and without charge, accompanied by estimates, on application to MAW and CO. Benthall Works, Broseley, Salop.

MINTON and CO.'S ENCAUSTIC and other PATENT TILES, for Churches, Entrance Halls, Conservatories, Bakeries, &c.; Antique, Geometrical, and Alhambric Mosaics, manufactures of a highly decorative character, and extreme durability, Slabs and Tiles for Fireplaces and Hearths, Coverings for Grates, Door Furniture, White Glazed and Ornamental Tiles for Baths, Dairies, and Kitchen Ranges, may be had, in great variety at their Warehouse, 9, Albion-place, Blackfriars-bridge, London; and at their Manufactory, Stoke-upon-Trent, Staffordshire.

PEAKE'S TERRO-METALLIC TILES, PIPES, &c.—Notice is hereby most respectfully given, that the LONDON DEPOT for this WARE is REMOVED to No. 31, WHARF, Macclesfield-street North, City-road Basin. Secondly, that the trade term, "TERRO-METALLIC," is the exclusive right of the Proprietor; and, thirdly, that the "REWARD OF THE JURIES," page 581, of the Great Exhibition, rank the Manufactories known as long as "The Tileries." Tunstall, Staffordshire, as the first of the kind in the world.

PANTILES, PAVINGS, &c.—J. H. ANDREWS, Wisbeach, Cambridgeshire, begs to offer pantiles at 32s. 6d. per 1,000; 9 inch paving, 8 inch paving, at 57s. 6d. per 1,000; plain tiles, at 30s. per 1,000, delivered. Cash prices.—Delivered on trucks in London or Eastern Counties Railway.

H. and R. HAYWOOD, Brownhills Blue Metallic Tileries, near Burslem, Staffordshire; London Depôt, 15, South Wharf, Paddington. Manufacturers of Improved Plain and Ornamental Roofing, Ridge, and Flooring Tiles, for Churches, &c.; also Metallic Plain and Socket Sewerage Pipes, &c. adapted for sanitary and Railway purposes. They are extensively used on the London and North Western, Great Western, Trent Valley, North Staffordshire, and other Lines of Rail, and highly approved. Warranted imperishable, and to resist all acids and exhalations.
*** A FIRST-CLASS MEDAL was awarded to H. and R. HAYWOOD, by the Jury of the GREAT EXHIBITION.

A CLERK of WORKS, with the highest testimonials, is open to a RE-ENGAGEMENT.—Address, D. S. 2 Beaumont-street, Marylebone.

A GRAINER wishes for a permanent SITUATION. Specimens can be shown. He will fill up his time with Painting, &c. Country preferred.—Address, B. Office of "The Builder."

FREEHOLD LAND TO BE LET, on Building Lease for ninety-nine years. Money advanced to responsible parties. Freehold Land to be Sold for building purposes in eligible situations.—Apply at the Offices of Messrs. MORGAN and PHIPSON, Architects, 3, Danes-Inn, St. Clement's, Strand.

FREEHOLD LAND.—A few ACRES WANTED, on Lease for about 80 years, for the erection of a small rural residence. Distance from London not to exceed 15 miles, and near a Station.—Direct, stating rent per annum, and situation, with order to view, to O. P. the Housekeeper, 50, King-street, Chepside.

FREEHOLD BUILDING LAND TO BE SOLD. A very eligible Plot for the erection of about Sixty Houses, which fronts to three roads, and has four frontages. The sewers are already built, and the neighbourhood is far advanced. Inquire of X. Y. care of Mr. Baker, Ironmonger, Camden-town.

FREEHOLD BUILDING GROUND TO BE LET or SOLD, on advantageous terms, two plots of ground, situate in the most preferable part of St. John's-wood.—For particulars apply the letter, post-paid, to W. LEWIS, 2, Craven-terrace, Craven-hill, Paddington.

FREEHOLD BUILDING LAND at Norwood, Anerley-grove, and Palace-road Estates.—TO BE LET, or SOLD, eligible BUILDING SITES, in close proximity with the Crystal Palace and its railways.—At Hackney, within three minutes' walk of the Victoria-park station for ninety-five years at FORTY PLOTS, at ground-rents from 18s. per plot per annum upwards, being nearly equal to freehold. Roads and sewers on all the estates complete, and liberal advances to respectable builders.—Apply to Mr. JAS. BRAGG, Devonshire Villa, Rotherhithe; at No. 96 Star-street, Edgware-road; and Vale Cottage, Anerley, near the land opposite the Crystal Palace Railway station.

N.B.—A Plot of Freehold Land, in an eligible situation, with about 3,000 feet of building frontage, to be Let for 100 years, at one shilling per foot per annum, nearly 200 feet deep, with privilege of purchasing the freehold.

HAMPTON-COURT.—About EIGHT ACRES of BUILDING GROUND TO BE LET, on Ninety-nine Years' Lease, or SOLD, in small or large Plots, near the above palace and railway, at moderate rents and prices. An advance of say 30 per cent. on the outlay would be made to respectable parties taking a considerable frontage. For terms, &c. apply to Mr F LETT, Architect, 36, Essex-street, Strand.

STRATFORD, ESSEX.—FREEHOLD LAND, within three miles of London, exonerated from land-tax and free of tithe, TO BE LET, on Lease, for a long term of years, in large or small plots, suitable for manufactories or building purposes.—Apply to Mr. W. H. DEAN, Auctioneer and Surveyor, Stratford; or to Mr. GEORGE POWNALL, Surveyor, 37, Bloomsbury-square, London.

NEW WINDSOR ESTATE.—Valuable BUILDING LAND TO BE LET, in Plots for first and second class Villa Residences, with Stabling, which are much needed in this beautiful locality. The situation is the finest in or near Windsor, abutting on the Park and Long Walk, and commanding a splendid view of the Castle. Within ten minutes of the Great Western and fifteen minutes' walk of the South-Western Railway Stations. Advances can be had by responsible parties. For particulars apply to Mr. WILLIAM SIM, Architect and Surveyor, 3, Danes-Inn, Strand.

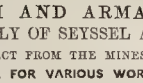
TO BUILDERS AND OTHERS.
CLAPHAM-COMMON.—TO BE SOLD or LET (with the option to purchase hereafter), FREEHOLD LAND in this very superior and delightful locality, in plots, suitable for the erection of villa and other first-class residences.—Apply by letter, post paid, to A. B. care of Mr. Evans, Stationer, &c. Clapham Old Town.

BUILDING LAND, in eligible situations. One lot is in Kentish-town, partly covered; the other is at a railway station, eight miles from town, where there is an excellent opening for a good Public-house and Stabling, at the Station-gate. And also for semi-detached VILLAS, TO LET, at about 30l. to 35l. per annum. Money could be had if required.—Apply to THOMAS NUNN and SONS, 21, Lamb's Conduit-street, Foundling Hospital.

FINCHLEY.—LAND fronting the Regent's Park-road, and East-end-road, TO BE LET on Building Leases for ninety-nine years, with power of enfranchisement. Plots from one to four acres for large villas residences; smaller plots for semi-detached houses, and plots for shops in the village. Apply to W. A. BOULNOIS, Esq. Architect, 5, Waterloo-place, Pall-mall; or to Messrs. BARKER, BOWKER, and PEAKE, 1, Grays-inn-square.

WANTED to PURCHASE, a BUILDING SITE or PREMISES in London, west of Temple-bar (either freehold or long leasehold), in or near a leading thoroughfare in a central situation, suitable for a charitable institution.—Letters (post paid), stating full particulars, to be addressed to Mr. E. GOULD, 8, Craig's-court, Charing-cross.

BUSINESS PREMISES.—Capital Manufacturing Premises TO BE LET, with or without House, suitable for a Carpenter, Builder, Cabinet or Pianoforte Maker, situate within three minutes' walk of Oxford-street and Regent-street. A valuable opportunity for any person commencing business in the Carpentering line, as a respectable tenant would be introduced to the customers of a gentleman retiring. Address to D. G. 14, Duke-street, Portland-place.



TO BUILDERS.—VILLA RESIDENCE, SOUTHPORT.—Persons desirous of TENDERING for the ERECTION of a VILLA in this neighbourhood, can inspect plans, specifications, and conditions of contract between the hours of TEN and FOUR o'clock), at the Office of Mr. RICHARD WRIGHT, Agent, Southport, to whom sealed TENDERS are to be delivered on or before SATURDAY, 23rd AUGUST. The advertiser does not bind himself to accept the lowest Tender.

WHARF and PREMISES.—TO BE LET (or the Lease to be Sold), a WHARF, on the Regent's-canal, near the Victoria-park, having a frontage of about 140 feet, with large shed (the upper part adapted for a granary), dwelling-house, and range of stabling.—Apply to Mr. ST. QUINTIN, Auctioneer, 36, Royal Exchange.

WHARFS and STORES in the Adelphi.—TO BE LET, for a term, or by the year, together or separately, TWO WHARFS, each having house, counting-house, stores, and stabling; one with dock space for fifteen barges and the other for twenty-five barges, and each with a dry-dock. Rent moderate. Possession immediate. Reference for further particulars to be made to Mr. C. PALMER, General Railway Office, 4, Gresham-street, City.

GENUINE SEYSSEL ASPHALTE.

A printed List of the important Works for Flooring, Roofing, Covering of Arches, &c. &c. executed from 1849 to 1852, with this Material, may be obtained at the Office of
ORSI AND ARMANI.
THEIR PATENT METALLIC LAVA IS FIFTEEN PER CENT. CHEAPER THAN THE GENUINE SEYSSEL ASPHALTE OF MESSRS. O. AND A.
OR THIRTY PER CENT. LOWER THAN ANY OTHER MATERIAL CALLED BITUMEN OR ASPHALTE
Offices, No. 6, Guildhall Chambers, Basinghall-street, City.

CHEAP AND DURABLE ROOFING.
By Her Majesty's  Royal Letters Patent.

F. McNEILL and CO. of LAMB'S-BUILDINGS, BUNHILL-ROW, LONDON, Manufacturers and only Patentees of
THE PATENT ASPHALTED FELT, FOR ROOFING HOUSES, VERANDAHS, SHEDS, &c.
Patronized by
HER MAJESTY'S WOODS AND FORESTS,
HER MAJESTY'S COMMISSION OF CUSTOMS,
HONOURABLE EAST-INDIA COMPANY,
HONOURABLE BOARD OF ORDNANCE,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANICAL GARDENS, REGENT'S PARK,
And by the most eminent members of the Royal Agricultural Societies of England, Scotland, and Ireland; at whose great national shows it has been exhibited, and OBTAINED THE PRIZE, for being the best and cheapest article for roofing; also used for under slates at the Royal Agricultural Society's House, in Hanover-square. Its advantages are lightness, warmth, durability, and economy it is impervious to rain, snow, and frost, and a non conductor of heat and sound. The Felt can be cut to any length, by 32 inches wide. The price is only ONE PENNY PER SQUARE FOOT. Samples, with full directions as to its uses and the manner of applying it, with TESTIMONIALS, some of them of seven years' experience, from Architects, Builders, Noblemen, and Gentlemen who have extensively used it, sent free to any part of the town or country. A Dry-hair Felt, for covering Boilers, &c. is also manufactured, by which a saving of about 25 per cent. in fuel is effected. The TRADE are respectfully enjoined to send their orders DIRECT to the FACTORY, as the surest means of being supplied with the genuine article, and in lengths best suited to their roofs. They are likewise CAUTIONED AGAINST MISREPRESENTATION, as THE ONLY WORKS in Great Britain where the above roofing is made are F. McNEILL and CO.'s Manufactories, LAMB'S-BUILDINGS, BUNHILL-ROW. Roofs covered with the Felt to be seen at the Factory, also the new Vice-Chancellor's Courts, the passages and offices leading to Westminster Hall, and other buildings at the New Houses of Parliament.—A Liberal Discount allowed to the Trade.

TO BE LET, or LEASE TO BE SOLD, very extensive PREMISES in Bermondsey, and within ten minutes' walk of London bridge, well adapted for a contractor or builder. They consist of a large yard, twelve-roomed house, including two offices, with garden in rear, joiners' shop for twenty to thirty benches, scaffolding for deals, &c. upwards of 200 feet long, two saw-pits, two large sheds, stabling for twenty horses, the whole containing nearly an acre of ground, and will be let at a very low rent.—Apply to ROBERT WARD and SON, Timber Merchants, 8, Oxford-street.

ONE HUNDRED ACRES of LAND, with good newly erected HOUSE, TO BE SOLD, one mile from Farnham, and three from Aldershott Camp. The house is on a dry soil, pleasantly situate in the centre of its own grounds, and contains drawing and dining rooms, five bedrooms, kitchen, washhouse and cellar, capacious out-offices, with man's room over, and convenient offices. The land is in a ring-fence, 40 acres of which are planted with fir-trees now of four years' growth, about 50 acres in cultivation, and the remainder in heath. Price, 2,500 guineas.—Apply to Mr. RUDGE, Estate Agent, Farnham.

BERKHAMPSTEAD.—FREEHOLD LAND.—TWELVE PLOTS for SALE, adapted for villas of moderate size; soil, situation, and aspect rarely equalled. A first-class railway ticket for twenty-one years is offered to persons building houses of a suitable character, and of the value of 50l. a year. The Free Grammar School also affords very great advantages to residents.—For a plan of the land and further particulars, apply to Mr. BALDWIN, High-street, Berkhampstead.

TO BUILDERS.—A BUSINESS TO BE SOLD, that has been established forty years, in a respectable neighbourhood, within 2½ miles from the bridges, on the Surrey side. Purchase-money, 150l. including scaffolding and other utensils. The owner is about to retire from business.—Apply to Mr. PARRY, 5, Dean's-row, Walworth-road.

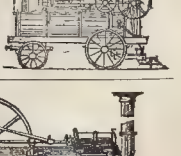
GRAINING by MACHINERY.—The present system of graining is far surpassed by the use of BELLAMY'S PATENT GRAINING MACHINES, by which an ordinary workman can produce first-class work, and at an immense saving of time. The designs are perfect imitations of the choicest specimens of fancy woods and patterns of the first artists. The Patent Graining Company are now prepared with a large and well-assorted stock of instruments, which they offer to grainers, painters, builders, and others without royalty.
Grained paper in imitation of all kinds of fancy woods of the choicest descriptions, in the piece, or in sets for panels, &c. wholesale and for exportation. Pattern-boards and cards for the trade in great variety.
Painters, Grainers, Decorators, Merchants, and others are respectfully invited to inspect the patterns, and see the process at the Company's Offices, 30, Minories, London.

WILLIAM GILBERT, Manufacturer of all kinds and colours of Tiles, Quarries, Drain-pipes, Moulded Bricks, Brackets, Vases, Chimney-pots, Stoneware Glazed Sewerage Pipes, Ornamental Quoin Blocks, &c.
Tividale, Staffordshire.

TO WATER COMPANIES AND PLUMBERS.
HIGH-PRESSURE COCKS & CLOSETS.

The Health of Towns Commissioners having recommended the adoption of the high-pressure principle in all towns, WARNER'S HIGH-PRESSURE COCK is recommended as a Cock free from leakage, and applicable for all purposes and situations. Patent Closets and Basins with supply-valve for attaching direct to main pipes without a cistern, cocks, or wire.
LEAD, IRON, and TIN PIPE.
JOHN WARNER and SONS, Manufacturers, 8, Crescent, Jewin-street, London.

R. RICHARDS and CO. PUMP MANUFACTURERS and ENGINEERS.
Pumps in Wrought and Cast Iron and Brass, bored by machinery, and fitted in the best possible manner, suitable for excavators, roads, brickmakers, farms, gardens, stables, liquid manure, ships, barges, well-sinking, &c. adapted for any depth. Hydraulic Pumps for deep wells.
PUMPS ON HIRE.
Pumps of any size, single or double barrel, up to double 12-in. diameter, kept ready for use at reduced prices.



N.B. The above can be worked either by hand, horse, or engine power.

Iron Pails 38s. per doz. painted.
Ditto .... 48s. per doz. galvanized.

Upper Ground-street, Blackfriars Bridge, Surrey Side.

TO BUILDERS AND PLUMBERS.
The attention of the Trade is called to JOHN WARNER & SONS' PATENT VIBRATING STANDARD PUMP, which is recommended for the simplicity of its construction, and the ease with which it works.
By the introduction of the vibrating standard, the cumbrous carriage and expensive slings and guides are unnecessary, rendering the prices considerably less than Pumps made on the old plan.
Beer and Water Engines for raising fluids from a depth not exceeding 28 feet; also, Garden Engines constructed on the same principle.
JOHN WARNER & SONS,
8, Crescent, Jewin-street, London,
Manufacturers and Patentees.

STEAM PUMPING ENGINES.—PATENT PORTABLE STEAM-ENGINES, from four to ten-horse power, always ready to let on hire, by the week or month, for pumping, sawing, pile-driving, raising materials, &c. &c.
Contracts taken for pumping any quantity of water.

JAMES BURTON & SONS,
Engineers and Contractors,
John's-place, Pentland-street, Southwark, London.

PORTABLE STEAM-ENGINES and PUMPS kept in Stock for Hire at reduced Prices. R. RICHARDS and CO. Pump Manufacturers and Engineers, Upper Ground-street, Blackfriars-bridge (Surrey Side).

CONTRACTORS' STEAM-ENGINES.—TO BE LET, on HIRE, or for SALE, several NEW and SECOND-HAND STEAM-ENGINES, of various powers, suitable for contractors' work generally.—Apply to Messrs. MEDWIN and HALL, Engineers, Surrey Iron Works, Blackfriars-road, where they may be seen.

TO ARCHITECTS, BUILDERS, CONTRACTORS, AND OTHER CONSUMERS OF GLASS.

HARTLEY'S PATENT ROUGH PLATE GLASS,

1-8th of an inch thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th or 4 lbs. is now universally used for

RIDGE AND FURROW ROOFS, GREENHOUSES, RAILWAY STATIONS, MILLS, MARKET HALLS, BATHS AND WASH-HOUSES, FACTORIES, WORKSHOPS, SHIP-BUILDING SHEDS, AND OTHER EXTENSIVE BUILDINGS.

By a carefully prepared Estimate, it has been ascertained that FOUR-FIFTHS of the ROUGH PLATE, or non-transparent Glass, consumed in the United Kingdom in 1854, was manufactured by HARTLEY'S PATENT—thus affording the most incontestable evidence of its superiority over every other article of the kind, and as being the only description of Glass suitable for the purposes above named. It combines size and strength with economy of cost, and is manufactured in sizes expressly for RIDGE and FURROW ROOFS, giving a SPAN of TWELVE FEET, at a price not exceeding, weight for weight, that of Common Crown Glass. Its non-transparency renders BLINDS UNNECESSARY, and no scorching occurs in Greenhouses glazed with it; hence the preference given to this Glass for all Horticultural purposes.

For further particulars, apply to

JAMES HARTLEY AND CO. SUNDERLAND; AND PURFLEET WHARF, EARL-STREET, BLACKFRIARS, LONDON.

Sole Maufacturers of Lockhead's Patent Perforated Glass for Ventilation.

*** *Hartley and Co.'s Glass Tariff Newspaper will be forwarded gratis, on application.*

FACING FOR BUILDINGS COMPANY—TAYLOR'S PATENT.

TO ARCHITECTS AND OTHERS WHO INTEND BUILDING.

BUILDINGS PERFECTLY RESISTANT TO WET WITHOUT ADDITIONAL EXPENSE, OR THE USE OF COMPO,

REQUIRING THE CONSTANT EXPENSE OF PAINTING. EXTERNAL WALLS FACED WITH AN INDESTRUCTIBLE MATERIAL. STONE-FACED BUILDINGS AT LITTLE MORE COST THAN CEMENT.

No necessity for Iron Cramps and Bond stones, and the Stone Ashlar never improperly weighted by the settlement of the Mortar Joints of the inside Brickwork. The INSIDE of CHURCHES and OTHER BUILDINGS FACED WITH STONE instead of Plastering. Also Dining halls, Lobbies, Staircases, &c. of Private Residences. It can be had ready for fixing from the quarries at a small cost for carriage, or prepared at home. Can be used with the ordinary Bricks of any locality, and by the ordinary workman. The CHURCH faced inside and outside in this manner, and the other Buildings at SPRING GROVE HOUNSLOW, and elsewhere, can be inspected, and full particulars obtained, of

Mr. JOHN TAYLOR, ARCHITECT, OFFICES OF THE COMPANY, 40, KING-STREET, CORNER OF CHEAPSIDE.

These pipes are made under steam pressure, and burnt to great hardness, and are capable of bearing nearly double the hydraulic pressure of ordinary glazed pipes. The prejudice against red-ware is overcome by this manufacture, and it is well known that good earthenware, UNGLAZED, is the oldest material discovered in a perfect state in Rome, Babylon, Nineveh, &c. &c.

TO LOCAL BOARDS OF HEALTH AND GAS AND WATER COMPANIES.

FREEMAN ROE'S PATENT SLUICE-

VALVES, acknowledged to be the best in use; hydrants or fire-plugs; wells sunk and bored; the hydraulic ram; fountains; pumps of every description. Estimates prepared for all works connected with hydraulics or gas. Pumps let on hire.

W. F ROE, late FREEMAN ROE, Hydraulic and Gas Engineer, 70, Strand, London.

Particulars may be obtained at the Auction Mart; and of Messrs. BEADEL and SONS, 26, Gresham-street, London.

BANKRUPTCY.

MR. ALFRED DAY has received instructions from Messrs. Roland and Evans, bankrupts, to SELL by AUCTION on the PREMISES, Peckford-street and Arling-ton-street New North-road, on TUESDAY AUGUST 26, 1856, at TWELVE, (unless in the reserve, the FIRST PORTION of the STOCK and UTENSILS in TRADE of a BUILDER, comprising an 8-horse power steam-engine, a 3-horse ditto, a 10-horse power boiler, circular saws, tables, up and down frame ditto, planing tables, grooving-machine, mortise ditto, moulding ditto, tenoning ditto, drying apparatus, Spanish mahogany plank, 70 pine plank, 1000 yellow deals, Dantzic and Christiana ditto, two square of flooring, 20 stacks of timber, 3 000 feet of sounding, sheet and pipe lead, 5,000 scaffold boards, 1,500 scaffold boards, ditto putlocks, 5 000 dozen of cord, 36 ladders, 31 firkins of white-lead, turps, oils, colours, glass paper, paperhangings, four excellent cart-horses, two nag horses, three brick-carts, five spring-carts, spring van, timber carriages, several sets of harness, ironmongery, bags of nails and brads, pullies, stash-weights, and fasteuings; bolts, caps, rain-water pipe, window glass, seventy carpenter's benches, cramps, erection of force, troughs, blocks, stakes, bellows, vices, drilling-machine, scales, weighing-machine, quantity of iron, iron frames, blocks, and falls; five powerful crabs, Caen, Bath, Portland, and Kentish rag stones, in blocks and landings; pan tiles, office fittings, sashes, and effects. May be viewed on Saturday and Monday preceding the sale. Catalogues to be had of Messrs. Abbott and Fitzroy, Solicitors, 16 Gresham-street, City: J. Nicholson, Esq. Official Assignee, 34, Basinghall-street; and of the Auctioneer, City-terrace, City-road, near the Eagle Tavern.

LEYTONSTONE, ESSEX, TO RAILWAY CONTRACTORS, BUILDERS, and OTHERS.—Important Sale of Railway Materials.

MR. J. GOWER has been directed by Thos. Brassey, esq. to SELL by AUCTION at the STATION, Leytonstone, Essex, on WEDNESDAY, AUGUST 27, the residue STOCK of HORSES, and his entire PLANT, comprising 190 tons contractors' rails, 42lbs to the yard; 340 earth wagons, timber dogs, dobbin, two wheel and other carts, 500 sleepers, wheels and axles; a quantity of wheeling planks, wheel-barrows, battens centres, pug-mills, and brickmaking materials, temporary fencing, crabs, weighing-machines, force, iron, and other pumps, box-bones, gang-ladders, an immense quantity of boarding slabs and miscellaneous timber, firewood, and other materials, too numerous for insertion. The temporary buildings, comprising stabling for upwards of 200 horses, smiths' and carpenters' shops, stores, cottages and office, carpenters and smiths' tools, with forges and fittings complete cast and wrought iron, harness, &c., which has been erected in forming the Woodford and Loughton Railway, sold in consequence of the same being completed and open for traffic. Leytonstone is within two miles of Stratford, and parties can view the premises and assist themselves free of carriage to all parts of the country, at a cheap rate of carriage.—On view two days prior. Catalogues had on the Works at the Station, and of Mr. Gower, at his Repository, Barbican, London.

REDHILL, near REIGATE, SURREY.—Valuable Freehold Building Land, or Villa Sites, containing about Eight Acres

MESSRS. NORTON, HOGGART, and TRIST have received instructions to OFFER for SALE, at the MART, on THURSDAY, AUGUST 28, at TWELVE, in one lot, a very valuable ENCLOSURE of FREEHOLD BUILDING LAND, containing nearly eight acres, situate fronting the estates of Lord Monson and Norman Wilkinson, Esq. on the road from Redhill to Reigate, and in the parish of Nutfield, a delightful and fine healthy part of the country, and the pleasant walks from the Redhill Station on the Brighton and South-Eastern Railways, and about three-quarters of an hour's ride from the metropolis. The property is on the rise of a hill, commands extensive views of the surrounding highly picturesque scenery, it has an important frontage of 500 feet to the road, extending 1100 feet in depth, and is admirably adapted for the erection of a gentleman's residence of a superior class, or for small semi-detached villas.—May be viewed, and particulars had at the Queen's Head Inn, Nutfield; at Laker's Hotel, Redhill; the White Hart, Reigate; of Messrs. Evernden, Wood, and Darvill, Solicitors, 22 and 23, Clement's-inn, Strand; of Mr. G. Pennington, Esq. 91, Newman-street, Oxford-street; at the Mart; and of Messrs. Norton, Hoggart, and Trist, 42, Old Broad-street, Royal Exchange.

HIGHGATE-HILL, AT THE JUNCTION OF MAIDEN-LANE.—Very valuable Freehold Estate, comprising a capital old-fashioned Family Residence, with Stabling, Gardens, and Paddocks, the whole comprising about SIX ACRES, full of said and brick earth, and, from its position, one of the most important and valuable building sites in the vicinity of London

MESSRS. FAREBROTHER, CLARK, and LAY are instructed to present for SALE, at GARRAWAYS COFFEE-HOUSE, on WEDNESDAY, the 20th of AUGUST, at TWELVE o'clock, in one lot, a very valuable FREEHOLD ESTATE, situate on Highgate-hill, at the junction with Maiden-lane, and close to the town; comprising a capital old-fashioned family residence, containing three parts and drawing rooms, nursery, seven bedrooms, and usual domestic offices, with coach-house, stabling, and brewhouse. Adjoining the residence is a coachmen's cottage, opening to the lawn and pleasure grounds, kitchen garden, paddock, and productive brick-field, the whole containing about six acres. The views from the property, over London and more extensive and from the great frontage, both to Highgate-hill and Maiden-lane, presents one of the most eligible building sites ever offered. The estate is full of brick earth and sand, and, being raised, the whole might be easily converted to brick purposes. Building plans may be viewed by cards only, whilst, with particulars and plans, may be had of D. Hudson, Esq. Solicitor, Gresham-street, City; at Garraway's; and at the Offices of Messrs. Farebrother, Clark, and Lay, Lancaster-place, Strand.

TO ENGINEERS AND OTHERS.

MESSRS. FULLER and HORSEY will SELL by AUCTION, on the PREMISES, Bridge-street, Greenwich, on TUESDAY, AUGUST 19, at ELEVEN, in lots, without reserve, the TOOLS and STOCK in TRADE of Mr. MOORE, including a 10-inch self-acting screw-cutting lathe, with 18 feet 6 inch bed, by Sandilands, Beacock, and Tannett; one 10-inch break lathe; self-acting planing machine to take in 10 feet by 3 feet, powerful self-acting boring-mill, one 15-inch double-geared surfacing lathe, small screw-cutting lathe, several small lathes of various dimensions, self-acting screw-cutting machine, drilling machine, two high pressure pendulous steam-engines, of 5 horse and 10 horse power, two steam boilers, a new horizontal steam engine of 2½ horse power, new washing machine, portable forges, blowing machine, vices, benches, and tools, a valuable assortment of patterns. Rend other requisites for the business.—To be viewed on MONDAY previous to the sale, when catalogues may be had on the Premises; of Messrs. Linton and Mason, Solicitors, 81, Basinghall-street; and of Messrs. Fuller and Horsey, Billiter-street, City.

SALES BY AUCTION.

TO BUILDERS, CONTRACTORS, SAW-MILL PROPRIETORS, ENGINEERS, AND OTHERS.

MESSRS. To be viewed on Friday and Saturday previous to the sale, when catalogues at 6d. each may be had at the Works, and of Messrs. Fuller and Horsey, Billiter-street, City.

TO BUILDERS AND OTHERS.

MESSRS. FULLER and HORSEY will SELL by AUCTION, at the FACTORY, Ranelagh-road, Thames-bank, Pimlico, on WEDNESDAY, SEPTEMBER 10th, and following day, at ELEVEN, the STOCK of well seasoned DEALS, fir, from 1 inch to 9 inches, spruce feet 1 inch, match boards, 15 feet run oak and mahogany, 20 feet run spruce and pine plank, 500 feet mahogany and wainscot plank, 40 cubic feet Dantzic timber, 10 squares 11 inch pre-ared flooring, 50 feet moulding and beading, 150 panelled doors, 200 pairs sashes and frames, 500 oak sills, 100 prepared window linings, a stock of builders' ironmongery in oak pallets, hinges, bolts, locks, nails, screws, files, &c. 3 tons best round rod iron, 5 cwt. gun metal, 1 ton sheet iron, brass cabinet work, and other effects.—To be viewed on Friday and Saturday previous to the Sale, when catalogues at 6d. each may be had on the Premises; and of Messrs. Fuller and Horsey, Billiter-street, City.

TO ENGINEERS AND OTHERS

MESSRS. FULLER and HORSEY are instructed by the Proprietor, who is retiring to SELL by AUCTION, on the PREMISES, Herbert-road, Waterloo-road, on TUESDAY, SEPTEMBER 23, and following days, at ELEVEN, in lots, without reserve the MACHINERY, Tools, and Stock in-Trade of a LATHE and TOOL MAKER (the tools principally by Smith Beacock, and Tannett, of Leeds), including fourteen self-acting lathes, one 18-inch and one 10 inch screw-cutting, with beds 22 feet and 12 feet long, seven screw-cutting, from 58 inches to 84 inches centre; four surfacing lathes, to take in surfaces from 4 feet to 7 feet diameter; two boring-mills, thirty engine and hand-turning lathes, with slides; five self-acting planing-machines, the largest to take in 3 feet wide and 12 feet long; three self-acting shaping-machines, three self-acting drilling-machines, slotting machine, screwing machine, wheel-cutting machine, oscillating steam-engine of 14-horse power, Cornish steam boiler, 18 feet long; 300 feet turned bright shafting, overhead motions, riggers, straps, and driving gear; fifty steel work-benches, boring-bars and heads, steel tools stocks, and dies; forges, anvils, &c. 3 lots of fine cast and shear steel, ten tons of bar and rod iron, and numerous other effects.—To be viewed on Saturday and Monday previous to the sale, when catalogues may be had on the Premises; or of Messrs. Fuller and Horsey, Billiter-street, City.

Highly finished Condensing Steam-Engine, by Naysmyth.

MESSRS. FULLER and HORSEY are instructed by the Right Honourable the Lords Commissioner of her Majesty's Board of Works to SELL by AUCTION, at HERBERT'S BUILDINGS, Waterloo-road, on WEDNESDAY, SEPTEMBER 24, at ELEVEN, the well finished direct acting, CONDENSING STEAM-ENGINE, by Naysmyth, with launch expander, 2 feet stroke, D slide-valve, throttle-valve and governors, air-pump and two feed pumps, 12 inch and 6 inch metal eccentric, bright wrought-iron crank-shaft, fly-wheel, condenser, and apparatus, made for the Houses of Parliament.—To be viewed on Tuesday previous to the sale, when catalogues may be had on the Premises; and of Messrs. Fuller and Horsey, Billiter-street, City.

IMPORTANT WATER-SIDE PROPERTY, ON THE THAMES, IN THE CITY OF LONDON

MESSRS. FULLER and HORSEY are instructed by William Crawshay, Esq. to SELL by AUCTION, on WEDNESDAY, OCTOBER 15, at TWELVE, at the MART (unless an acceptable offer is previously made by private contract), the valuable and important FREEHOLD WHARF, Upper Thames-street, in the city of London, having a frontage of 133 feet, and occupying a superficial area of about 34,000 square feet, a site unrivalled in the metropolis, either as a depôt for landing and housing goods or for carrying on any wholesale business for which extensive waterside premises are desirable. George-yard is universally known as the London establishment of Mr. Crawshay, the eminent ironmaster, and has been in the occupation of himself and predecessors for more than a century. The trade carried on ranks among the first in the City, the returns are very large, and, to any firm wishing to occupy the premises for the same business, a large proportion of the connexion may doubtless be secured. In the year 1842 the occupier expended many thousands of pounds in the erection of a massive pile of buildings, 100 feet in length by 50 feet in width, abutting to the river, the structure is of the most substantial character, and, if needful for the purposes of warehousing goods, the foundation and walls are quite equal to support an addition of several stories above those already erected. The building is one lofty ground-floor, with gallery supported on iron girders and columns, and constructed to carry any weight. There is also a stack of warehouses, abutting on the river, 75 feet in length, of two floors, and a stack of warehouses, 65 feet in length, of three floors, abutting on Thames-street. A commodious dwelling-house in the yard, the lower part occupied as offices for clerks and principals. A comfortable dwelling-house in Thames-street, and spacious paved yards, with two separate outlets into Thames-street, and convenient for loading and drawing goods. The whole held on lease from the Corporation of London, for a term which will expire in the year 1900, subject to the rent of 1,300 per annum. Two small warehouses adjoining, of three floors, with frontage of 133 feet in Castle-yard, may be added, if desired, at a rent of 150 per annum To be viewed till the sale. Particulars, plans, and conditions of sale shortly be ready, and may be obtained at the Mart; of Messrs. Crowders and Mackrell, Solicitors, 57, Coleman-street; and of Messrs. Fuller and Horsey, Billiter-street, London.

TO TIMBER MERCHANTS, BUILDERS, SAW-MILL PROPRIETORS, AND OTHERS.

MR. MARSH has been favoured with instructions from the Mortgagee, to submit to PUBLIC COMPETITION, at the PREMISES, 128, Arch. Globe-road, Mile-end, leasehold Mile-end Station (the Eastern Counties Railway), on THURSDAY, the 21st of AUGUST, at ONE precisely, the following first-rate NEW MACHINERY, planing machine, re-sawing machine, cross saw-frames, circular-saws, circular saw benches, bands, buckles, and other useful Plant, and a large quantity of useful quartering, and 100 squares of prepared floor-boards.—Catalogues obtained of the Auctioneer, Philpot-street, Commercial-road East.

Timber Trees at Hampstead, close to Downshire-hill.

MESSRS. HAMMOND and EILOART will SELL by AUCTION on the PREMISES, adjoining Mrs. Hoare's, close to Downshire-hill, Hampstead, on TUESDAY, AUGUST 19, at TWELVE for ONE, FIFTY LIME-TREES, SIX ELM, TEN FIR, and TWO CHESTNUT, some of very large size; also, hard woods, holly, elder, laburnum, cherry, &c.; fire-wood roots, butts, tops, &c. The timber is thrown and lying in a meadow, with a good road, only 200 yards from the high road at Hampstead.—Can be viewed any time before sale; and catalogues had at the Red Lion, adjoining the Premises; and at the Auction Offices, 38, Chancery-lane, London.

SALES BY AUCTION.

REIGATE. Important and Valuable Freehold Estate, approaching 70 acres. Free from land-tax. A most attractive investment for residence or speculative enterprise, near to the Railway Station, at Red-hill.

MR. WILLIAM THORNTON is instructed to submit to PUBLIC COMPETITION at the MART, on FRIDAY, AUGUST 29, the unsold and preferable portion of this very desirable PROPERTY, lying within a ring fence, and beautifully studded with timber, park like in appearance, and commanding extensive and picturesque views over the Vale of Holmsdale, Gatton park woods forming a prominent feature in the foreground. It is difficult to overrate the importance of this estate, either for a public institution, or as a source of certain and most profitable investment for any building operations of magnitude. The property is bounded on the west by the estate of Lord Monson, and on the south by the recently purchased residential estates of Norman Wilkinson, esq. and H. T. Gurney, esq. The well known salubrity of the air of the district has become a proverb. The railway, a few hundred yards distant, offers a daily choice by 190 trains for communication with all parts of England, and the metropolis is reached in thirty-five minutes. Superior building stone underlies a considerable portion of the estate, and brick earth and sand are also found. There is also a large old-roomed house, with various agricultural buildings, garden, orchard, &c. In addition to these advantages, it may be mentioned that it is the only freehold estate of the same extent and proximity to the railway in the market, and that the demand for land has caused an increase, it is daily rising in value and public estimation. Since the property was first offered for sale, 35 acres have been disposed of; it will now be first offered in the entirety, and if a satisfactory price be not thus obtained it will be submitted in three lots. Full descriptive particulars will shortly be issued having conditions of sale and plans annexed, and they may be obtained at the Junction Hotel, Redhill; Old Ship, Brighton; Calverly Hotel, Tunbridge-wells; Crown, Tunbridge; Grayshott House, Portsmouth; Star and Garter, Hyde Park-corner; Swan, Kingston; Swan, Staines; Waterloo, Cobham; Swan, Sevenoaks; of Mr. Morrison, Son, and Sir, G. Murrell's, Solicitors, Reigate; of Messrs. Drewe and Wilkinson, and Fell, Solicitors, Croydon; at the Auction Mart; and of Mr. Wm. Thornton, Land Agent, Surveyor, and Auctioneer, Reigate

WORTH, SUSSEX.—Valuable Freehold Building Land, in extent upwards of thirteen acres, in the district now popularly known, and in most request as Ifield-park, within about three miles of the Horley, or Three Bridges Stations, on the Brighton Railway.

MR. WILLIAM THORNTON is instructed to submit to PUBLIC COMPETITION, at the MART, on WEDNESDAY, AUGUST 20, at TWELVE, in One Lot, a valuable AREA of BUILDING GROUND, in all fairly situate, adjoining the high road leading from Barstow to Three Bridges, to which it has a very extensive frontage, as also to the new road leading from thence to East Grinstead, and in actually the preferable part of this district. The situation is rural ground, commanding singularly picturesque views, and the neighborhood is proverbially healthy, many detached villas have been already erected in the immediate vicinity of the property, and a plan has been prepared, and may be inspected at the office of the Auctioneer, for rendering it available for erecting detached villas, with gardens, for which it is exceedingly eligible, a brickyard being situate within a few minutes' walk of the spot, and the approach by excellent roads. Conditions of sale will be produced and read in the Sale-room, and may be seen previously at the Office of the Auctioneer, Whitehall-place, London, readily give any further information that may be desired. Auction and Estate Offices, Reigate.

Extensive Brick-built Factory, with steam Yard, Manor-street, King's-road, Chelsea

MR. OUGHTON will SELL by AUCTION, at the COMMERCIAL-HALL, King's-road, Chelsea, on THURSDAY, AUGUST 21, 1856, at ONE for TWO o'clock, by order of the mortgagee, the first eighty-three years unexpired, held direct from the Freeholder, of the substantial, nearly new, lofty, two floor brick built FACTORY, 74 feet long by 36 feet wide, and large walled Yard, desirably situated, with a frontage of 100 feet, to Manor-street, from Manor-street, King's-road, Chelsea, suitable for a Builder, Cabinet-maker, Ironfounder, or others requiring space. For particulars and conditions of sale, apply to Messrs. Blake, Son, and Farebrother, Solicitors, 23, Bedford-row, Holborn; or of Mr. Oughton, Auctioneer, Fulham-road, Chelsea.

TO TIMBER MERCHANTS, BUILDERS, ENGINEERS, WHEELWRIGHTS, AND OTHERS.—By

MESSRS. WHITE and SONS, on the PREMISES, Belmont-wharf, Maiden-lane, King's-cross, on MONDAY, AUGUST 25th, 1856, and the following day, if not previously disposed of by private contract, the valuable converted STOCK of a TIMBER MERCHANT. The very useful stock comprises a large quantity of excellent oak, elm, horse-beam, and cherry plank, about 30 tons of yellow deals respectively, capital ash, and beech plank, also fir and oak quarterings, ash poles, ash planks, gravel planks, gas and fence posts, about 200 loads of rough ash, ash halvers, and ash and elm scantlings, also a quantity of beech rails, ash halvers, at the same place, a capital new canal barge, constructed in the best manner to carry seventy tons. The lots may be viewed on the Premises, and at the City of York Tavern, near thereto; at the Canal Bridge Wharf, Regent's-canal, of Mr. Weakley, Station-clerk, 91, Farringdon-street, London; and of the Auctioneers, 11, Bush-street, Bethnal-green, who will forward them to applicants by post.

TO BRICKBURNERS, BUILDERS, SPECULATORS, AND OTHERS. Ash-common, adjoining Ash Timber Wharf.—Upwards of TWO ACRES and a HALF of Valuable FREEHOLD Hand-made and Machine BUILDING LAND, and a Three-hole close Scotch Kiln, in full work, with a brickburner's cottage and sand-house, and upwards of 2,000,000 fine building bricks, 5,000 waste bricks, 1 parcel earth for moulding, 20,000 tiles, and 15 square yards of drain tiles, the working plant, &c. TO BE SOLD BY AUCTION, by

MR. DRURY, at the sign of the CHESTERS ARMS, South-Eastern Railway Station, Ash, on MONDAY, the 25th of AUGUST, 1856, at THREE for FOUR o'clock, in One Lot, by order of the proprietor, Mr. Andrew Fey, subject to such conditions as will be produced at the time of the sale, immediate possession may be had. The above is well supplied with water from a well on the ground. The property is most desirably situate for building purposes, having a commanding view of the Alderman's Hill, only one mile from the camp, half a mile from the South-Eastern Railway station, and one mile from the South-Western Railway station. It also possesses the advantage of water carriage, being close to the Basingstoke canal, and a capital hard road for land-carriage, with a frontage for building to the high road of 60 feet, and a depth of 420 feet, bounded by the canal.—May be viewed at any time preceding the sale, on application to Mr. Drury, keeper of the property; and further particulars known of Mr. George White, Solicitor, Wandsworth; and of the Auctioneer, 70, High-street, Guildford, Surrey.

BOROUGH-ROAD.—Well executed Stone Figures, Vases, Fountains, &c. in Artificial Stone.

MESSRS. EVERSFIELD and HORNE are instructed by the Proprietor to SELL by AUCTION, on the PREMISES, 124, Borough-road, South side, on WEDNESDAY, SEPTEMBER 3, and following day, at TWELVE for ONE, the remaining portion of the extensive STOCK, comprising Statuary, Vases, groups, pedestals, centre flowers, &c. To be sold without reserve.—May be viewed two weeks previous, and catalogues had at the Premises and of the Auctioneers, 34, Parliament-street Westminster.

LONDON: Printed by CHARLES WYMAN, of 13, Hunter-street, Brunswick-square, in the Parish of St. George, Bloomsbury, Printer, at the Printing-office of COX Brothers & WYMAN, 74 & 75, Great Queen-street, Lincoln's-inn-fields, in the Parish of St. Giles-in-the-Fields; and published by the said CHARLES WYMAN, at the Office of "THE BUILDER," in York-street, in the Parish of St. Paul, Covent Garden, all in the County of Middlesex.—Saturday, August 16, 1856.

ART-UNION of GLASGOW.—Exhibition of Prize Paintings: admission free.—The EXHIBITION of PAINTINGS and other Works of Art, purchased for distribution among the Members of the Society for the present year is now OPEN, at the Gallery of the Old Water-Colour Society, 5A, Pall-mall East.

ROBERT ALEXANDER KIDSTON, Acting Secretary Art-Union of Glasgow.

COMPETITIONS.

TO ARCHITECTS.—BOROUGH of NEW WINDSOR.—Notice is hereby given, that the Council of this Borough, as the Burial Board thereof, are ready to receive PLANS and DESIGNS for TWO CHAPELS, a CURATOR'S HOUSE, and ENTRANCE-GATES, and the WALLS and FENCES, which will be required to be erected on the Burial-ground for this Borough. The Council do not pledge themselves to adopt any of the plans and designs which may be furnished, but should any of them be adopted, and the architect preparing the same not be employed in carrying out the works, he will be paid 10*l.* 10*s.* for the plan and designs, and the rest of the plans, &c. will be returned to the various parties within fourteen days after the same shall have been delivered to me. All plans and designs must be delivered to me on or before TWELVE o'clock, on MONDAY, the 24th day of AUGUST instant. A plan of the ground may be seen, and all further information obtained, at my Office, Pilgrim-place, Windsor.—By order,

HENRY DARVILL, Town Clerk.

Windsor, 8th August, 1856.

THE PARISH of LEWISHAM, in the County of Kent.—To ARCHITECTS and OTHERS.—The Burial Board for the Parish of Lewisham, in the County of Kent, are desirous of procuring DESIGNS for LAYING OFF the GROUND, and the ERECTION of TWO CHAPELS, SEXTON'S LODGE, and ENTRANCE-GATES, accompanied with detail working drawings, specifications, and estimates. The outlay for the chapels, lodge, and gates must not exceed 2,000*l.* The Board will award to the author of the best design, in their judgment, subject to the approval of such design by the Bishop of the Diocese, the sum of 20*l.* The design for which the premium is awarded will become the property of the Burial Board, who will not bind themselves to employ the author to superintend carrying out the works. The Board will not pay the premium unless a sufficient Tender be made for the erection of the chapels, lodge, and gates at or within the stipulated sum of 2,000*l.* If the Board employ the author of the design to superintend the execution of the buildings, the premium will merge in the commission, which is not to exceed five per cent. on the lowest Tender accepted, including travelling and other expenses. A plan of the land may be inspected, and general instructions be obtained, at the Office of the Clerk of the Board, in Grove-place, Lewisham, where the designs must be deposited, free of all expenses, on or before the 8th day of SEPTEMBER next, marked with an emblem or motto, and accompanied by a sealed note, addressed to the Board, having the same emblem or motto on the outside, and inclosing the name and address of the author. The designs not approved will be returned to the authors on application.—By order of the Board.

OCTAVIUS C. FRYON EAGLETON, Clerk.

Grove-place, Lewisham, August 19, 1856.

TO SURVEYORS and OTHERS.—PREMIUMS for PLANS.—The Trustees for Sale of a Freehold Estate of 17 acres, including the Bodish Sea, and near the Crystal Palace, require PLANS for LAYING OUT the SAME for building purposes, showing the necessary roads, sewers, &c., the whole to be clearly defined and approved in suitable lots, and laid down to a scale of an inch to an inch, from actual admeasurement. The following premiums are offered:—For the plan adjudged the best by the trustees, 150 guineas; for the second, 100 guineas; for the third, 50 guineas. The plans to which the above premiums shall be awarded, will be returned by and be the property of the trustees.—Further particulars may be obtained of Mr. PEACOCK, Builder, near the Jolly Sailor Station, Norwood; close to the property. The trustees will meet on the 20th day of OCTOBER next, to examine the plans, which are to be previously forwarded, enclosed and sealed, to the Secretary's Office, Auction Mart, London, addressed to the Trustees of the White Horse, Norwood, Estate.

COMPETITIONS.

CITY of LICHFIELD.—The Corporation of Lichfield having determined to establish a MUSEUM and LIBRARY, under the Public Libraries Act, 1855, architects are invited by the committee to offer a plan and estimate, with specification, for a suitable building, and are requested to send them to the Town Clerk's Office, on or before the 22nd of SEPTEMBER. The first outlay will not exceed 1,000*l.* Further information as to the site, required accommodation, in the first instance, and other particulars, may be had on application personally or by letter.

CHARLES SIMPSON, Town Clerk.

CONTRACTS.

TO BUILDERS.—Notice is hereby given, that TENDERS will be received by the War Department, at their Office, Pall-Mall, London, on THURSDAY, the 28th day of AUGUST, 1856, from such persons as may be willing to undertake the ERECTION of a BARRACK for Married Soldiers, with OUTBUILDINGS, &c. at Portsea, in the county of Hants. The plans, specification, and conditions of Contract, may be seen, and every information obtained, on application at this Office, on and after the 31st AUGUST, 1856, between the hours of TEN and FOUR each day (Sundays excepted). Tenders to be endorsed, "Tenders for Soldiers, with Outbuildings, &c. at Portsea," and addressed to the Director-General of Contracts, War Department, Pall-Mall.

Royal Engineer Office, Portsmouth, July 30, 1856.

WAR DEPARTMENT.—Such Persons as may be desirous of TENDERING for the SUPPLY and ERECTION of a GAS HOLDER and TANK, with FITMENTS complete, at the Royal Small Arms Factory, Enfield Lock, may receive information relative thereto, by application at the Royal Engineer Office, Enfield Lock, up to the 23rd AUGUST, 1856. Tenders to be delivered on the 26th AUGUST, 1856, addressed to the Director-General of Contracts, War Department, Pall-Mall. The War Department reserve to themselves the right of rejecting the whole or any of the Tenders.

Royal Engineer Office, Enfield Lock, August 11, 1856.

TO BUILDERS.—Notice is hereby given, that TENDERS will be received by the War Department, at their Office, Pall-Mall, London, on MONDAY, the 8th day of SEPTEMBER, 1856, from such persons as may be willing to undertake the ERECTION of a BOMB-PROOF MAGAZINE, to contain 10,368 Barrels of Gunpowder, at Tipner, near Portsmouth, in the county of Hants. The plans, specification, and conditions of Contract, may be seen, and every information obtained on application at this Office, on or after the 18th day of AUGUST, 1856, between the hours of TEN and FOUR each day (Sundays excepted). Tenders to be endorsed, "Tender for the Erection of a Bomb-Proof Magazine, at Tipner, near Portsmouth, in the county of Hants."

N.B. The War Department reserves to itself the right of rejecting the whole or any of the Tenders.

Royal Engineer Office, Portsmouth, August 7, 1856.

Royal Engineer Office, Portsmouth, 13th August, 1856.

TO BUILDERS.—Notice is hereby given that TENDERS will be received at the office of the Director-General of Contracts, War Department, Pall-Mall, London, on or before the 15th SEPTEMBER, 1856, from such persons as may be desirous of entering into an agreement with the War Department for CONSTRUCTING and REPAIRING FOUR POWDER MAGAZINES to contain 25,000 barrels, and EIGHT SHOEING-SHEDS, together with boundary walls, rolling stage, and earth traverse, at Marchwood, in the county of Hants. Plans and specifications, with forms of Tender, may be seen, and all other information obtained, on application at this Office, any day (Sundays excepted) between the hours of TEN and FOUR, from the 25th AUGUST, 1856, to 14th SEPTEMBER, 1856. The whole of the work to be completed within eight calendar months from the date of notification of acceptance of Tender. No Tender will be taken of any Tender unless it be on the prescribed form. The War Department reserve to themselves the right of rejecting the whole or any of the Tenders.

BASINGSTOKE CEMETERY.—To BUILDERS, CONTRACTORS, and OTHERS.—The Burial Board for the Parish of Basingstoke are prepared to receive TENDERS for the FORMATION of ROADS and PATHS, and the ERECTION of CHAPELS, LODGE, ENTRANCE-GATES, BOUNDARY FENCES, &c. on the site of the proposed Cemetery at Basingstoke. The plans, drawings conditions, and specifications can be seen, and information and bills of quantities obtained at the Offices of the Architects, Messrs. PULTON and WOODMAN, 1, Grey Friars-road, Reading, between the hours of TEN a.m. and FIVE p.m. from WEDNESDAY, SEPTEMBER 3rd, to MONDAY, SEPTEMBER 8th. The estimates to be prepared separately, as follows:—No. 1. Formation of Roads and Paths; 2. Erection of Chapels, Lodge, and Entrance; 3. Boundary Fences. Each contractor may tender for one or more of these divisions of the work. All Tenders are to be sealed up, endorsed, and sent in to the Clerk to the Board, on or before TUESDAY, SEPTEMBER 9th, at TWELVE o'clock at noon. The Board do not bind themselves to accept the lowest or any of the Tenders.—By order,

J. C. SHEBBEARE, Clerk to the Board.

Basingstoke, August 18, 1856.

THE GREAT NORTHERN RAILWAY COMPANY.—To CONTRACTORS and BUILDERS. The Directors are prepared to receive TENDERS for the ERECTION of FIFTY COTTAGE DWELLINGS, at New England, near Peterborough. Parties disposed to Tender may obtain the drawing, specification, and form of Tender, which form only Tenders will be received, on payment of 5*s.* per set, upon application at this Office, on or after WEDNESDAY, the 6th AUGUST. Tenders sealed up and marked "Tenders for Cottages," must be lodged at this Office before TWELVE o'CLOCK at noon on TUESDAY, the 26th AUGUST instant, when parties tendering must be in attendance.

N.B.—The Directors do not bind themselves to accept the lowest or any Tender.

By order,

J. R. MOWATT, Secretary.

Secretary's Office, King's-cross Station, London, 5th August, 1856.

CONTRACTS.

TO DUST CONTRACTORS.—The Vestry of the Parish of Chelsea will meet at the Board-Room, Manor House, King's-road, Chelsea, on TUESDAY, the 2nd day of SEPTEMBER next, at ELEVEN o'clock in the forenoon, precisely, to receive TENDERS from persons willing to Contract from the 29th day of SEPTEMBER next, up to and including the 29th day of SEPTEMBER, 1857, pursuant to the terms of a Draft Contract now lying at my Office, for COLLECTING and REMOVING the DUST, ASHES, and RUBBISH from the houses and other places within one or more of the several districts within the said parish. Sealed Tenders, signed by the proposed Contractor, with the names and descriptions of two sufficient sureties for the performance of his Contract, to be left at my Office, on or before SATURDAY, the 30th instant. The legal charges of the Contract to be paid by the Contractor upon the execution of the same. The Vestry do not bind themselves to accept the lowest or any Tender; and none will be received unless made on one of the printed forms to be obtained at my Office.—By order,

CHARLES LAIRE, Vestry Clerk.

Offices of the Vestry, Manor House, King's-road, Chelsea, August, 1856.

COUNTY of DURHAM LUNATIC ASYLUM.—To BUILDERS, ENGINEERS, CONTRACTORS, and OTHERS.—The Committee of Visitors are prepared to receive TENDERS for the whole or any part of the several WORKS required to be done in the ERECTION of the County of Durham LUNATIC ASYLUM, near Sedgefield, in the county of Durham. The plans, specifications, and conditions may be inspected at the Office of the Architect, Mr. JOHN HOWISON, County Courts, Durham, where further particulars may be ascertained, and of whom detailed measurements and form of Tender may be obtained. Sealed Tenders, endorsed "Tender for County Lunatic Asylum," addressed to ROWLAND BURDON, Esq. Chairman of the Committee of Visitors, must be sent to Mr. HOWISON's Office, on or before TUESDAY, the 2nd day of SEPTEMBER next. The party whose Tender may be accepted will be required to enter into a bond, with two satisfactory sureties, for the due performance of the contract. The Committee do not pledge themselves to accept the lowest or any Tender.—By order,

JOHN WATSON, Clerk to the Committee.

Durham, July 12th, 1856.

BRECON.—To BUILDERS.—Persons desirous of TENDERING for the RESTORATION and ENLARGEMENT of the Parish Church of St. Mary, Brecon, may see the plans and specifications, and obtain forms of the quantities, at the Office of the Architects, Messrs. W. G. and E. HABERSHON, 38, Bloomsbury-square, London; or at their local Offices at Newport or Cardiff respectively; and also at Brecon, on or after AUGUST 25th. Tenders to be addressed to the Vestry, Brecon, on TUESDAY, AUGUST 26th, by TWELVE o'clock precisely, who do not bind themselves to accept the lowest or any of the Tenders. The day of opening Tenders is postponed till FRIDAY, the 29th, from TUESDAY, the 26th.

CARDIFF, GLAMORGAN.—TO BUILDERS.—Persons desirous of TENDERING for the ERECTION of TWO first-class semi-detached VILLAS at Cardiff, with walls, offices, &c.; also for TWO other VILLAS of similar character in same town; also for THREE HOUSES connected together, with walls and fittings in stone, may see drawings and specifications, and obtain quantities, at the Offices of the Architects, Messrs. W. G. and E. HABERSHON, 38, Bloomsbury-square, London; or at their local Offices at Newport, Monmouth, by application to their resident clerk, Mr. DIXON; or at Cardiff, to their resident clerk, Mr. FAULKNER, on or after AUGUST 25th. Tenders to be delivered to Architects at Cardiff on THURSDAY, AUGUST 28th, who do not bind themselves to accept the lowest or any of the Tenders.

TO BUILDERS.—Persons desirous of CONTRACTING for the ERECTION of NEW PHILOLOGICAL SCHOOLS, in the Newport, may see the plans, and specification at the Offices of the Architects, Messrs. W. G. and E. HABERSHON, 2, Bloomsbury-square, London; application on and after MONDAY next. Tenders to be delivered to Mr. Griffiths, at the Queen's Head Inn, Commercial-street, Newport, on TUESDAY, AUGUST 26th, by TWELVE o'clock, on MONDAY next, SEPTEMBER 1st.—The Committee do not bind themselves to accept the lowest or any of the Tenders.

TO BUILDERS.—Persons desirous of CONTRACTING for the ERECTION of a NEW CHAPEL at Ripon, Yorkshire, may see the plans, specifications, and obtain the quantities prepared for the Architects, Messrs. WM. G. and E. HABERSHON, London, or at their Local Offices at Newport and Cardiff respectively. Tenders to be delivered at the Office of the Architects, on THURSDAY, AUGUST 28th, by TWELVE o'clock at noon, the day on which they will be opened at the Ripon Union, in presence of all those who may desire.

THREE first-class AUGUST 28th, by TWELVE o'clock at noon, the day on which they will be opened at the Ripon Union, in presence of all those who may desire.

NOTICE.—CONSTRUCTION of a CANAL in DENMARK.—The Royal Danish Ministry for Home Affairs offers to public COMPETITION the FORMATION of a SHIP CANAL, together with the necessary Harbour conditions may be had at the Office of the Royal Danish Consulate-General, for inspection; also of the Danish General Consuls in Hamburg, Berlin, and Paris. Sealed written schemes must be addressed to the "Ministry for Home Affairs," and there must be written thereon "Tender for the Construction of Limfjord Canal," which are then forwarded to the Ministry for Home Affairs, before TWELVE o'clock a.m. on the 22nd of NOVEMBER next, which time they will be opened at the Ship Canal Office in presence of all those who may desire.

Royal Ministry for Home Affairs, Copenhagen, August 11, 1856.

Danish Consulate General, London, August 19, 1856.

[For remainder of Contracts see next page.

CONTRACTS.

NEWARK-UPON-TRENT IMPROVEMENT ACT, 1856.—To CONTRACTORS, PAVIORS, and OTHERS. The Commissioners are desirous to receive TENDERS for the following WORKS, viz.:—

For the supply of MATERIALS and the PAVING, MAKING, and COMPLETING of about 1,000 yards of FOOTWAYS in the Town of Newark, and about 1,000 yards of CARRIAGE-WAYS in the Town of Newark, and the Hamlet of Balderton, in the County of Nottingham, according to the Specifications and Forms of Tender to be seen, on and after the 1st day of September next, at the Office of Mr. C. BAILEY, Surveyor, Kirkgate, Newark.

Sealed Tenders must be delivered at the said Office, addressed to the Commissioners, on or before the 20th day of September next. The Engineer will be required by the Commissioners to accept the lowest or any Tender. The Commissioners do not pledge themselves to accept the lowest or any Tender.

T. ALLEN, } Assistant
B. PENALL, } Commissioners.
J. BRIFFIN, }

Newark-upon-Trent, August 19, 1856.

TO BUILDERS.—CHELTENHAM COLLEGE.—The Board of Directors of the Cheltenham College, are willing to receive TENDERS for the ERECTION of a CHAPEL, in connection with the Institution. The drawings and specification, bills of quantities, may be inspected at the Offices of Mr. DANIEL JAMES HUMPHRIS, Architect, 6, Clifton-street, Finsbury, London, on and after Tuesday next, the 19th instant. The Tenders are to be delivered to Mr. W. L. BAIN, the Secretary, on or before the 1st day of SEPTEMBER next. The Directors do not pledge themselves to accept the lowest Tender.

D. J. HUMPHRIS, Architect.

London-road, Cheltenham.

NETHERLANDS LAND ENCLOSURE COMPANY.—The Directors of the Netherlands Land Enclosure Company are prepared to receive TENDERS for the CONSTRUCTION of a SHIP CANAL to connect the East and West Zuyder Zees, and for the RECLAMATION of about 60,000 acres of land. Plans and specifications may be inspected at the office of Mr. G. P. BIDDER, C.E., and Mr. GEORGE ROBERT STEPHENSON, 24, Great George-street, Westminster, to whom references may be made, and of whom Tenders may be obtained. Tenders must be delivered at the Offices of the Company, 2, Victoria-street, London, S.W., on or before the 1st day of September next.

By order of the Board,
GEORGE PASSINI, Secretary.

BOARD of WORKS for the STRAND DISTRICT.—To DUSTMEN, SCAVENGERS, and CONTRACTORS.—The Board are prepared to receive TENDERS for the REMOVAL of the DUST, ASHES, and other REFUSE MATTER, and for SCAVENGING the Streets, Courts, Alleys, Roads, and Public Places within the Strand District, for the term of three years, from Michaelmas-day next, determinable at the end of any year, by six months' notice. Every description of thing that may be swept up, or otherwise collected in or upon the several foot and carriage ways in the district; and also for the removal of DUST, ASHES, and other refuse matter from houses, sheds, and other places in the district, for the term of three years, from Michaelmas-day next, determinable at the expiration of any year, by six months' notice. Forms of Tender, and a copy of a specification which may be seen daily at the Board's Offices, No. 24, Henrietta-street, Covent-garden, from TEN till FOUR o'clock, may be had at the said Offices, on application. Tenders must be delivered at the said Offices, addressed to the Chairman of the Board, on or before TWELVE o'clock, at Noon, on Thursday, the 28th August instant. The Board do not bind themselves to accept the lowest Tender.

JAMES H. F. LEWIS, Clerk to the Board.

TO BUILDERS.—The Committee give notice that they intend to receive TENDERS for the ERECTION of a CHAPEL, SCHOOL-ROOMS, and MINISTER'S RESIDENCE, in connection with the Congregation worshipping in Trinity Chapel, Hoxton. Plans and specifications may be seen, and forms of Tender obtained, on application to Mr. FRANCIS ASHPITEL, F.S.A., at his Offices, No. 1, Old Broad-street, E.C., between the hours of Ten and Four o'clock. Tenders to be sent in on or before the 1st day of September next.

COUNTY of WORCESTER.—To BUILDERS and OTHERS.—Persons desirous of TENDERING for the several WORKS required in taking down the present and erecting a NEW EAST WING, also for the erection of a TURRET, in the PUBLIC BUILDINGS, in Worcester, County Gaol, may inspect the drawings and specifications, and obtain any information in reference to the same, at my Office, 4, Foregate-street, Worcester. Sealed Tenders to be forwarded, free of expense, to the Post Office, Worcester, addressed "Tender for Post Wing," and "Post to Press." No pledge is given to accept the lowest or any Tender, unless satisfactory.

HENRY ROWE, Jun., County Surveyor.

Worcester, August 18, 1856.

CONTRACTS.

HEANOR (DERBYSHIRE) WATER-WORKS.—The Local Board of Health for this District are prepared to receive TENDERS for the supply of GALVANIZED WROUGHT IRON PIPES and FITTINGS, to be applied and used for conveying Water Pipes. The tubes must be capable of sustaining a working pressure of 250 feet, and must be proved to a pressure equal to a column of water of 500 feet altitude. The quantity of tubing to be delivered by any contractor not to be not less than 1, and not to exceed more than 1 of several sizes varying from 4 to 2 inches diameter, and 1 to 1 in thickness internal diameter, and 1 will be required to determine. Any further information may be obtained on application to Mr. JNO S NORRIS, of Nottingham, the Engineer to the Local Board; and sealed Tenders, with samples of the several sizes, naming the price tendered per ton, at Basford, near Nottingham, on or before FRIDAY, the 29th day of AUGUST.

R. B SPENCER, Clerk to the Local Board.

August 18th, 1856.

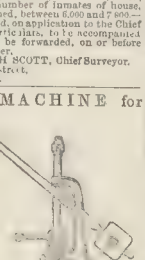
BOARD of WORKS for the LIMEHOUSE DISTRICT.—To BUILDERS, CONTRACTORS, and OTHERS.—The Board of Works for the Limehouse District are prepared to receive TENDERS, by 12 o'clock on the 2nd day of SEPTEMBER, 1856, for the several WORKS required in carrying into effect to contract for the LAYING DOWN CONSTRUCTING, and COMPLETELY FINISHING certain intended BRICK and PIPE SEWERS, 150 feet in length, or thereabouts, with other necessary works in the private carriage drive, garden, and Rich-street, in the parish of Limehouse; and in William-street and Hermitage-street, in the hamlet of Ratcliff; and for the maintenance of such works, complete and fit for twelve calendar months from the completion and acceptance of the above works, together with a form of Tender, may be inspected, and other particulars obtained, at the office of the Board, White Horse-street, Commercial-road East, between the hours of TEN a.m. and FOUR p.m. on and after the 23rd SEPTEMBER next. Tenders addressed to the Limehouse Board of Works, must be delivered at the said office before FOUR o'clock p.m. on the said 2nd SEPTEMBER, and no Tender will be received after that hour. The Board do not bind themselves to accept the lowest or any Tender, and the party whose Tender shall be accepted will be required to provide two sureties for the due performance of the works. The attendance of parties tendering will be required at the meeting of the Board on WEDNESDAY, the 3rd day of SEPTEMBER next, at the Board-room of the Ratcliff Workhouse, York street West, Commercial-road East, at THREE o'clock p.m.

THOS. W. RATCLIFF, Clerk of the Board.

White Horse-street, Commercial-road East, 30th August, 1856.

MACHINERY-TOOLS, &c.—The DOVER LOCAL BOARD of HEALTH are willing to receive TENDERS for the supply of certain MACHINERY TACKLE and TOOLS required for their Water and Drainage Works at Dover. Copies of the conditions, with lists of the articles required, may be obtained on application at their Office. Further particulars may be had at the Office of the Surveyor of the Town Board, and Tenders to be delivered at my Office on or before WEDNESDAY, the 27th instant.

T. B. BASS, Town Clerk.

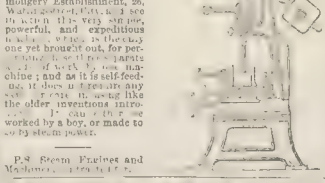


Dover, 9th August, 1856.

WASHING-MACHINES.—The Vestry of the Parish of St. Pancras, in the county of Middlesex, being about to erect a Steam Laundry, are desirous of receiving from Patentees and Manufacturers of WASHING-MACHINES particulars and descriptions of their respective machines setting forth in detail the method of cleansing the clothes, a description of the machinery and the cost thereof, exclusive of the boiler, including erecting and fixing, the estimated annual charges (wear, tear, and repairs), the annual working expenses, labour, soap, fuel, &c.) and all particulars. Average number of inmates of house, and the weekly number of articles washed, between 6000 and 7000.—Further information may be obtained, on application to the Chief Steward, as under, to whom the particulars, to be accompanied by testimonials of efficiency are to be forwarded, on or before THURSDAY, the 28th inst.—By order,

WM. BOOTH SCOTT, Chief Surveyor.

Department of Works, St. Pancras Board of Health,
Ham Steal-road, Aug. 19, 1856.



NEW PATENT MACHINE for MORTISING and TENONING HARD or SOFT Wood and BORING WOOD or IRON.

House and Coach Builders, Joiners, Cabinetmakers, and others, in the similar work, are invited to call at the Patentee, JOWIS, JAMES, and Co. Wholesale Builders and Cabinet Makers, Ironmongery Establishment, 26, Wellington-street, Strand, to see in motion this very simple, powerful, and expeditious machine; and as it is self-feeding, it does not require any skill from the sawing like the older inventions introduced, but can be worked by a boy, or made to go by steam power.

P.S. Steam Engines and Machinery, &c.

MACHINERY for SAWING, PLANING, MOULDING, &c.

SAMUEL WORSSAM and CO. beg to call the attention of [illegible] to their [illegible] of SAWING and PLANING MACHINERY, [illegible] and Planes as now in use in Saw Mills, Timber Yards, Joiners' Shops, &c. [illegible] for Sawing Veneers, Cutting Staves, Shaping Wood, &c. They have constructed several [illegible] of portable and stationary steam engines, and are thereby enabled at all times on short notice to supply them. S. W. and Co. beg to state that their machinery [illegible] is the result of much study and long practical experience in the working of machinery, and have had the honour of supplying some of the largest establishments [illegible] engaged in the manufacturing in the world with their machines, for home and foreign use. One of their Saw Benches is also a smaller one, with Boring Apparatus, &c., suitable for Cabinet Makers, Carvers, Chair Makers, &c. A descriptive Catalogue, with Drawings, may be had on application.

KING'S-ROAD, CHELSEA.

AUSTIN'S IMPERIAL PATENT SASH and BLIND LINE can be obtained of all ROPEMAKERS, IRONMONGERS, MERCHANTS, FACTORS, and WHOLESALE HOUSES, in TOWN or COUNTRY. Established 1774.

NAILS and IRONMONGERY From BIRMINGHAM direct.

Builders, Contractors, and Others, supplied with Nails, Iron, and Ironmongery of every description, at the LOWEST BIRMINGHAM PRICES.

A complete LIST of which will be forwarded upon application.

BLYTH and BIANCHI,
Nail Manufacturers and General Factors, BIRMINGHAM; or
at 16, Great-an street, LONDON.

WOOD-CUTTING MACHINERY, JOHN M'DOWALL and SONS, WALKINSHAW FOUNDRY, JOHNSTONE, near Glasgow, MANUFACTURERS of VERTICAL SAW-FRAMES (driven by straps),

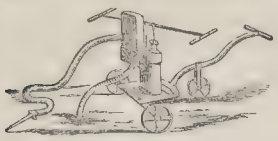
For cutting balks of timber, from 5 feet on the side down to the smallest deal frame.

Patent vertical saw-frames, of the following dimensions, with steam-power attached, circular cross-cut radial sawing machines; patent mortising and tenoning machines; patent horizontal cross-cut sawing machines, for heavy timber; planing machines, for working boards from a 4 of an inch thick to 6-inch deck plank; revolving planes, for preparing and shaping to any figures, as used by ship-builders; panel, and other planes for working mouldings; veneer mills of all sizes, with all sappendages; scale-board machines, for hat-boxes, &c.; patent sliding feed motions for saw-frames; and every description of machinery for cutting and sawing timber

ZINC ROOFING, INCLUDING TIMBER OR IRON FRAMEWORK,

IS AS

CHEAP AS SLATES OR GALVANIZED IRON, LIGHTER, AND MORE DURABLE.



Certificates, and Models of various descriptions, may be seen, and estimates obtained on application to

THE SURVEYOR OF THE VIEILLE MONTAGNE ZINC MINING COMPANY, 12, MANCHESTER BUILDINGS, WESTMINSTER.

ROOFS CONSTRUCTED UNDER HIS SUPERINTENDENCE GUARANTEED TO REQUIRE NO REPAIRS FOR AT LEAST TEN YEARS.

THE OLD METAL BEING ALWAYS RETAKEN AT HALF-PRICE, RENDERS IT ADVANTAGEOUS FOR ALL TEMPORARY BUILDINGS.

Many roofs covered with zinc thirty-five years ago have never required repairs.

B. FOWLER, HOLMAN, and CO.

SOLE MANUFACTURERS OF HOLMAN'S PATENT DOUBLE-ACTION CESSPOOL, SEWER FLUSHING, LIQUID MANURE, AND UNIVERSAL FORCE PUMP.

The simplest, cheapest, and best thing of the kind before the public; admirably adapted for thick substances; valve ways three inches special size, made to suit buyers of all kinds, 1 to 6 or 12, is portable, or can be fixed with perfect ease. Delivers a large quantity at small labour. A really good article, commanding extensive home and export sale.

BENJAMIN FOWLER and CO.

FIT UP HEATING-APPARATUS OF ALL KINDS,

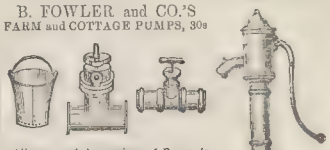
For Public Buildings, Private Mansions, Offices, Manufactories, and Horticultural Buildings,

And for every purpose where artificial heat is required.

They also erect DRYING-ROOMS for ASYLUMS, UNIONS' DOMESTIC and MANUFACTURING PURPOSES upon the most improved principles, and upon the largest or smallest scale.

STEAM COOKING and BATH APPARATUS FIXED;

Also PUMPS, for DEEP or SHALLOW WELLS,



To be worked by hand, horse, or steam power;

AND ALL KINDS OF

ENGINEERS', MILLWRIGHTS', or SMITHS' WORK, for Public or Private Establishments.

The most ample references from a long experience in the above branches can be given.

B. FOWLER and CO.'S FARM and COTTAGE PUMPS, 30s

All sizes and descriptions of Pump in various plans for ornamental purposes, for garden plants, for deep or shallow wells. Brass Lift Pumps, Engine Pumps, Horse-power Pumps, Draw Pumps, Wrought Lead and Rain-water Pumps, Sewer Pumps, Sluice and Hydrant Valves, at lowest prices.

N.B. Every attention paid to country, export, and trade orders. Experienced workmen sent to any part of the kingdom, to fix PUMP WORK, HOT-WATER, STEAM, BATH, or DRYING APPARATUS.

BENJAMIN FOWLER & CO. GENERAL ENGINEERS, WHITEFRIARS-STREET, FLEET-ST.

TYERMAN'S PATENT HOOP-IRON BOND,

FOR BUILDING PURPOSES.

ADOPTED BY SEVERAL DEPARTMENTS OF THE GOVERNMENT.

TARIFF OF PRICES
Beyond the current Price of Hoop-iron.

Gauge.	In. wide.	Per 1,000 ft.
No. 16 ..	1¼ ..	7s. 0d.

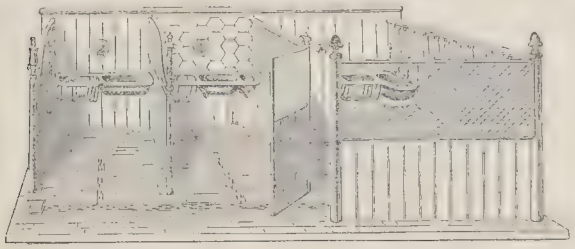
15 ..	2½ ..	9s. 6d.



THE PATENT BOND which is prepared from the ORDINARY HOOP IRON, by modifying it at intervals of 12 inches) is now being extensively used in the leading GOVERNMENT WORKS, DOCK BUILDINGS, BANKS, ASYLUMS, BRIDGES, VIADUCTS, PRISONS, ENGINE-HOUSES and MANUFACTORIES, as well as in other Public and Private Works, in London and in all parts of the Kingdom.

Sole Manufacturers—THOMAS PERRY and SONS, Highfields Works, Bilston.

London Depôt—ST. ANN'S WHARF, EARL-STREET, BLACKFRIARS.

NEW PATENT INVENTIONS FOR STABLE REQUISITES.

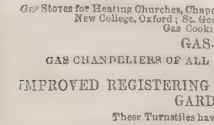
AWARDED A PRIZE AT THE PARIS EXHIBITION, AND PATRONISED BY THE ENGLISH AND FRENCH GOVERNMENTS.

COTTAM and HALLEN, of Winsley-street,

Are the original inventors of the PATENT ENAMELLED MANGER, WATER-TROUGH, and WROUGHT-IRON RACK, unlike any iron to-day, and for many years adopted and made, by Messrs. Bailey, Gaze, and other Rotherhithe, the full of which is taken the work of the manufacturers with ease and freedom to draw the said Bar. Cottam's new Patent Seed-Box, Italian Trellis, and Trellis-work, as long ornamental to the above Patents, are simple in construction, being durable, economical in use, and free from liability to get out of order. Also, the Patent Seed-box and Hay-rack combined, which can be used with great advantage where space is an object, as it may be put in one corner of the way when not in use.

Improved Harness Holders, for preserving the shape of the harness, and preventing its creasing. Patent Loose Box Fittings. Cheap and Durable Corn-Bins.

Improved Surface-Drain, with safety covers, Sanitary Traps, and every article for the harness-room and stable, kept in stock, plain, galvanized, and enamelled. Iron Gates, Fencing, Hurdles, &c.



The new Illustrated Catalogue, 1856, and estimates sent on application to

COTTAM AND HALLEN, 2, WINSLEY-STREET, OXFORD-STREET.

JAMES BARTON, Ironfounder, &c., 370, Oxford-street, London.

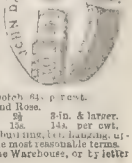
IMPORTANT to ENGINEERS, MILLOWNERS, &c. NORTH WOOLWICH EAST STEAM PACKING Company, Limited, Offices, 21, Lombard-street, London. Registered per 5 & 6 Vict., cap. 18. Capital £10,000, in 10,000 Shares of £1 each. Deposit per Share, 2s. 6d. Further Calls not to exceed 5s. per Share, and not more than one Call in any three months. CAUTION.—Some persons are offering for sale a spurious article, under the name of "Silver's Patent Packing." Purchasers are requested to see that every Box bears the Trade Mark of S. W. SILVER and Co., Works, North Woolwich.

TESTIMONIALS.

"Commercial Mills, Cornbrook, Manchester, Oct. 6, 1854.

"GENTLEMEN,—We have used your Packing for some time in our steam-engines, and have to state that we find it efficient and economical, and to be much superior to the ordinary hemp packing. It is certainly one of the most reliable valves we have ever had. Yours truly, "HOWARD and WARD, Engineers."

"Works, Stratford, Jan. 29, 1856.



"I have pleasure in stating that the Packing of Messrs. S. W. Silver and Co. is fully answering my expectations, and I have also used it on board the steam-ships of the Company, to their entire satisfaction. "J. BEARDMORE, Engineer,

"General Steam Navigation Company."

Copies of further testimonials forwarded upon application to S. W. SILVER and Co., Nos. 4 and 5, Grand-parade, Within, opposite the London Tavern.

Specimens at the Hardware Court, Crystal Palace, Sydenham.
Illustrated Price-catalogues post-free on application.

IRONMONGERY,
PFEIL AND STEDALL.
THE LARGEST STOCK AT
THE LOWEST PRICE,
5 AND 6, BROAD-STREET, BLOOMSBURY.

LLOYD'S MARBLE WHARF, Thames-bank, Pimlico, adjoining Vauxhall-bridge.—Italian Statuary, Veined, Sicilian, Dove, Sienna, and other Marbles, for Sale at import prices. A resident manager on the wharf at all hours.

BUILDERS! ARCHITECTS! AND MASONS!
MARBLE.—The Italian Marble Company call the particular attention of Builders, Architects, Sculptors, and Masons to their PRESENT low prices, viz.—
Veins, in blocks of ordinary dimensions, 8s. 6d. per foot cube.
Sicilian " 6s. 6d.
An inspection of their well-assorted stock is solicited, at "The Depôt," Bridge-wharf, Millbank, adjoining Vauxhall-bridge.—Apply only to Mr. BAXTER, Wharf Foreman.
WILLIAM W. BUNNIN, Secretary.

MARBLE CHIMNEY-PIECES.—The nobility and gentry of the United Kingdom who are building or refitting their mansions are respectfully invited to inspect the most Extensive Collection of MARBLE CHIMNEY-PIECES lately imported from the Continent. They comprise Statuary, Giallo di Sienna, Vert Rouge, Dove, Black and Gold, Rouge de Belmont, Bardiglio, and other choice foreign marbles, and are designed with great taste, and executed by first-class artists.—On sale, in the show rooms of Messrs. EVANS, SON, and CO. King William-street, London-bridge.

MARBLE WORKS by PATENT MACHINERY, Commercial-road, Pimlico, London.
THOMAS JACKSON begs to draw the attention of the public to the most extensive stock of Marble Chimney-Pieces in the Metropolis; consisting of a selection of upwards of two hundred, and manufactured by steam power from the finest Italian and of foreign marble, and with that careful attention to the details and finish so necessary in good marble work. The Stock consists of elegant Drawing-Room Chimney-Pieces in Statuary Marble; bold, massive Chimney-Pieces, in Black, Black and Gold, Bardilla, Sienna, Verd Antique, Brocatella, Dove, St. Ann's, and Serpentine Marble, suitable for Dining-Rooms, Libraries, Vestibules, and Entrance-Halls; and a great variety of others in Veined, San Juan, Emperor's Red and Amber Marble, for Boudoirs, Breakfast-Rooms, best and secondary Bed-Rooms, &c.; also, Monuments, Tombs, Tablets, and Pedestals for Busts and Statues, and Slabs for Cabinet Work, &c.; the whole executed from the most classical designs, and in all the varieties of the finest Italian and British Marble, at the lowest remunerative prices.

PURBECK MARBLE can be had of Mr. JAS. VOSS, Corfe Castle, Dorset.

TO SCULPTORS, STATUARIES, MARBLE MASONS, and OTHERS.—A good opportunity is offered to enter upon an old establishment, as the proprietor wishes to retire, and will give every information. The business has been carried on successfully for forty-four years. Apply to Mr. PLOWS, Foss-bridge, York.

N.B.—A large number of Marble Chimney-pieces, Tables, other Work, and Stock, offered for Sale considerably below trade prices. Also, either together or separately, a Stone Wharf, Stock, Shops, and Premises.

RANSOME'S SILICIOUS STONE.—All kinds of ARCHITECTURAL EMBELLISHMENTS executed in this beautiful and indestructible material, at prices not exceeding the ordinary cements. Full particulars furnished on application to Mr. FRED. RANSOME, Whitehall-wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich.

BRAMLEY FALL! BRAMLEY FALL! On account of greater facilities than possessed by any one else, TRICKETT and PERKINS are prepared to supply in any quantity BRAMLEY FALL STONE, at greatly reduced prices, having opened the extensive quarries in the Hawkesworth Cutting, on the North-Eastern Railway, near Horsforth. The stone is of the same quality as the well-known Old Bramley Fall and Horsforth Quarries, but has the advantage of being of a lighter and more uniform colour. The North-Eastern Railway Company have put sidings in on both sides of the railway. Powerful cranes are fixed, so that the stone can be got to any size, and the stone being landed in the quarries on the railway-trucks, can be forwarded the same day to any part of the kingdom, or supplied in London river via Selby or Hull, in any quantity.—For particulars apply to JOHN TRICKETT, Stone Merchant, Headingley, near Leeds, or to SAMUEL TRICKETT, Victoria Stone Wharf, Isle of Dogs, London.

BANGOR WHARF, King's-road-bridge, Camden-town.—STRINGFIELD and COOPER, late W. W. Rawling, beg to call the attention of Builders and others to their stock of Bangor slates, laths, plaster, Roman, Portland, and Keene's cement, blue lias, Dorking and chalk lime, plasterers' hair, Yorkshire plain, pan, and ridge tiles, glazed sewer pipes, closet-pans, and traps, Welsh fire-bricks, gravel and shells for garden paths, ballast, sand, &c. Materials landed, wharfed, and carted.

QUARRY WORKED STONE.—Architects, Masons, and Builders would effect a great SAVING in cost by ordering bases, plinths, templates, cills, corbels, imposts, cornices, copings, steps, staircases of all kinds, moulded or plain, square or spandril, from the quarries ready worked for fixing. Experienced foremen are kept, and the stone is clean worked, and carefully packed or stowed, and delivered direct in one bottom by vessel or railway truck.—Prices and every information given on application, accompanied by plans or sketches, to SAMUEL TRICKETT, Stone-wharf, Isle of Dogs, or to JOHN TRICKETT, Headingley, Leeds, Yorkshire.

ANCASTER STONE. JOHN WILSON begs to inform Architects, Builders, &c. that having introduced additional and powerful MACHINERY into the ancient Ancaster quarries, he can contract to supply large quantities of STONE, daily. The durability of the ancient Ancaster stone (which has been extensively used in the erection of churches, mansions, factories, &c. and has for centuries withstood all atmospheric influence), also the great saving of labour in working, are too well known to need much comment.—Address, Mr. JOHN WILSON, Station-road, Grantham.

GRANITE.—King William and Nelson Monuments, Plinth and Steps of the Royal Exchange, and Terraces at the Crystal Palace.—Supplied by the Haytor Company under Royal Charter.—For terms, apply to Mr. C. HOAR, Haytor Granite Office, 4, Millbank-row, Westminster.

GRANITE.—The Cheesewring Granite Company, Liskeard, Cornwall.
London Agents—TREGELLES and TAYLOR, 54, Old Broad-street. Manager—JAS. J. TRATHAN, Liskeard
This Granite is selected for the New Westminster-bridge.

WELSH GRANITE.—The Welsh Granite Company, Carnarvon, supplies Pitching or Paving Sets of this Material to order. The Sets, which have for several years been extensively used in Manchester, Bristol, and other large towns, combine in a higher degree than any others, the qualities of roughness in wear and durability. The stone is also well adapted for foundation courses, plinths, &c. for public buildings and for mill-stones; it will also take a fine polish.

GREEN MOOR STONE WHARF.—BROWN and BOOTH, 42, Bankside, Southwark, beg to invite Builders, Architects, Masons, and the Trade, to the stock of STONE of all kinds; viz. Portland, Ganzeby, Harehill York Paving, Landings, &c. &c.; the Green Moor stone in blocks, landings, quarry-worked steps, sinks, copings, cills, &c. &c. Sawn slab and headstones in Green Moor, Harehill, Robin Hood. The best attention given to all orders, and price-lists sent on application—at such prices to suit the wishes of all. The nearest wharf to the City and Surrey side of the water.

CAEN and AUBIGNY STONE.—P. FOUCARD, Stone Merchant and Quarryman. Cargoes shipped to order from Caen to any port. Contracts taken for any quantities. Depôts: Granite Wharf, East Greenwich; Lett's Wharf, Waterloo-bridge. Office: 346, High-street, Southwark, near the Townhall.

GATES and GEORGE, CAEN, AUBIGNY, and GENERAL STONE MERCHANTS, CAEN WHARF, ROTHERHITHE, LONDON.

MARKET-WHARF, REGENT'S-PARK-BASIN.—WEST-END DEPOT, for Yorkshire Paving, Portland and Derby Stone, Bangor Slates, Slabs, &c. Also Bricks, Lime, Cement, Plaster, Tiles, Laths, and Fire Goods. SCOLES and WOOD invite the attention of Builders, Masons, and others, to their Stock as above, where everything will be charged at the lowest prices. Headstones, Ledgers, Steps, Landings, &c. cut on the shortest notice. Country orders promptly attended to.

JOHN BAZLEY WHITE and BROTHERS, MARBLE MERCHANTS, MILLBANK-STREET, WESTMINSTER. Marble of all kinds and of best quality, in block and slab, Marble mortars, &c.

STONE! STONE! STONE!—To the TRADE.—The cheapest pieces in London for Portland and Bath Stone, Yorkshire Landings, Steps, Curb, Paving, Sett-and Slab, Granite Pitching and Curb, Guernsey broken Road Materials, and every other description of stone, at JOHN KNIGHT and SONS', Devon Wharf, Mile-end. York tooled paving, 3s. 6d. per 100 feet; slab for hearths, 4d. per foot sup.; slab for chimney-pieces, 9d. per foot sup.; 8 by 3 window-sills, 6d. per foot run; 13 by 3 coping, 6d. per foot run; box chimneys (any opening), 8s. 6d. each. Terms cash on delivery.

ROWLEY RAGSTONE and YORKSHIRE STONE, for paving and road making, at GEORGE C. RYLAND'S, Hailstone Wharf, Crescent, Birmingham. Paving executed by experienced workmen. Board of Works and Contractors supplied with Ragstone direct from the quarry.

GAZEBY STONE from the original Quarries, in blocks and steps. 2,000 feet cube in stock at BROWN and BOOTH'S, 42, Bankside, Southwark.

TO CONTRACTORS AND OTHERS.
YORKSHIRE PAVINGS, LANDINGS, STEPS, COPINGS, CURBS, SILLS, SINKS, and CHANNELS; Hare-hill, Robin Hood, Park Spring, and Gayby, in Blocks, Headstones, or Slabs; Purbeck Paving, Sinks, Curbs, Rickstones, Pitchers, and Squares; Caithness Flags, Firestone, Newcastle and Bilston Grindstones; Portland Stone in Blocks, Landings, Slabs, &c.; Darley Dale, Caen Stone, Bramley Fall, Bath, Huddlestone, Park-wood, and other Block Stones. Valentia Slate Slabs, Bangor Slates, Cornish, Aberdeen, Guernsey, and other Granites; Marble, in Block and Slabs, supplied from the Wharfs, Millbank-street, City Basin, and Deptford; also direct from the quarries by vessel or rail.—Address, FREEMANS WHARF, 37, Millbank street, Westminster.

BATH STONE.—HENRY STONE, having understood that some parties have been offering for sale a sort of stone, calling it Hampton Down, H. S. begs to inform Architects, Builders, and others, that he is the only person that can supply that article. Having, about two years since (at a considerable expense) reopened the well-known Hampton Down Quarries, he is happy to state that he can now supply that stone to any extent. Since opening the quarry, H. S. has supplied a considerable quantity of it to several churches and other public buildings. COMBE DOWN and BOX GROUND WEATHER STONE on the most reasonable terms. Residence, WIDCOMBE, BATH. Cargoes shipped and delivered to any part round the coast.

BATH STONE OF BEST QUALITY.
RANDELL and SAUNDERS, QUARRYMEN AND STONE-MERCHANTS, BATH.
List of prices at the quarries and depots, also cost for transit to any part of the kingdom, furnished on application to Bath Stone Office, Corsham, Wilts

AMERICAN OILSTONES, superior to all other Oilstones for sharpening Edge Tools. Can be cut to any shape or size. AMERICAN OILSTONE DUST, 2s 6d. per lb. Patentee of the Emerald Ratchet Drilling Brace, from 21s. Each. JOSEPH PENN, Tool Manufacturer, 105, Newgate-street, London.

PARIS EXHIBITION.—ENAMELLED SLATE.—TWO FIRST-CLASS MEDALS! Mr. MAGNUS is the only exhibitor whose productions received this double honour; also the Prize Medal at the Great Exhibition of 1851, and the Medal of the Society of Arts in 1852. This beautiful material, handsomer and more durable than marble, is now finding its way into palaces, into the mansions of the nobility at home and abroad, into the highest class of public buildings, as well as into humbler dwellings. The cost is unusually below that of any other production that can at all compete with it. It is applicable to a variety of useful and ornamental articles, too numerous to be separately specified. Among the chief are chimney-pieces and ornamental stoves for all apartments; plain and exquisitely decorated slabs for the tops of lavatories, chiffoniers, consoles, &c.; baths, baptistries, altar-tablets, pilasters, columns, vases, pedestals, and brackets; wash-stand tops, billiard tables, linings to halls, vestibules, and dairies.—Price lists can be had on application to Mr. MAGNUS, 7, Smallfield-place, Upper Belgrave-place, Pimlico.
N.B. Plain slate work executed from a single article to the most extensive contracts, for home and abroad.

VALENTIA SLATE SLABS.—The Valentia Slab Company invite attention to their Slabs now supplied, of very large dimensions and of superior quality. They have been used at the British Museum, National Gallery, Bethlem Hospital, various Lunatic Asylums, the Ordnance Works, Model Prison, Pentonville, and other Penitentiaries; Maltins Floors in Bedfordshire and Hertfordshire, Breweries, the Race Stand at Brighton, Portsmouth Barracks, and are kept in stock in large quantities by Messrs. FREEMAN, Millbank-street; and at Messrs. Brabys, Belvidere-road, where terms may be obtained.

SLATE.—The Bangor Royal Slate Company have now on hand a LARGE ASSORTMENT of ROOFING SLATES, blue and green, of the usual sizes, which they are prepared to supply on the usual terms, for shipment from their depôt at Bangor, or to forward by railway. Also Slabs of all sizes. Orders to be addressed to Mr. EDWARDS, Manager, Royal Slate Quarries, Bangor

SLATES.—For immediate SALE, at J. CULVERHOUSE'S, Kentish-town Wharf, Kentish-town, a large quantity of best quality SLATES, all sizes, for cash. Also, best Stock, Grisell, and Place Bricks, Sand, Ballast, Gravel, Flint, Guernsey, and Bombay Granite, Carting, &c. at equally low prices. Any quantity of roads made by contract.

ROOFING SLATES or Covering, Slate Cisterns, Sinks, and every description of Slab-work in Slate. Builders will find they are consulting their own interests in forwarding their orders to T. B. HANNAFORD, inasmuch as they not only can rely on first-class materials and workmanship, but their prices are as low as to be entirely unapproachable.—Trevalga Wharf, Ratcliff cross

ASPHALTE.—GERVASE FOOTTIT TRINIDAD ASPHALTE WORKS, ROTHERHITHE, LONDON. Established 1838.—TRINIDAD, SEYSSEL, and BRITISH ASPHALTES, manufactured by Steam power, laid down in the best manner, or supplied in any quantity. Information for using forwarded with materials. Post-office orders or reference in London promptly attended to.—Estimates given for every kind of the above work.

ASPHALTE.—THOMAS HARRISON, having completed his works for making by steam-power, is now in a position to execute orders for BLOCK ASPHALTE to any extent, at an hour's notice. Asphalte expressly prepared for barn and granary floors, and every description of agricultural buildings, for laying which plain instructions will be forwarded. Estimates given for every variety of Asphalte Pavement, Manure and other Tanks, Sea-Walls, Railway work, &c.—The trade supplied on advantageous terms.—THOMAS HARRISON, Asphalte and Matting Works, Cambridge-heath Wharf, Hackney; and Sunderland Wharf, Rotherhithe.

ASPHALTE, FOREIGN and BRITISH, for FLAT ROOFING and every description of PAVING, especially in damp situations.
FROM 2s. 9d PER SQUARE YARD.
Country Builders supplied with Asphalte for footings and barn floors, with instructions for using it.
Apply to JOHN PURRINGTON, Poloneeau and Limmer Asphalte Office, Monument-chambers, 14, Fish-street-hill, London
N.B. Importer of the PURE ROCK ASPHALTE, from the LIMMER Mines in Hanover.

O. M'CARTHY, CARMAN, and SAND and CEMENT MERCHANT, Whitefriars Wharf, White friars, Fleet-street, Cits. Sand, from above or below bridge, delivered by the yard or per barge. Ballast screened or unscreened, by the yard or per barge. Stocks, lime, and old bricks. Dry rubbish delivered per barge, in any quantity, alongside the Thames.

NOTICE TO ROAD CONTRACTORS, NURSERYMEN, AND OTHERS.
W. and J. STUDDS, Sole Proprietors of the WEST DRAYTON GRAVEL PITS, lately removed from No. 21 Wharf, Harrow-road, to 9, North Wharf-road, Paddington, have now on sale good Garden and Screened Gravel. For terms, &c. apply at the Wharf.
Contractors supplied to any extent.

FURTHER REDUCTION of PRICES.—SAMUEL PUTNEY has much pleasure in informing his numerous friends that he has made a further reduction in the price of Pine Planks, &c. and respectfully solicits an inspection of his large and well-selected stock of Deals &c.

Pine Planks, 12 feet by 3 in. by 11 in. from	£21	0	per 120.
Yellow Battens, from	11	10	"
Yellow Deals, from	20	0	"
Spruce Deals, from	18	0	"

Prepared Flooring, &c. equally low. A list of prices forwarded on receipt of a postage stamp.—N.B. All sawn goods delivered within two miles free of cartage.—Borough-road, southwark, and Elm-street, Gray's-inn-lane.

FLOOR BOARDS, &c.—R. SLADE begs to inform Builders and the Trade, that he has now on hand a large assortment of FLOORING and MATCHED BOARDING, from ¾ inch to 1½ inches thick, seasoned, and ready for use; also, Mahogany, Moulding, Wainscot, and all kinds of Timber required for Building purposes.—Address, R. SLADE (late E. Simms), Flooring Manufactory, Wilton-road, Pimlico.

ALFRED ROSLING begs to inform his Customers and the Building Trade generally, that he is enabled to allow a discount of 15 per cent. upon his list prices for Mouldings.—A large stock of dry flooring at low prices.—Southwark-bridge Wharf, Bankside.

MACHINE CARVING WORKS (Patent). Ecclesiastical and every other description of CARVING. A magnificent Gothic Screen, Carved Glass Frame, and other specimens of Tables, Chairs, Lanterns, &c. Designs and estimates at the Works, Belvedere-road, Lambeth, foot of Hungerford-bridge.

MAHOGANY and WAINSCOT seasoned by Symington's New Patent Process.—JOHN COUMBE submits an inspection of his stock. The above process enabling him to season his wood in a comparatively short space of time, he sells at prices generally charged for wet wood.—Address, PATENT WOOD SEASONING WORKS, Lady Lake's-grove, Mile end-gate.

ANOTHER GREAT REDUCTION.—Yellow Deals, 3s. 3d.; Pine Plank, 3s. 6d.; Spruce Deals, 3s.; Mahogany, 6d.; 2½ Yellow Battens, 12l. 10s.; F. Walnut, 7d. Cartage free in town.—T. FORMAN, 1, Walnut-tree-walk, Lambeth-walk.

NOTICE of REMOVAL.—EDWARD SIMMS begs to inform his customers and friends that he has REMOVED his business from Wilton-road, Pimlico, to the KING'S-ROAD, CHELSEA, where their orders will be promptly executed as heretofore.—Please address, E. SIMMS, King's-road, Saw-mills, Chelsea, opposite Manor-street.

EDWARD SIMMS begs to inform Builders and the trade, that he has now on hand at his manufactory the first of its kind ever established, a large assortment of PREPARED FLOORS and MATCH BOARDING, seasoned and ready for use, from ¾-inch to 1½-inch thick, in White or Yellow Deal, Oak, or Pitch Pine. Also Dry Deals, in all thicknesses, Slating Battens, Fantic Laths, Oak Sills, Plank, and Scantlings. Mouldings in clean Pine, to any design. A pattern list forwarded on application.—Address, E. SIMMS, Flooring Manufactory, and Sawing, Planing, and Moulding Mills, King's-road, Chelsea.

ONE HUNDRED LOADS of BEST PETERSBURGH CEILING LATHS for SALE, price 33s. nett, and TWENTY-FIVE LOADS of ditto, 38 inches long; Ceiling Ditto, 30s. per load; nett; and some thousand tons of Blue Elvin GRANITE for Macadamizing Roads, for Sale. A sample may be seen at Mr. T. NEWTON'S Wharf, Hertford-road, Kingsland-basin.

MOULDINGS BY MACHINERY. Capping, Sash-bars, Beads, &c. to any Design, carefully packed and sent to all parts of the Country. A Pattern List sent on application to
E. SIMMS,
SAWING, PLANING, AND MOULDING MILLS,
KING'S-ROAD, CHELSEA.

PATENT SOLID SWISS PARQUETERIE. This beautiful, unique, economical, and elegant description of Floor, so extensively used in Paris and other continental cities, is now introduced into this country—an extensive assortment of specimens and patterns commencing at 1s per foot superficial, together with every particular of its cost and adaptation, can be obtained of Messrs. H. P. BURT and CO. 3, Charlotte-row, Mansion-House; or of Messrs. ARROWSMITH and CO. 80, New Bond-street.

ACORN TIMBER WHARF and SAW MILLS,
CANAL BRIDGE, OLD KENT-ROAD, LONDON.
A Monthly Price Current forwarded on application.
RICHARD MAY, Proprietor.

LETT'S WHARF PATENT SAWING, PLANING, and VENEER KNIFE-CUTTING MILLS, Commercial-road, Lambeth. The Proprietors beg to announce to the Trade that they have completed their extensive arrangements, and will be happy to execute all orders entrusted to their care with despatch and punctuality. Wet and dry docks, and powerful cranes for landing heavy goods, offer facilities not to be obtained elsewhere. A large assortment of seasoned prepared flooring and boarding, &c. &c. always in stock at reduced prices.

ST. PANCRAS SAWING, PLANING, and MOULDING MILLS, Canabridge-street, Old St. Pancras-road.—GEORGE NOKES and CO. invite the attention of Builders and the Trade generally, to their STOCK of DRY FLOORING, at the following prices, for cash:—
¾-inch white, 13s. 6d. per square; ¾-inch white, 15s. per square; 1-inch white, 18s. per square; ¼-inch yellow, 15s. per square; ¾-inch yellow, 16s. 6d.; 1-inch yellow, 20s.
Timber, deals, planks, &c. at the lowest remunerative prices. A liberal discount allowed on mouldings for exportation. Book of designs forwarded on application.

SUN SAWING, PLANING, and VENEER-CUTTING MILLS, Canal-road, Kingsland road.—A. COX and SON beg to call the attention of Builders, Timber Merchants, and the Trade in general, to the above Mills, and to the facility they afford them. They are now prepared to execute any amount of work with promptness and despatch, at the lowest possible prices. Full particulars may be obtained on application by post or otherwise.
The Premises abut on the Regent's Canal, and afford every facility for landing and piling goods.

TO FRENCH POLISHERS, CABINET-MAKERS, BRASS-WORKERS, &c.—A considerable reduction has taken place in the prices of French polish, white and brown hard spirit varnishes, spirit lackers, and finishing spirit. The present price is 8s. to 8s. 6d. per gallon; white French polish, 10s. per gallon; white shellac, 1s. 8d. per lb.; gums, shellacs, and acid at the lowest prices. A net cash list forwarded on application, to JAMES SLIPPER, 87, Leather-lane; and 13 and 15, Dorrington-street, Holborn, London.

STAINING DEAL TO IMITATE ALL KINDS of WOODS. It requires NO SIZING, and will stand the exposure to the weather. Price 8s. per gallon. Wash for W. NAYLOR'S Stains may be had at the Factory, 44, James-street, Oxford-street; also Manufacturer of Improved Knotting and Decorative Varnishes.

PAINT, certified by the Government Engineers and Contractors to be the CHEAPEST and BEST ever discovered for wood and iron, price 35s. per cwt.—Apply to the London Anti-Oxyde Paint Company, D. WALKER, Secretary, 29, New Bridge-street, Blackfriars.

TO PAINTERS, BUILDERS, &c.—LIVETT, FRARR, and SON, No. 14, Borough, London-bridge, respectfully call attention to their Stock of Linseed Oil, which they quote their present prices for cash—Linseed oil, 3s. 3d.; boiled 3s. 6d.; turpentine, 2s. 8d.; oak varnish, 7s. 6d. per gallon; genuine white lead, 30s.; second quality, 31s.; best town glue, 45s. per cwt.; colours, brushes, &c. equally low. Lists of prices on application.

KENT'S PAINTING-BRUSHES are of the very best quality, and may be obtained at all the first houses in the trade, and of the manufacturers, G. B. KENT and Co., Great Marlborough-street, London. Established 1777.
N.B. Kent's Painting Brushes are all stamped G. B. KENT & CO.
Price Lists forwarded by post.

BEST PAINTING-BRUSHES.—J. B. TYLOR, Practical Brush Manufacturer, 3, Jermyn-street, Haymarket, London, begs to call the attention of the Trade to his Brushes and Tools, both Metal and Stump Sash, which, for these articles, he has been awarded the only prize medal given for the best goods, and recommends as a superior article. Price Lists forwarded on application, post free.

GRAINING by MACHINERY.—The present system of graining for carriages by the use of BELLAMY'S PATENT GRAINING MACHINE, by which any person can produce the best possible graining in imitation of rosewood, mahogany, oak, walnut, &c., in a few minutes, and with the greatest facility. Price 12 guineas, including all three of the above woods.
Graining paper in imitation of all kinds of fancy woods of the choicest description, in the piece, or to suit for panels, &c., wholesale and for exportation. Public attention and cards of the trade in general solicited.
Decorative Decorators, Decorators, Merchants, and others are respectfully requested to inspect the patterns, and see the process at the Company's rooms, 34, Monmouth-street, London.

WOLSTON'S TORBAY IRON-PAINTS, warranted to stand the action of the Atmosphere, Steam, Gases, Acids, Vapours, Damps, and Salt Water, also intense heat will not destroy. These Paints have been tested for two years in Her Majesty's Dockyard, and two ships all their composite timbers, which have been painted with Wolston's Iron Paint, will effectually cover as much surface as 3 lbs. of either White or Red Lead and Oil, and are more economical, as they require less Paint. For all Iron Works, Bridges, and for Iron Railing, Fencing, Shipping purposes (Wood or Iron), Stucco and Cement Buildings, Roofs, and dull Colours will be found most suitable. Builders and Painters, for all priming purposes, the saving will be immense. May be secured at the TORBAY IRON PAINT and ORE WORKS, Brixham, Devon; London Depôt, Chamberlain's Wharf, Letters or orders addressed to Mr. WOLSTON, at the Works, or No. 34, John-street, Bedford-row, will have immediate attention.

In the Press, and will shortly be published, a book that has been long wanted by all parties having dealings in Land,
LANDED PROPERTY: its Sale, Purchase, Improvement, and General Management; containing plain and practical information for the use of Landowners, Land Agents, Surveyors, Auctioneers, Builders, Architects, Solicitors, Estate Managers, Stewards, Bailiffs, and others connected with the Transfer, Improvement, and Management of Landed Property.
By FRANCIS ROSS, Architect and Surveyor, 34, Moorgate-street, City.

Third Edition.
THE BUILDER'S FRIEND, by the SURVEYOR.
Office of "The Builder," and of all Booksellers.

ALWAYS on SALE, a large COLLECTION of BOOKS relating to ARCHITECTURE, CIVIL ENGINEERING, the FINE ARTS, &c. at greatly reduced prices.
By BAGELAY BENSON, Bookseller, 11, Henrietta-street, London.
Catalogues forwarded gratis.

CHUBB'S ILLUSTRATED LIST of CHUBB'S FIRE-PROOF SAFES, CASH BOXES, and WRITING DESKS, with Prices, sent free by post on receipt of two stamps.—Apply to CHUBB and SON, 57, St. Paul's Churchyard, London.

BUILDING LAND TO BE LET, at HALLS-HILL, Term 1000 years, for small cottages.
CANNING TOWN ... 99 ... for small cottages.
NORWOOD ... 99 ... for small residences.
STRATFORD ... 500 ... for small cottages.
POPLAR ... 98 ... for fourth-rate houses.
Advances 7d to 9d, at 5 per cent. on each cottage.
Apply to Mr. Wm. ELLISON, Architect, Stansby-road, Limehouse.

STRATFORD, ESSEX. — FREEHOLD LAND, within three miles of London, exempt from land-tax and free of tithe. TO BE LET, on Lease, for a long term of years, in piece or small plots suitable for manufactories or building purposes.—Apply to Mr. W. H. DEAN, Auctioneer and Surveyor, Stratford; or to Mr. GEORGE POWNALL, surveyor, 37, Bloomsbury-square, London.

NEW WINDSOR ESTATE. — Valuable BUILDING LAND TO BE LET, in Plots for first-rate and class Villa Residences, with Stabling, which are much needed in the locality. The situation is unsurpassed for beauty, and commands the best and most extensive and splendid view of the Castle. Within ten minutes of the Great Western and fifteen minutes' walk of the South Western Railway Stations. Application may be had by respectable parties.—For particulars apply to Mr. WILLIAM SIM, Architect and Surveyor, 2, Douglas-place, Strand.

VALUABLE SITE for BUILDING, TO BE LET, or SOLD.—The Directors of the Western Bank of London are prepared to receive TENDERS for the SURPLUS BUILDING GROUND, in BROOK-STREET, adjoining the Bank premises, in Hanover-square.—Plans may be seen, and application to be made to Messrs. RAMSAY, MURRAY, RYMILL and JACKSON, 17, Hanover-street, Hanover-square, to whom the Tenders may be addressed.

FREEHOLD LAND TO BE LET, on Building Lease for ninety-nine years. Money advanced to responsible parties. Freehold Land to be Sold for building purposes in eligible situations.—Apply at the Offices of Messrs. MORGAN and PHILPSON, Architects, 3, Dacres-inn, St. Clement's Strand.

TO BUILDERS AND OTHERS.
CLAPHAM-COMMON.—TO BE SOLD or LET, with the option to purchase on leasehold, FREEHOLD LAND in this very superior and healthful country village, suitable for the erection of villa and other first-class residences.—Apply by letter, post paid, to A. B. care of Mr. Evans, Stationer, &c. Clapham Old Town.

FINCHLEY.—LAND fronting the Regent's Park-road, and East-end-road. TO BE LET on Building Leases for nine-and-nine years, with power of enfranchisement. Plots from one to four acres for large villa residences; smaller plots for semi-detached houses, and plots for shops in the village. Apply to W. A. BOULNOIS, Esq. Architect, 6, Waterloo-place, Pall-mall, or to Messrs. BARKER, BOWKER, and PEARL, 1, Grayson-square.

BERKHAMPSTEAD. — FREEHOLD LAND. TWELVE PLOTS for SALE, a splendid villa of moderate size; and situation and aspect rarely equalled. A first-class railway ticket for twenty-one years is offered to persons building houses of a suitable character, and of the value of 50l. a year. The Free Grammar School also affords very great advantages to residents.—For a plan of the land and further particulars, apply to Mr. BALDWIN, High-street, Berkhampsted.

PERPETUAL INVESTMENT, LAND, and BUILDING SOCIETY.—Shares issued, 10,000. Interest on real Securities, 5½ per cent. Moneys duly received on Deposit or Shares, Interest paid half-yearly. Money ready for advances on houses or lands. No legal charges to Borrowers. Apply for particulars to the Secretary, Mr. J. E. TRESIDDER, at the Head Offices, 37, New Bridge-street, London.

TO COMPANIES with limited Liability, BUILDING SOCIETIES, and Others.—TO BE LET, on lease, for a long term, with immediate possession, extensive MANUFACTURING PREMISES, with good wharfage, excellent working-sheds and warehouses, and stabling, steam power, the whole of which are of a substantial character, and comprise the following buildings, all in good repair, and partly fireproof:—Gatekeeper's lodge, weighing-house, casting-house, with lofts; two counting-houses, an extensive range of well-built and commodious workshops and warehouses, engine house, boiler-house, and chimney-shaft. In the rear of the premises is now a good walled garden; there are also several excellent open and enclosed yards, and the premises abut upon the Limehouse-cut, with the advantage of extensive wharfage. These premises are situate at the eastern end of Copenhagen-place, Limehouse, near the church and the railway station, and forming part of an estate of 70 acres, now coming into use as building land; are available and well situated for sawing and planing mills, Stone, slate, and brick merchants, or for warehousing purposes requiring a deep landing. For further particulars apply to Messrs. BEADEL and SONS, 25, Gresham-street.

TO BUILDING SOCIETIES and SPECULATORS.—A few ACRES of very desirable METROPOLITAN FREEHOLD LAND, with materials and sheds for building and other purposes, TO BE SOLD together, very cheap.—Apply to Messrs. WHITTINGTON, Land Agents, No. 2, Broad-street, City.

LEASEHOLD LAND TO BE LET, on Building Leases of 91 years, upon terms of most unusual advantages, where second and third rate houses are in great demand. Roads and sewers complete. Situation three minutes' walk, branching off and being a portion of Carlton-road, Maida-vale, Edgware-road, near by the Kilburn Toll-gate, and from whence omnibuses serve for town, passing Carlton-road about every ten minutes.—For particulars, apply personally, or by letter, post-paid, at Mr. LAY'S Office, 2, Somerset-terrace, Carlton-road.

DUNNING'S ALLEY, BISHOPSGATE-STREET.—TO BE LET, by TENDER, on a Repairing Lease, for a term of years by the Worshipful Company of Poulterers, FOUR MESSUAGES, STABLING, SHEDS, and PREMISES, which are let to quarterly, monthly, and weekly tenants.—Particulars may be obtained of W. H. SAWBRIDGE, Solicitor and Clerk of the Company, at Mark-lane.

BUILDING LAND, Wanstead-park, Essex. TO BE LET, on Building Leases, for long terms, several PLOTS of eligible description, in the Park, on the high ground, fronting the Broad Drive, and other roadways, which is just opened. Plans of the property may be seen, and all particulars and rents may be known on application to Mr. CLIFTON, Architect, &c. No. 5, Gresham House, Broad-street.

MERTON-ROAD, TOOTING. — TO BE LET for Ninety-nine years, with PREMISES TO BE BUILT on the CARR ASSOCIATION of TWO SEMI-DETACHED HOUSES, on the west side of the road, on a most eligible freehold building ground, in close proximity to the Tooting Station of the London, Brighton, and South Coast Railway, and but a few minutes' walk from the Tooting Station of the London and South-Western Railway. Each house will be supplied for the tenant with a pump of never-failing spring water. Plans of the property may be seen, and all particulars and terms known on application to Mr. CLIFTON, Architect, &c. No. 5, Gresham House, Broad-street.

EAST HAM and BARKING, ESSEX.—TO BE LET, on Building Leases, several desirable PLOTS of LAND, close to the Rising Sun Tea-at East Ham, and near the Station of Barking Primitive Street, about 15 feet. Well supplied for the Houses of from 20l. to 25l. per annum. For particulars apply to RICHARD NICHOLSON, Esq. Solicitor, 4, Old Palace-yard, Westminster; or to THOMAS SMITH, Esq. Solicitor, 5, Great-street, Bloomsbury.

BUILDING LAND at HATFIELD, Herts. TO BE LET, on BUILDING LEASES, several eligible PLOTS of LAND, near the Railway Station, fronting the high-road to St. Albans, and well calculated to supply the demand for Villa Residences in this healthy and rapidly increasing neighbourhood. For particulars, apply to RICHARD NICHOLSON, Esq. Solicitor, 4, Old Palace-yard, Westminster.

WATFORD, HERTS.—FREEHOLD LAND, in Church road, near the railway station, TO BE SOLD, or LET on Building Leases.—Apply to Mr. EDWARD WILSHIN, Wavs-ll Farm, Pinner, Middlesex.

WESTON-SUPER-MARE.—FREEHOLD BUILDING LAND for SALE, the whole close to, and entirely overlooking the sea. In the centre of the town, and adjoining the Pier, on the Hotwell Rocks, in new squares, terraces, and streets. Plans, &c. of Mr. PHILLIPS, Esq. West-super-Mare.

AN Architect and Surveyor may hear of a HOUSE and OFFICES, in a first-rate situation near Birmingham TO LET, and an introduction to two flourishing Building Societies and other business. A small premium required. Address, No 2, Cooper and Co., Birmingham.

A PLUMBER'S and PAINTER'S BUSINESS.—An old-established BUSINESS, producing a comfortable living, for the sum of 60l. including stock, lease, and utensils in trade.—Apply at the PAINT and WINDOW LEAD WAREHOUSE, 32, Tottenham-court-road.

TO CONTRACTORS, BUILDERS, BRICKMAKERS, and CAPITALISTS.—WANTED, as PARTNER, or otherwise, a Gentleman of business habits, to join in the Purchase, and carry on, a highly eligible old-established BRICK FIELD and BRICK WORKS, now in full operation. The advertiser is induced to seek for a partner solely in consequence of the great pressure of his business, which no longer admits of his own personal attention to it, as he is about to devote the profits derived from the business to the purchase of a Seat in Parliament, for which object he is now canvassing the borough. Any gentleman about to enter upon the above branch of business, possessing the requisite capital, and possessed of the other advantages of character and connexion, will find this a most desirable opportunity. Further particulars may be obtained, by principals or their solicitors, on application by letter, addressed to M. Y. care of Mr. Thomas Lewis, St. George's Chambers, High-street, Birmingham.

TO CAPITALISTS.—A Gentleman in possession of extensive QUARRIES of a peculiar description of STONE, which has been tried and approved for upwards of fifteen years in the paving of the carriage-ways, and has been certified by the principal Surveyors of the principal towns in England to be the best material ever used for that purpose, is anxious of FORMING a JOINT-STOCK COMPANY to extend its trade to the principal cities and towns in England, Scotland, and Ireland, as also upon the Continent. Inasmuch as nearly all the transactions of a joint-stock company would be direct with public boards, it is evident that there are few more safe and profitable employments of capital. Gentlemen willing to meet the views of embarking in an undertaking of this kind, will please to send in their name and address to Messrs. FREEMAN and HAWKS, Solicitors, Three Crown-square, Southwark, from whom any further particulars may be obtained.

WANTED, in an old-established Builder's business, a PARTNER, or otherwise, with 250l. A carpenter preferred.—Address to G. R. Office of "The Builder."

PAPER-HANGINGS.—The CHEAPEST HOUSE in London for every description of PAPER-HANGINGS is GROOMS' WHOLESALE WAREHOUSE, 52, GREAT PORTLAND-STREET, Oxford-street, where you can select from the LARGEST and MOST EXTENSIVE Assortment in the Kingdom, THIRTY PER CENT. CHEAPER than any other house in the trade. Builders, Decorators, Dealers, and large consumers will do well to visit this establishment.

PAPER-HANGINGS.—To BUILDERS, PAINTERS, and the TRADE generally.—TRUMBLE and CO. Manufacturers, Jersey, and Location of the trade to their immense STOCK of PAPER-HANGINGS, at No. 4, Oxford-st. cor. Lodge's Institute of Good Taste, Satins, Oaks, Marbles, Brocades, and Mantles, Screens, and Shades, being their own manufacture, can supply on the very best terms.

PAPER-HANGINGS. — JEFFERY, ALLEN, and CO. beg to inform the trade, they have a large assortment of Paper-Hangings of their own manufacture, of all qualities, and at very low prices. They confidently invite attention to their best papers, which, in price, style, and colouring, are equal to any that can be manufactured. J. A. and Co. are the sole proprietors of the Gutta Percha Paint, an efficient remedy for damp walls.—Factory, 115, Whitechapel; show-room, 500, Oxford-street.

PATENT TERRA-COTTA. Tracery for Parapets and Terraces, Mullions, Pinnacles, Moulded Bricks, Coats of Arms, Crosses, Label Mouldings, Friezes, Trusses, Vases, Balusters, Capitals and Bases of Columns, Paving, Facing Bricks, Coping, Sills, and Tiles for Stairs, Chimney Shafts, and Tops, and numerous other Articles, manufactured by J. M. BLASHFIELD, in Patent impermeable Terra-Cotta, at Mill-wall, Isle of Dogs; and sold at No. 1, Wharf, Praed-street, Paddington-basin.

CARTS, VANS, WAGGONS, LADDERS, BARROWS, &c.—Price Lists for the undermentioned may be had on application to
No. 1. Carts, Vans, Waggons, Drays, and Trucks.
No. 2. Wheels and Repairs.
No. 3. Ladders, Barrows, &c.
No. 4. Hire of ditto.
G. ELL, 3, Tottenham-court, and 9, Palace-row, New-road, St. Pancras, near the Hampstead-road.

The Builder.

Vol. XIV.—No. 707.

BRICK was the principal material for building with during the Mediæval period in many parts of Europe, and numerous effective and beautiful structures formed of it remain, especially in the north of Italy and the north of Germany. Attention is being awakened in this country to the capabilities of brick construction, partly as we are able to assert through our own endeavours, and we may hope before long to see good results.

There is no reason why bricks should not be used by us as effectively in architecture now, as in any country in any age. Bricks may be moulded and burned in a superior manner at this time; and colour—with or without glaze—may be added. For additional ornament there is terra-cotta, in which the highest art may be employed.

Architects are blamed, and not without cause, for repeating in modern times the details and elevations of buildings many centuries old: nothing has been forgotten, nothing learned. We hope this will not be the case in our brick revival. With improved means of manufacture, let us hope to have something new, but at the same time something appropriate, in brickwork. The student must learn from the past: he must study the buildings of the Italians from the times of the Romans, as also the admirable brick buildings to be seen in Germany. Some of our old county towns contain specimens of brick construction, the study of which is worth a pilgrimage: and there are many country mansions to which the same remarks will apply. The term "cunning" may with justice be given to the workers in brick of three centuries ago, as most of the mouldings and ornaments were cut by hand after the bricks were set,—and artistically cut too. It is not advisable, however, to recommend brick-cutting for imitation. All the mouldings and ornaments, to be enduring, should have an unbroken fire-skin surface when set. The moulding and ornament should be produced in the soft, or partially dried, material, before it is finally burned in the kiln.

In using bricks of various colours in the same building, the colour of the mortar for the beds and joints should be considered: cream-coloured bricks may be set in ordinary mortar, which is generally of that tone. The railway entrance at the Crystal Palace affords a good example. Red bricks should be set in red mortar, and so for other varieties of colour: there need not be any difficulty in making mortar of the required tints; pounded brick refuse mixed with mortar in place of sand will always give the tone of the brick to the mortar; and for pointing, cheap mineral colours may be added so as to match; smiths' ashes, ground with lime, may be made to give any shade of tone from grey to black. Mortar made either with pounded brick or with smiths' ashes is generally found to be stronger than if made with sand. The addition of mineral colours is also strengthening. There may be cases in which the architect wishes to have bricks of one colour and mortar of another colour,—as red bricks with white beds and joints,—cream-coloured bricks, with dark beds and joints; such work is common—too common; it may be seen in buildings, new and old. At the Crystal Palace railway station, with the example of light bricks and light mortar giving breadth, and therefore harmony, the red bricks are set in light mortar, and are "tuck pointed" beds and joints, with white "putty" mortar, breaking up the whole surface most painfully, as contrasted with the light-coloured portion.

The hiding of beds and joints is not advocated. We simply ask, that the architect shall not thoughtlessly throw away all chance of breadth and keeping in a front where colour is introduced.

There are many examples of buildings in which stone or marble, or both, are used with bricks. Such combinations may be advantageous, or they may be the reverse, accordingly as they are managed. Combinations of stone with bricks can only be made efficiently when used in courses or bands; each course or band being all brick, all marble, or all stone. Brick fronts with stone quoins, stone window-jambs, and stone mullions, in which there are several beds of brickwork to one bed of stone, do not make strong work. All mortars and cements either swell or shrink in setting; hence there is not that character of homogeneousness necessary to strength. Bricks should be set with bricks: there should be brick quoins and jambs. Stone should be set with stone, and should be backed up with stone in true course, if the building is to have durability.

The great constructive defect in much of the mediæval architecture consists in the builders having set stones on edge, to carry up or serve for several courses of wall-stone. Quoins, jambs, and mullions were reared up, having little or no bond; and from this cause many buildings have gone to decay. The oldest Roman and Norman towers now standing have no quoins, but equal courses; Lancaster Castle, Newcastle, and others, will serve as examples.

The oldest brick buildings have no stone quoins or other mixture of stone to break the bond and weaken the structure.

Many architects specify to have thin beds of mortar: the oldest buildings in existence (with some exceptions — Egyptian and Cyclopean) have thick beds of mortar. Many of the great buildings in Asia and in Europe have been constructed with thin bricks or tiles and thick beds of mortar—almost as much mortar as brick. The Romans understood the use of mortar, and did not spare it. The steam-engine and mortar-pan of our day will make better and stronger mortar than the Romans ever used. We can make better bricks too, and we ought therefore to make better and stronger work.

Do we?—Not exactly.

BRIDGE FOUNDATIONS.

NEW WESTMINSTER BRIDGE.

The completion of Rochester-bridge; the recent investigation into the sufficiency of the foundations of the New Westminster-bridge; and the growing want of adequate means of communication between different parts of this metropolis, combine to interest us in a review of some of the inventions and proposals made relative to bridge-building, and their special applicability to the River Thames and the convenience of London. The question as to Westminster-bridge seems now to stand with reference to what would be the best line of route for traffic, rather than upon the interests of holders of property, or of the shopkeepers in or about the approaches. The probable erection of Government offices, north of Bridge-street and Great George-street, is made an additional argument for reconsidering the matter of site. The problem of reconciling adequate headway with the effect of the Houses of Parliament (which last, it may now be conceded, should never have been rebuilt on so low a site), to some appears to point the same way. The wants of London, indeed, require all the new bridges that have been of late years talked about,—such as the bridge in line with Old Change; one between Hungerford-bridge and the present site of Westminster-bridge; and one higher up, from the Horse-ferry to Lambeth, as again proposed in the report of Messrs. Rendel and Simpson.

The actual site of Westminster-bridge does seem to be about the last line that should be selected, if we considered alone the direction of the traffic to it on the Middlesex side, and the interference of the traffic to the Houses of Parliament. It is not very satisfactory that such a conclusion as that which the committee have hinted at, could not have been made before 85,000*l.* and odd had been expended on an opposite basis; and we are leaving out of consideration the enormous expenditure upon this site within the last twenty years,—in works of maintenance which have proved abortive, and in works of extension to a ruinous structure, which have never been brought to completion. We will blame no one in this instance; but there is defective reasoning as to these ever-recurring cases, somewhere; for, as much is *wasted* about Government and public works in the course of very few years, as would bridge the Thames from Richmond to Blackwall, pay for two or three Houses of Parliament without one stiver taken from architect's remuneration, and provide for Government offices the grandest architectural work in Europe.

Since, then, the subject of bridge communication generally should receive increased attention; the subject of structural improvements in bridge-building is very important. We propose, however, to confine our present observations to the vital matter of foundations.

The method adopted at Rochester-bridge, and that used by the engineer of the Westminster and Chelsea bridges assume to supply good or better foundations than those of the old system, and save the enormous outlay of coffer-dams. At the same time, obstruction to the water-way is reduced,—in the construction of the bridge, by the absence of the dam,—and perhaps even in the finished pier and foundation.

The progress of structural science in bridge-building, we may remark, has been great in modern times—without referring to the use of iron in its various forms. The increase of span in arches is attended with a diminution of impediment to the stream, which must be considered as a great gain,—notwithstanding that unlooked-for changes have resulted in the case of the bed of the Thames,—from the very alteration at London-bridge,—which have caused serious injury at Blackfriars as well as Westminster, and, it has been said, at other bridges. In bridge-building, as in every kind of superior work, the aim is to provide liberally against all contingencies, though to do no more: but any principle of construction, however economical in appearance, in which the platform of foundations should be less permanent than in the best of the London bridges, would be ill-adapted to the river Thames.

The destruction of the piers of a bridge may arise from two chief causes. First, the ground on which they stand may be unsuitable, or the footings may go to such slight depth as to be undermined; and, secondly, the material itself of the piers may fail under the weather, and the various abrasions and concussions to which the piers of bridges are subject. But whilst the former is a radical defect in any system of founding, the second may be of sufficiently remote occurrence that economical reasons may be allowed to modify the design,—though even here it should be remarked that mistakes have been made, as in the use of timber for piers, now abandoned even where the superstructure is of the least durable material. The Select Committee on new Westminster-bridge, struck out a paragraph in their draft report, which went to state their opinion, that "it would have been more desirable to build a bridge of such importance over such a river, in the most permanent manner," though only by a majority of one. Mr. Tite was against the clause, Sir Benjamin Hall being for it. Allowing that "the changes that have taken place in the bed of the river, and in the flow and ebbing of the tides of late years, ought to have due consideration before determining the mode of construction, and the headway under the bridge," and that the witnesses examined (whose evidence is not yet published) "differed somewhat in opinion, as to the amount of any probable future change

in these respects," and even concluding that such a mode of construction as that adopted in the new Westminster-bridge, "is less permanent and secure than granite piers founded deep on the London clay, by means of coffer-dams," the committee, finding the piers could be repaired, yet attach due importance to the arguments that it is "less expensive, and can be carried out in a shorter period of time" than the coffer-dam system, as well as that it causes less obstruction to the river,—feeling also satisfied that the plan which was in course of progress at Westminster might in the main have been carried out, and that "the proposed piers would have been of strength amply sufficient to bear the weight proposed to be placed upon them." These conclusions were formed after hearing the opinions of the engineer himself (Mr. Thomas Page), and of Mr. Robert Stephenson, Mr. John Hawkshaw, and Mr. John Fowler, in addition to those of the reporters to the First Commissioner of Works, Mr. J. M. Rendel and Mr. James Simpson. The question in the case of Westminster-bridge is complicated by points connected with the foundations of the old bridge,—the removal of which, the reporters appeared to have considered would alone occasion a large outlay,—their ultimate conclusion having been that the system of foundations used in the new works was not only defective structurally, but did not provide, as coffer-dams would have done, in their opinion, for the safe, expeditious, and cheap removal of the foundations of the old bridge. The estimated cost of the bridge, as in progress, would be 224,228*l.*; whilst the estimate, with deeper foundations and piers differently constructed within coffer-dams, would be 326,000*l.* But the former estimate Messrs. Rendel and Simpson appear to think would be inadequate, considering the cost of removing the foundations of the old bridge: they would add on that score 40,000*l.*; so that the figures would then stand 264,228*l.* against 326,000*l.*—exclusive of 35,000*l.* for a temporary bridge in the latter case, and of the cost of approaches in both cases. Thus, assuming the highest estimate in one case, and the lowest in the other, Mr. Page's system would appear to cost 62,000*l.* less than the other, in the case of the present site,—whilst in ordinary cases there would seem to be a diminution of expense by the adoption of the new system, even greater in proportion.

Having thus probably shown the interest and especial importance now of the subject of bridge foundations, we shall not be deemed tedious if we succeed in describing more clearly than has been done, wherein presumed improvements consist.

The chief means available in bridge foundations have involved the application of platforms of timber, or fascines; concrete and "beton;" and timber piles,—to which of late have been added iron piles; and—still more recently—screw piles, and pneumatic cylinder piles sunk in different ways. Hitherto, two principal modes have been adopted in laying the foundations, where the stream could not be diverted, or use made of the diving-bell, or diving-dress. These methods have required the use of coffer-dams, or of caissons. The coffer-dam is a temporary structure circumscribing a water-space, and which being formed of piles and clay-puddling, will allow the water to be pumped out, and the bed of the river to be laid dry. Thus the foundations can be laid in the best manner: the soil can be excavated to any depth, and piling can be driven from that lower level. Such was the method adopted in the chief of the London bridges. At Westminster-bridge, however, in 1740, caissons had been introduced,—these consisting of what may be called boxes of carpentry, raised round a framing of timber upon which the pier was built,—the whole sinking till the bottom was reached—when the water was let in, and the sides were set free. In a modification of that principle, iron caissons are used,—the sides and bottom, however, in that case, being permanently attached; and this plan, we believe, has been adopted by Mr. Brunel and others with success. It must be seen, however, that whilst using caissons, the character of the bed of the river should be understood,—accurate *level* should be found, or made by dredging, and a *solid bed* should be procured at whatever depth. The use of boring tools would now offer facilities for this object, which were not at hand during the the original building of Westminster-bridge. It is impossible for us at present to inquire into all the varying circumstances which might affect the choice of one or other method of construction; or to ascertain whether, by the aid of the diving-bell and dredging, what seem to be disadvantages of the caisson system, could be so far overcome as to allow of its use generally. What, however, seems clear, is this, that a platform esteemed perfectly unchangeable during all time, has in all important cases been sought for—sometimes by excavation, till solid ground was reached; sometimes by the aid of the resistance which the sides of piles afford to their sinking, and sometimes by piling below an excavation—itself at great depth. The one serious error in any of the London bridges was committed at Westminster-bridge by Labelye, though in the means adopted rather than in the principle of the caisson,—for in 1838 or 1839 coffer-dams had to be formed, and the framed platforms of the piers protected from further subsidence by sheet piling driven around them.

It is obvious that although in other classes of works a foundation may be found at a lower depth, worse than one above, in bridge building depth is of peculiar importance, because of the eddies, and the current next the piers.

Either piles or concrete can form excellent foundations. But since the use of concrete was revived, it has been much the habit to regard it as a kind of talisman or shield against all otherwise defective construction arising in choice of foundations,—in short, as though any soil could be made to uphold any heavy structure by the simple interposition of a thin stratum of artificially compounded rock. Another application of concrete which has been made, is that of building with it above ground; but for this, its advantage is doubtful, if exposed to the weather—as with frost it gradually peels away and is destroyed. It has, however, been used extensively for the sea-wall at Brighton. We think it may be taken as an axiom, that concrete should not be employed in any critical position above ground unless faced with some other material. All these are points which, when we come to speak of the system used at New Westminster-bridge, it will be admitted should be taken into consideration. Of that system we have expressed no present opinion.

One of the earliest suggestions of the class of improvements in bridge-building to which we are now more especially referring, is contained in the specification of a patent granted to John Nash, the architect, in 1797. The patent is entitled, "A method of constructing bridges of plate iron, either wrought, cast, framed, or put together, so as to form hollow bodies, masses, or cubes capable of being filled up with earth, sand, stone, gravel, or other materials, to make the same solid bodies, masses, or cubes; or not being filled, have the semblance of solid bodies, masses, or cubes," &c. The proposed method as to the arch, consisted in the use of hollow iron boxes for the voussoirs or segments, which boxes might be filled as referred to in the title, or not. It did not attempt to positively dispense with the coffer-dam, or an inclosure intended to answer the same purpose as the ordinary one of timber and puddling. The "dam" was proposed to be formed "by piles of plate-iron, grooved, rebatted and dovetailed into each other; which when fixed into each other, form a hollow box; and when driven or inserted into the bed of the river, form a dam for the pier." After the pier was built, these piles were to be "driven home to the bed of the river," making "a box of dovetailed piles inclosing the ground on which the pier stands, and securing it from being undermined by the water passing through the arch." The piers were to be "hollow like the boxes" of the arch, and filled up solid, or not; and were to be of plate iron, either wrought or cast, and framed or put together; and they might be cast in one piece and of any form, or in several pieces, as cylinders, or squares, or triangles, on plan—which pieces might be cast with the hollow frame forming the piers, or be fastened to them, as in the drawings illustrating the specification, where the spaces are shown filled with masonry.*

In 1811 a patent was granted "to Samuel Bentham, esq. of Hampstead, civil architect and engineer of his Majesty's navy," for a certain invention of a secure, economical mode of laying foundations, and in some cases of proceeding with the superstructure of works,—particularly applicable to the projection of wharfs and piers into deep water, to the construction of bridges, harbours, and the erection of buildings in bad ground. The invention is not very clearly described in the specification,† but appears to apply to the construction of hollow caissons, which are to be sunk to form the foundations. A subsequent notice of the same invention may, we believe, be found in "Weale's Quarterly Papers on Engineering."

In the system adopted at new Westminster-bridge, great importance must be attached to the iron piling and casing to the concrete, of which with timber piles, the lower portion of the piers consists. The first record of the introduction of iron piling is contained in the specification of a "patent granted to Peter Ewart, of Manchester, C.E." (afterwards of Woolwich), in 1822, for a new method of making coffer-dams. Plates or piles, each strengthened by a rib at the back, were driven close together, so as to present a plain flat surface externally; and the butting joints in cross section show hooked edges, dovetailing with the like parts of a narrow pile slid down at the back. A contrivance was introduced at certain distances to allow of expansion and contraction. This invention had, however, been preceded by one in which the piles were formed of a single pattern, with semicircular ends, hooking together, and presenting on the face the appearance of alternate round piles and flat plates. Other inventions succeeded; but in all there were difficulties in driving the thin piles or plates in a direct line and without injury to them, until, by the use of round hollow piles by Mr. Sibley, the requisite area for percussion was provided, and means adopted by boring through the hollow of the pile to ease the course of descent. The round piles were cast with grooves to receive the flat piles. One of the first of the important applications of iron piling which were made was at the Brunswick Wharf, Blackwall, of which a notice will be found in the "Transactions" of the Institution of Civil Engineers.‡

The question of the durability of iron in water is only touched upon in the memoir; but has its importance recognized. In salt water, there is ample evidence that the decomposition is rapid. But, this very action with cements, or any siliceous matter, produces a new substance of exceeding hardness and durability. So that, whilst decay might go on at the exterior of iron casing, the interior, by the access of water and the corrosion, might become only more firmly consolidated.§

We shall proceed in our next to describe fully the mode of construction adopted for Westminster-bridge, and to make such observations upon it as may seem desirable.

THE MANUFACTURE OF BRICKS BY MACHINERY.‖

I now come to the rolling-mill, which is by far the most practical of all, and its general adoption throughout the kingdom would do more to improve the quality of our bricks than any other process. It consists of a pair or pairs of horizontal cylinders running near together, between which the clay is crushed. When bricks are made by hand, or a machine is used which does not pug the clay, I recommend the use of the pug-mill, combined with the rolling-mill. The clay passing first through the rollers, and then through the pug-mill, is ready for use.

All practical men must agree that you cannot

‖ See page 442, *ante*.

have the clay in particles too finely divided, and this very fine division cannot be effected by that universally-used pug-mill. The first process is to crush or grind your material, and then to pug or work it. These mills are—in the case of fire-clays, or any very hard rough substance, such as marls—series of pairs or rollers (generally three pairs) driven by steam. The clay is thrown into the top pair, which are set rather wide apart: the next pair are nearer together, and run at a greater speed; and the third, or bottom pair, are nearly close, and run sufficiently fast to take all the clay as the top pair throw it down. The clay enters these rollers a hard rocky material, and escapes from them entirely ground to a fine dust. For general works, a good single pair of rollers is sufficient. If a marl or hard substance is to be ground, the rollers must be larger in diameter than for unctuous clays, that their larger circumference may bite the marl and draw it in. If the diameter is too small, the lumps would ride between the rollers, and not be crushed without some trouble. For general brickworks a pair of rollers, 3 feet in length, and from 2 feet to 3 feet in diameter, will be found sufficient. The quantity of clay which can be prepared by these mills will be four times as much as can be done by the pug-mill with the same power, and much better, as no portion of it can escape being crushed and minutely divided. These rollers are too often geared to run each at the same surface speed, but I have found that by running the one roller three times as fast as the others (that is, gearing the wheels which connect the rollers at three to one), a double action is obtained, not only crushing the clay, and all hard substances into the finest particles, but also a rubbing action, which more thoroughly divides and amalgamates it, giving also more power to crush up a hard substance than by the pinch of equal rollers. The nature of clays varies so greatly, that no fixed rule can be laid down for their preparation, or whether a combination of rolling mills and pug-mills is necessary, yet this process is most essential if a good article is required. In some works it is necessary to pass the clay through four pairs of rollers and two or three pug-mills, while in another, at no considerable distance, from the difference of the clay, as fine a state of the material may be produced by passing it through a single pair of rollers. I dwell on this subject, as it so materially affects the action of machines and the quality of the ware when made: in fact, this is the groundwork of brickmaking, as it is of all pottery, from china downwards. If we look at pottery, the beautiful stoneware now produced, the large glazed socket pipes used in our town drainage, &c. these are made by machines, but the quality depends more on the preparation of the clay, or the fineness to which it is ground or crushed, than on the machine which moulds it. In most cases a good brick-machine should take the clay after it has been crushed through rollers, and thoroughly amalgamate, or pug and work it, during its manufacture into bricks. Some clays require for a good brick-machine little or no preparation; but these are rare, and they are fortunate who possess them. I have, therefore, only treated of those clays which are most difficult and most expensive to work.

There is a system of preparation called screening; but this only answers for tilemaking, and that on a very small scale. A pair of rollers would do more, at less expense, and better.

If the London brickmakers would use rollers, and crush their clay and ashes altogether, so fine that no hard substance could be felt with the hand, their bricks would be of a very superior quality to what they now are.

There are other systems of preparation; but I have treated of those most universally adopted.

The next process is the manufacture of this clay into bricks; and I cannot refrain here from mentioning what an injurious effect the present system of hand-making has on the habits of men. The brickmakers (that is, the moulders and their attendants), men and lads, are, throughout the kingdom, employed at their trade only during six or seven months in the year, except where bricks are artificially dried in the neighbourhood of collieries. In the winter season, the bricks would be destroyed by frost; neither could they then be dried. They therefore work early and late; and from their having no winter occupation, and on account of their dirty and laborious work, they have such a price per thousand as to compensate them. The result is generally, among this class of men, that, although they are so well off in the summer time, they spend all they earn, leaving the winter to provide for itself. At that season, when they require most to sustain both themselves and their families, as well as fuel, they have nothing to fall back upon, and in too many instances no employment; for, as they earn so good wages in the summer, they do not willingly come down to the price of ordinary labour. These are the men whom the introduction of machinery will affect.

Before entering on the manufacture by machinery, I should state that brickmaking was carried on till within the last few years with comparatively few attempts at improvement. Until the duty was taken off, in 1850, the regulations of the Excise were so strict that any attempts at progress were frustrated; but since the above date most rapid strides have taken place. Machinery has been constructed on all seemingly possible principles to produce this ware in greater quantity, and of superior quality; so that, as far as mechanical make is concerned, it may be called a new manufacture. Although machinery had been worked for many years, it attracted little attention, from its frequent failures in practice. For this reason, new plans have been introduced for the forming of clay into bricks. I shall therefore feel it my duty, in describing these machines, to point out those parts of the several principles adopted which have prevented their being more generally used.

Brick-machines are now very cautiously watched by the makers, which is a matter of no astonishment; for so many machines have been brought out without a due consideration in their construction of what is required by the brickmaker, and many have been introduced by mechanics not at all conversant with brickmaking generally. When they had succeeded in forming a block of earth of the required size, they thought they had attained all that was necessary. I would recommend all, before purchasing, to see a machine in regular every-day work, and to minutely examine the ware which is being sent out for use, the production of the machine.

In a former part of this paper I have mentioned that we wish to manufacture by means of machinery a rectangular block of clay, about 10 inches long, $4\frac{3}{4}$ inches wide, and $3\frac{1}{4}$ inches deep, containing some 154 cube inches, into as compact, hard, and durable a material as a block of stone.

There are four principles on which these machines effect this, one of each I shall briefly describe:—1st, by moulding the dry clay (that is, clay containing only sufficient moisture to allow its particles to adhere, when subjected to considerable pressure) by powerful machinery; 2nd, by imitating the old process of hand-making, filling moulds with soft-tempered clay like mud; 3rd, by forcing clay in a stiff plastic state through dies or apertures the size of a brick, endways or edgeways (a die is a plate with a hole cut in it of the shape which is desired to be given to the clay); and, lastly, forming a stream of clay to the desired shape by rollers.

I will, before explaining these in detail, describe the general principles on which clay is forced into or through these dies and moulds.

The oldest plan of working clay down, and pressing it off through any given aperture, is the pug-mill, which I have before described in the preparation of the clay. This mill is used by both classes of inventors to fill moulds traversing under its delivery, to express the clay through dies, or to fill the material into boxes in which work plungers or pistons to force the clay out through a die as soon as it has received its charge. Next, we have pistons worked by all sorts of mechanical contrivances, of wheel-work and racks, cranks, eccentrics, screws, &c. forcing the clay from boxes or cylinders in which they traverse backwards and forwards, and so by their downward passage force the clay through any given aperture or die. These machines lose much time, as during the up or return passage of the piston all brickmaking is at a stand. Another expressing machine, the patented invention of Mr. Ainslie, is a pair of rollers or horizontal cylinders, driven at a like surface speed, having one side closed, in front of which is the die. The rollers being driven, draw the fed clay through between them, and force it out in one continuous stream of the desired shape.

The next, and, as I have found in my experiments, the most powerful, is a screw fixed on a shaft hung through the centre of a cylinder. The screw in revolving carries the clay down its thread, and not only forces it on with immense power, but so works the clay in its onward passage as to be equal to the pug-mill when used in combination with a rolling-mill. The clay naturally adheres to the stationary surface of the cylinder, and the screw by its revolutions keeps it in a constant state of motion, and rolls and works it, and when it arrives at the end it is forced on through any required orifice. An example of this is before you in the pug-mill part of my machine, but with the addition of knives on the thread of the screw.

To explain the whole of the mechanical contrivances invented for forcing and expressing clay, either through orifices or into moulds, would not aid us in the practical manufacture of bricks, and would, without drawings, occupy too much space.*

The first plan adopted which I propose to discuss is, that of moulding dry clay, or clay as dug from the earth. This has been worked on several principles. The dry clay American machine is about the best example of this class. The clay is merely dug from the earth, and ground through rollers, from which it falls into the hopper of the machine. The bottom of this hopper is a cast plate in which are fourteen brick-moulds. This mould-plate is rather more than double the length of the hopper, and travels backwards and forwards, being driven by wheel-work; so that while one-half of the plate, containing seven moulds, is being filled under the hopper, the other seven are being emptied outside. The moulds have moveable bottom-plates or pistons, which are forced up by an inclined plane as soon as they are free from the hopper, and throw out the bricks contained in them. The moulds are filled as they traverse backwards and forwards by having to pass under a wheel which presses the clay into them. This wheel is hollow, and is filled with steam to heat it, so that the clay may not adhere. I have known an instance on a railway, where the bricks, made of blue lias clay by this machine, were so smooth on the mortar surface, that bridges had to be taken down and rebuilt, because the mortar would not adhere to them. Others force the clay down cylinders into moulds by means of a screw, and some by hydraulic pressure produce a brick ready for the kilns. But these machines are not likely to come into general use, for they have to exert so great a force in order to press the comparatively dry material into the moulds so as to fill all corners (here is the difficulty and the consumption of power), and at the same time so to compress the clay, as to make it sufficiently firm, not only to adhere, but also to withstand the weight of thirty or forty deep, one row on another in the kilns. There must necessarily be an immense amount of power consumed for the purpose of obtaining what is considered a more solid and durable brick. But this is an error which I shall shortly explain. This class of machinery is very expensive. The American, with the engine, costs upwards of 1,400*l*. These machines average the consumption of 20-horse power to drive them. A breakage with this large machinery is very serious, and of too frequent occurrence. I shall be met by the promoters of these machines with the advantage of working up dry clay, saving the whole process of drying the bricks, the labour of carrying to the drying-ground, and again removing to the kilns; also with being able to work all the year uninterruptedly, and independently of seasons. But with how few clays can this be accomplished! The clay is not really dry: it has sufficient moisture to allow it to adhere and give it toughness to support the weight of the stack in the kilns. The great pressure to which

* I recommend a continuous delivery, with a good preparation of the clay; and that on the principle absorbing least power.

it has been subjected in the machine makes it so compact a mass, that it would take a long time thoroughly to dry it. The result would be, in plastic clays, if this principle were generally adopted, that when the firing of the ware was commenced, the outer surface would be dried, but from its close texture the moisture in the centre could not evaporate. The greater heat, as the process of firing proceeds, makes the brick hot, and the moisture in the centre, forming steam, would in most cases blow it to pieces. In many clays the outer surface will shell off, but in others of a more open character, that is, of a more loamy kind, it would be only partially rent, and this would generally cause the bricks to be less solid and compact than those made from tempered plastic clay, which in drying has become sufficiently porous to allow this steam to escape. The firing of the ware made on this principle is as great a drawback as the expensive machinery necessary. The clay, being so powerfully compressed into the moulds, is held on every surface by adhesion. When the pressure is taken from the top, and the piston or bottom of the mould begins to rise, the outer surface of the brick adheres so tightly to the inner surface of the mould, that it takes great power to move it. The centre of the brick, in some clays, rises a little the first, and causes one mortar surface to become slightly concave. The outer edges drag, from the great friction they have to encounter in being freed from contact with 90 inches, or a square surface of more than half as many superficial inches as there are solid inches in the brick itself. These machines are better adapted for marly than plastic clays.

I will now take the working of clay in a soft state, or of the same temper as for hand-making.

The machines for this purpose have all necessarily adopted the principle of moulding, which is much more easily performed than with dry clay, as not more than about four-horse power is required. We have the same duty to perform as with dry clay, viz. to fill each corner of the mould and to expel all the air. A machine of this class was introduced some few years since by Messrs. Ransome, of Ipswich, from America (Hall's machine). This was a pug-mill, which forced the clay into a series of six moulds. A man in attendance, by wheel-work, gave the clay a pressure into the moulds with one leverage, and with another drew out from under the machine the six full moulds, the same action replacing them with six empty ones. Although largely used in America, it did not become general here. The difficulty in this class of machinery is, that while the moulds are being drawn from under the pressure of the clay, directly one part of the mould is clear, the pressure, which is on that part of the brick still under the machine, lifts or forces the clay upon that side or end which is free from pressure; and when delivered, the bricks are of unequal thickness.

One machine, the London Company's Brick Machine, corrects this by striking or cutting off this superfluous clay after it has left the mill or pressure.

Machines working soft clay have several disadvantages for the brick-field: the material being in such an almost fluid state, the bricks are very subject to be injured in form in being carried off. Nor are these machines sufficiently portable to be easily moved each day as the drying ground is filled round them. The clay being worked in so soft a state, the great evaporation in drying leaves the bricks very porous, if it is a loamy clay, or causes them to undergo an excessive contraction if a strong one. Neither are they sufficiently stiff to be delivered from the mould by the machine, but would have to be taken off by hand and emptied, which is a very slow process, and incurs considerable manual labour, as the machine requires not only to have the mould taken from it and emptied, but also to be fed with the clay again. In brick-making by machinery, we should employ as little labour as possible, but should give the machine the raw material and take away the manufactured article without any intermediate labour. It is, in my opinion, a serious objection to have to feed a machine with moulds, as is generally done in this class of machinery. In making 15,000 bricks a day, and calculating the moulds to weigh 4 lbs. each, which is a low average, as they are generally made of metal, we have to employ the extra manual labour of taking off, and again feeding on the machine (two removals) rather more than 53½ tons of iron, or of whatever materials the moulds may be composed; while the whole weight of clay for the day's work is not more than seventy-five tons. Unless the machines can be easily moved from day to day as the drying-ground is filled, great additional labour will be incurred; for the softness of the clay will not allow the bricks to be roughly wheeled, and they must be transported very carefully.*

I now come to brickmaking by machinery with clay in a plastic state, but of such a stiffness that the bricks, when made, are too firm to lose their form in carriage or removal from the machine to the drying ground, or in that state of temper in which it will make, in most clays, the best and soundest article, if properly mixed and prepared, having only sufficient moisture to allow of its being thoroughly amalgamated. This clay will make bricks which, when well burned, will have a very metallic sound on being struck; and this is the best proof of their solidity and close texture.† Bricks are made with clay in this state by moulding; by pressing through dies; by forcing through dies with tongues or cores (making hollow or perforated bricks); and, lastly, on the principle of my own machine, by taking the stream of clay from any expressing machinery, and forming it into a block by rotating surfaces. Moulding is subject to the same difficulties which I have described in soft clay,—the lifting in the end or side of the mould first relieved from pressure, though not to the same extent. But it takes considerably more power to drive the machines, and to fill the clay into the bottom corners of the moulds. In these machines the bricks are delivered from the moulds by pistons, as in dry clay, but are more subject to swell on the upper mortar surface, and to drag on the sides of the moulds.

There are many principles on which the moulding of the clay is worked; but the limits of this paper will not allow of my explaining them. The system of forcing the clay through dies the size of a brick, edgeways, and then dividing the stream of clay into bricks by a frame of wire 3 inches, or the desired thickness of the brick apart, has been tried by several; but here arises another difficulty—viz. to get a good smooth square corner or edge to the stream of clay as it escapes from the die. The large aperture through which it is forced, 50 square inches, does not offer a sufficient resistance to force the clay into the angles of the die. Clay, when expressed through an aperture such as this, travels fastest in the centre, having less friction or resistance through its own substance than over the smoothest metal, wood, or any fixed matter. Clays travel, when forced, in the same manner as water running through the same space. The centre of the stream, having the least friction, travels fastest; while the outside, from the friction of the stationary surface which it has to travel over, does not flow so fast. So it is with clay; that which escapes through the centre, meeting with no resistance, travels as fast as the power forces it forward; but the outward surfaces are constantly dragging against the stationary metal or wood of the die, and more particularly so at the corners, the clay escaping with jagged or saw-like edges. The corners of the square die have the smallest body of clay to contend with the largest amount of friction. To remedy this, Mr. Heritage brought out his patent water die, which is a double die, or escaping aperture, with the intervening space filled with water. The clay, after leaving the actual die with a rough edge, passes through the water, and then through the second smaller die, which greatly improves it. Another machine, Mr. Clayton's, was introduced to obviate the difficulty of a rough edge, by having the two ends of the die to rotate. This was an improvement in the right direction. When the clay is delivered from machines on this principle, it has yet to be divided into bricks. The stream of clay is, in most instances, in constant motion, and in order to make 15,000 bricks per day, must travel 7 feet per minute. The machines hitherto introduced cut off these bricks while in motion at right angles to the die, but having no compensating motion for the onward movement, they depend entirely on the speed with which the man can pass the frame of wires through the stream of clay. It is therefore impossible for them to make a square cut, and if at all nearly correct, they must work so slowly that the advantage of the machine is lost. A brick machine, to be perfect, should effect this, and not depend on manual labour. If the clay is travelling at the rate of 5,000 bricks per day, a man cannot cut them off square, while in motion, with a cutting apparatus working at right angles to the die. If there is a compensating motion on the wire frame, we have still equal difficulties to contend with: either the stream of clay escaping from the die does not travel at one uniform speed from irregular feeding, or the man in attendance draws his wires too slowly or too quickly to cut correctly. We have an example of this cutting in the Ainslie Company's tile-machine, and a brick machine was exhibited at the Royal Agricultural Society's meeting at Carlisle last year on this principle, by Messrs. Porter, Hind, and Porter. The machine itself must do this with mechanical truth.

The most universally used die machine which has been extensively worked up to the present time is Mr. Beart's patent for perforated bricks. This gentleman, who is practically acquainted with these matters, in order to remedy the difficulties I have mentioned in expressing a mass of clay through a large aperture or die, hung a series of small tongues or cores so as to form hollow or perforated bricks. By this means the clay was forced in its passage through the die into the corners, having the greater amount of friction now in the centre. Still, the bricks came out rough at the edge with many clays, or with what is termed a jagged edge. The water die was afterwards applied to this machine, and the perforated bricks, now so commonly used in London, are the result. In Mr. Beart's machine, which is a pug mill, the clay is taken after passing through the rolling-mill, and being fed in at the top, is worked down by the knives. At the bottom are two horizontal clay-boxes, in which a plunger works backwards and forwards. As soon as it has reached the extremity of its stroke, or forced the clay of one box through the die, the other box receiving during this time its charge of clay from the pug-mill, the plunger returns and empties this box of clay through a die on the opposite side of the machine. The result is, that while a stream of clay is being forced out on one side of the machine, the clay on the opposite side is stationary, and can, therefore, be divided into a series of five or six bricks, with the greatest correctness by hand. Some of these machines have both boxes on one side and the plungers worked by cranks. This machine cannot make bricks unless the clay has previously passed through rollers, if coarse, for anything at all rough, as stone or other hard substance, would hang in the tongues of the die. But the clay being afterwards pugged in the machine, is so thoroughly tempered and mixed, that the bricks when made cannot be otherwise than good, provided they are sufficiently fired. As to the utility of hollow or perforated bricks, that is a matter more for the consideration of the architect or builder than for the brickmaker. Perforated bricks are a fifth less in weight than solid ones, which is a matter of some importance in transit; but it takes considerably more power to force the clay through those dies than for solid brick-making. In the manufacture of perforated bricks there is also a royalty or patent right to be paid to Mr. Beart.

Having thus explained the principles on which mechanics have attempted the manufacture of bricks, and not considering any of them quite perfect, I turned my attention to what was the cause of failure in these several principles.

In the moulding of clays in a dry state by machinery, we have to employ great power and large expensive machines to force the clay into the corners of the moulds, and to sufficiently press it, so as to make it adhere. When we do

* Since writing the above, I find the Patent Brick Machine Company have improved their machines; and, according to a circular received from the secretary, Mr. Mount, they now work the clay in a much drier state than it can be moulded by hand. It should not, therefore, come under that class of machines in which I have placed it. It is also portable.—H. C.

† There are exceptions, but this is generally the case.

succeed in making from the clay a nice true block, in appearance all we could wish, it has then to go through the ordeal of firing, from which with but few clays it would come out sound. Nor must we forget the serious and too frequent losses by breakage of these machines.

Next in moulding clays in a medium or stiff plastic state, and also in a soft plastic state, when the mould escapes from the pressure of the clay, that part which first leaves the machine is apt to be forced up above the mould, causing that end or side to be thicker, and in those which lift the brick out of the mould by pistons, from the clay dragging, that is, adhering so tenaciously to the inner surface of the moulds, an effect is produced of making one mortar surface concave. There is also a great wear on the moulds, from the pistons which lift the brick travelling in the grit of the clay: this soon cuts them larger, and the pistons must require frequent renewal.

Those machines which force the clay through dies to make solid bricks should deliver it the length and depth of a brick edgeways, so as to cut every 3¼ inches, that the rough surface left by the wire may be the flat of the brick which forms the mortar joint. We have traced the difficulties of the dies, and also the imperfections of the cutting arrangements generally used. I came to the conclusion that for a brick machine to become generally useful it should embrace the following advantages, and these I have attempted to realise. First, it should be portable, in order to save labour in carrying off. It should amalgamate or pug the clay, and then form it into a stream of material the size of a brick edgeways, and divide it into bricks by the action of the machine itself. It should have no cessation, but be intermittent in its action: it should work at great speed, that is, deliver off its bricks as fast as it is possible to remove them. To produce 15,000 per day we have to to pass seventy-five tons of clay through the machine, and to make solid and hollow, or perforated bricks, with equal facility; in fact, I do not consider any machine perfect which requires assistance in cutting off or otherwise. As I before remarked, a machine should be fed with the raw material, and deliver out, without any assistance, the manufactured article, with the consumption of as little power as possible.

I shall now explain the action of my own machine, an example of which is before you.

The clay is fed into a pug-mill, placed horizontally, which works and amalgamates it, and then forces it off through a mouth-piece or die of about 65 square inches, or about half an inch deeper and half an inch longer than is required for the brick, of a form similar to a brick on edge, but with corners well rounded off, each corner forming a quarter of a 3-inch circle, for clay will pass smoothly through an aperture thus formed, but not through a keen angle. After the clay has escaped from the mill it is seized by four rollers, covered with a porous fabric (moleskin) driven at a like surface speed from connection with the pug-mill.* These rollers are two horizontal and two vertical ones, having a space of 45 inches between them: they take this larger stream of rough clay and press or roll it into a squared block of the exact size and shape of a brick edgeways, with beautiful sharp edges, for the clay has no friction, being drawn through by the rollers instead of forcing itself through, and is delivered in one unbroken stream. The rollers in this machine perform the functions of the die in one class of machinery, and of the mould in the other. They are, in fact, a die with rotating surfaces.† By hanging a series of mandrills or cores between these rollers, or by merely changing the mouthpiece, we make hollow and perforated bricks without any alteration in the machine. The pulley which drives the belt working these rollers is not of sufficient diameter to be able to draw the clay away from the mouthpiece, if the man feeding the machine should neglect his work. This small pulley runs loose in its strap, leaving all the details of the machine stationary until more clay is fed into the mill, when it again immediately resume its functions. The bottom roller carries an endless belt, on which the stream of clay is delivered to the cutting-frame. This carries a wire, which is constantly traversing at a compensating angle, while the clay is in motion, and thereby makes a square cut. After it has divided one brick, it changes its action and cuts off the succeeding one at the opposite angle to that which it had previously traversed. This wire is put in motion from gearing in connection with the rollers, which press the block of clay into the shape of a brick, and thereby acts with mechanical correctness. For if the smallest portion of clay escapes from the mill, motion must be given to the rollers, or rotating die by the driving strap, and from them to the cutting wire. The bricks, as fast as made, are passed on by the machine to boys in attendance, who receive them on pallet boards, and remove them to the drying floors or hacks. It will be seen that I form my brick or squared block of clay with less power and friction than by moulds or dies, that no resistance is offered to the clay, but that, on the contrary, it is impelled forward by the driven rollers; that from the machine itself cutting off the bricks at an angle, compensating for the onward movement off the clay, not only a true cut is made, but also the intermediate labour required by most other machines is saved. This machine, with four-horse power, will throw of bricks, if fed with clay, faster than it is possible to remove them. Another advantage in the pug-mill is that the clay is thoroughly amalgamated. Bricks can be made by this machine for one-half the cost of hand-making. If it was employed for thirteen weeks, making only 15,000 a day, the saving of labour would purchase the machine; and each machine occupied throught the year would effect a saving of 600*l.* per annum. Besides this, the superiority of the bricks made by it commands a higher price in the market. Four hundred of these machines occupied throughout the year would make all the bricks required for the use of this country, and effect a saving of 240,000*l.* a year in labour.

* The feeding these rollers with a stream of clay by means of the die falls within the claims of a patent taken out by Mr. Clayton. I have, therefore, made arrangements with that gentleman for the use of that part.

† The original inventor of using rollers to compress the clay into any desired shape was the Marquis of Tweedale.

PROPOSED GOVERNMENT OFFICES.

The Government have determined to build, with as little delay as possible, two new public offices, one for the Foreign Secretary, and the other for the War Secretary. These buildings are to be erected on a site between Charles-street and Downing-street. Plans are to be sought, too, for laying out the remainder of the ground lying between Whitehall on the north, Great George-street and New Palace-yard on the south, the Thames on the east, and St. James's-park on the west.

It is intended to invite architects of all countries to offer designs for these undertakings, and we understand that particulars and instructions to competitors are in course of preparation.

THE VICTORIA MILITARY HOSPITAL, AT NETLEY, ON THE SOUTHAMPTON WATER.

On the 19th of May last, her Majesty the Queen, as we mentioned at the time, laid the first stone of the new military hospital, at Hamble Cliff, a little more than a mile from the ruins of Netley Abbey, and wrote her name upon the plans in the fine bold hand we all know.* It is intended for 1,000 men (may it never be full), who are distributed between two blocks of buildings, each complete in itself, as will be seen in the plan and view appended: one of the blocks will be more especially devoted to medical, the other to surgical cases. The view shows the whole extent of the hospital: the plan for the sake of size is confined to one block of buildings (the other being exactly similar), and the central building appropriated to the management and to sick officers. To be precise,—

The ground floor of one wing, contains—

1	ward, to accommodate	.....	16	patients.
8	do.	,, ...	9	,, each.
1	do.	,, ...	7	,,
4	do.	,, ...	4	,, ,,
1	do.	,, ...	6	,,
5	do.	,, ...	2	,, ,,

Waiting-room, wardmaster's and assistant ward-master's quarters, principal medical officer's and clerk's offices, medical officers on duty, library and reading room, librarian and chaplain's retiring-room.

The buildings in the rear,—Engine-room, boiler-room and coal store; kitchen, scullery, pantry, larder, room for arranging dinners, with lift to dining-rooms above; steward's quarters, bedding and provision stores, medical officers' room, medical registry and appliances room, dispensary, drug-room, and surgery man's room; cellars in the basement for steward's stores.

The outbuildings,—Orderlies' rooms, itch wards, contagion wards, pack stores, cook's and engine-man's quarters; coal stores and store-rooms; *post mortem* room and dead house; wash-house and ablution-rooms: sluice conveniences, and ash-pits. Since our view was made it has been determined to build these two stories in height.

The first-floor wing contains—

2	wards, to accommodate	.....	16	patients each.
10	do.	,, ...	9	,,
2	do.	,, ...	8	,,
2	do.	,, ...	7	,,
2	do.	,, ...	6	,,
6	do.	,, ...	2	,,

Medical registry and assistant ward-master's rooms, dining-room, cook's room, and scullery.

The second floor—

1	ward, to accommodate	.....	16	patients
10	do.	,, ...	9	,, each.
2	do.	,, ...	8	,, ,,
2	do.	,, ...	7	,, ,,
2	do.	,, ...	6	,, ,,
2	do.	,, ...	3	,, ,,
6	do.	,, ...	2	,, ,,

Operating theatre, medical registry, and assistant ward-master's room.

In the centre block on the ground floor are,—Wardmaster's quarters, waiting-room for 200 men, orderly and medical officer's room, offices for principal medical officer and clerks, apothecary's office, purveyor's office and purveyor's clerks', Chelsea Board-room and ante-room, baths of every description, bath man's room, fatigue man's room; chapel, to accommodate 800, with vestry and book-rooms.

On the first floor and second floor respectively,—Six rooms, each to accommodate one sick officer; one day-room for officers, mess kitchen, servants' rooms, &c.; three rooms, each to accommodate two sick officers' servants; surgeon's and assistant surgeon's quarters; kitchens, servant's rooms, larders, &c. attached; large store-rooms for apothecary or purveyor's stores; bath-room for officers.

The corridor is to be 12 feet wide throughout: the windows to open for the circulation of air. All the wards, it will be seen, have attached to them water-closets, bath, and scullery, and also an ablution space, differing in size according to the number of patients in the wards, which vary from two, the smallest, to sixteen, the largest.

A nurse's or orderly's room is to open off each ward, with a doorway only leading into them;—"no *door*, because, if capable of being closed, irregularities are more likely to take place; and as there is no fireplace, the orderly will be interested in looking to the fire and comfort of the ward for himself, as well as for the patients."

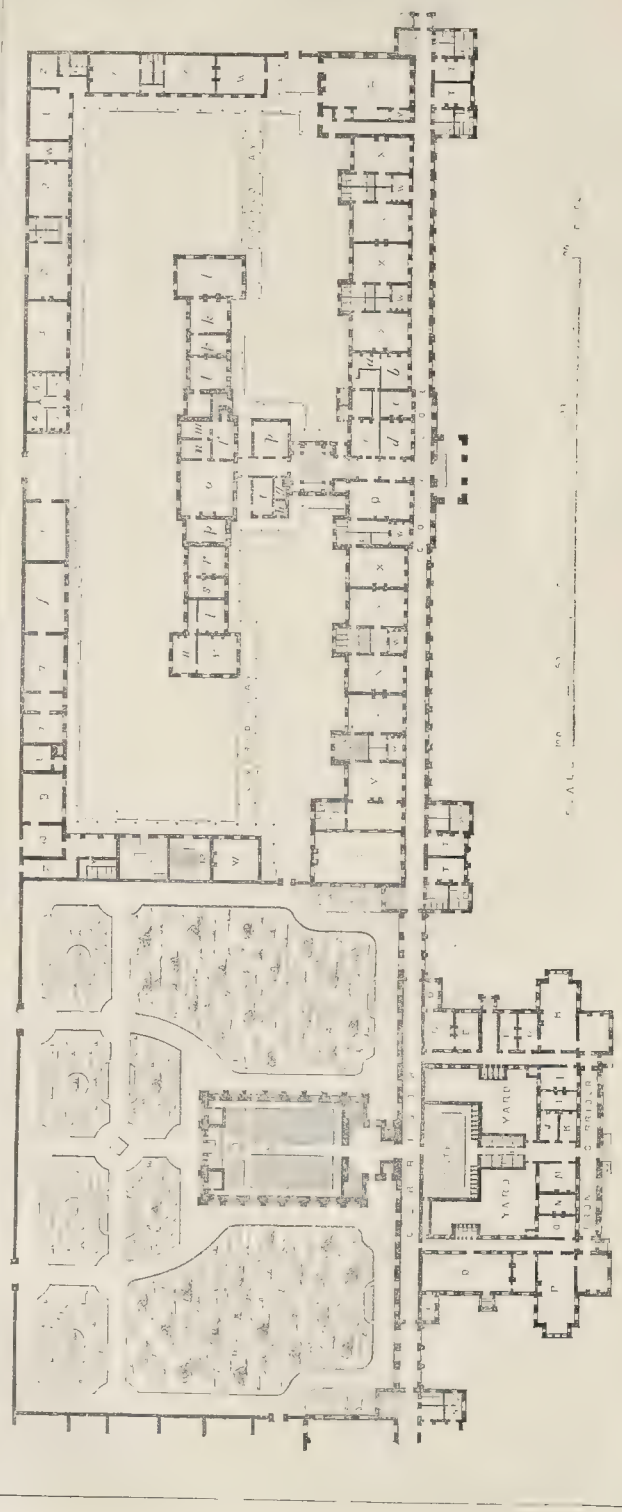
The wards for four men, according to the official statement, give 1,315 cubical feet to each patient; the wards for two men, 1,406 feet; and the wards for seven men, 1,800 feet: this largest quantity, by the way, is less than some authorities consider necessary. Arrangements are made for the supply of fresh air irrespective of the windows: and there are flues and exhausting shafts for the removal of that which is vitiated.

The beds are to be arranged between the windows as much as possible; with 4 feet between them laterally, and between the ends, in the small wards, 10 feet,—in the larger, 18 feet; allowing each bed 7 feet in length.

The contract for the foundations up to the plinth is being carried out by Mr. E. Smith, of Woolwich. The remainder of the building is not yet contracted for. The exterior of the

* The stone bears the following inscription:—"This stone was laid on the 19th of May, in the year of our Lord, 1856, by her Most Gracious Majesty Victoria, Queen of Great Britain and Ireland, to be the foundation-stone of the Victoria Military Hospital intended for the reception of the sick and invalided soldiers of her army."

hospital is to be of red brick, with dressings of Portland cement.



The building was designed by Mr. Mennie, the surveyor of the Royal Engineer's department in Pall-mall, under the direction of Colonel O'Brien, the assistant quartermaster-general; Dr. Mapleton, of the 15th Hussars; and the deputy-inspector-general of fortifications, to whom, as a committee, the subject was referred by Lord Panmure.

In an ensuing number we shall speak of the arrangement of hospitals in general, with especial regard to the plans of some abroad.

The following will serve to show the appropriation of the several apartments in the Victoria Hospital, marked on the plan.

THE VICTORIA MILITARY HOSPITAL: PLAN OF GROUND-FLOOR.

COMPETITIONS.

Highbury Chapel.—Seven designs were submitted for a Wesleyan chapel, to be erected on the Park-hill Estate. Two designs were selected, the authors being Mr. Pocock, of Chelsea, and Mr. C. Laws, of Doughty-street: ultimately the committee decided in favour of the latter. The building is in the Gothic style,—the basement being formed for Sunday-schools. The estimated cost is 3,600*l*. It is also proposed to erect day-schools in connection, after the completion of the chapel, at an additional cost.

Norwich Workhouse.—We understand that about thirty designs have been sent in for the proposed new workhouse, on the Dereham-road, and have been exhibited during the past week. The local paper speaks well of some of them.

THE VICTORIA MILITARY HOSPITAL, NEAR SOUTHAMPTON.—Mr. Messil, Architect.

SIR CHARLES BARRY AND THE GOVERNMENT.

The architect of the new Houses of Parliament, as we said would be the case, has been forced to yield to the decision of the Treasury. A copy of the protesting resolution passed by the council of the Royal Institute of British Architects having been forwarded to Mr. Wilson, elicited the following reply:—

"Treasury Chambers, 15th July, 1856.

Gentlemen,—The Lords Commissioners of her Majesty's Treasury have had before them the resolution passed at your meeting on the 5th instant, on the subject of Sir Charles Barry's professional remuneration as the architect of the New Palace at Westminster, which were [*sic*], enclosed in your secretaries' letter of the 9th instant.

Although my Lords cannot recognise your right to call upon Parliament or her Majesty's Government to conform to the regulations or opinions of the society, in arrangements which may be made with professional gentlemen undertaking public works, their Lordships are anxious that no misunderstanding should exist in the minds of the respectable body which you represent on the subject of the remuneration of Sir Charles Barry as architect of the New Houses of Parliament.

Their Lordships have therefore directed me to transmit to you herewith the enclosed copy of their minute of the 4th instant, in order that you may be informed of the views by which this Board has been governed in the matter.

You will learn from that minute that this Board has not in its recent correspondence with Sir Charles Barry proposed any new principle with regard to the professional remuneration of architects employed on public works, but have [*sic*], on the contrary, endeavoured to carry out in a liberal spirit an arrangement made in 1838, in consequence of opinions expressed in Parliament, and acquiesced in by Sir Charles Barry in the following year, as shown by the correspondence quoted in the enclosed minute which took place in 1838 and 1839, and you will observe that the only objection then raised by Sir Charles Barry regarded the amount of remuneration proposed, and not the principle on which it was based. Their Lordships feel that you might, with greater propriety, call upon a member of your own body for an explanation of the motives by which he was governed, rather than address a remonstrance to her Majesty's Government against the deviation, acquiesced in by him in 1839, from the rate of charge recognised by the profession.—I am, &c.

(Signed) James Wilson."

There will be but one opinion, we conceive, as to the *generous* tone of the last part of this reply amongst those who remember the manner in which Sir Charles Barry was coerced into an arrangement at a moment when refusal on his part was impossible, and that his request "to be favoured with the particulars of the principle upon which the proposed sum," as a remuneration, was recommended (in order that he might object to it), was peremptorily refused!

The terms insisted on by the Treasury, it will be recollected, are a commission of 3 per cent. on the amount expended (to apply also to future works), 1 per cent. on the same amount for measurement, and such a sum as remuneration for services rendered in the warming, lighting, and ventilating arrangements as might be determined. This point, together with the question as to the works upon which the architect should hereafter be allowed the commission of 1 per cent. for measuring, was referred to the Chief Commissioner of Works, who thus reported:—

"As to the first point, I am of opinion that Sir C. Barry is entitled to receive, as a remuneration for his services under that head, a payment of 4,925*l.*; and I arrive at this amount by allowing him 300*l.* per annum, from January, 1840, to April, 1847, in respect of the preparation of plans and estimates for the various schemes suggested by Dr. Reid, which were either abandoned or greatly modified previously to carrying into effect the existing arrangements, and 500*l.* per annum from April, 1847, to November, 1852, for a continuance of the same duties, and also for taking charge of the warming, ventilating, and lighting apparatus throughout the entire building, with the exception of the House of Commons.

Upon the second point, I am of opinion that an allowance for measurement of 1 per cent. should, for the future, be made only upon such accounts as require the services of a surveyor for their preparation, unless the architect should be authorised in writing by the First Commissioner of this Board, and with the approval of your Lordships' Board, to make any special charge for special services so authorised."

The following is the letter, addressed to Sir C. E. Trevelyan, with which the architect has closed the dispute:—

"Old Palace Yard, 15th July, 1856.

Sir,—I have to acknowledge the receipt of your letter of the 10th inst. transmitting to me, with reference to my letter to Mr. Wilson of the 23rd ult. copy of a farther minute of the Lords Commissioners of Her Majesty's Treasury, dated the 4th inst. relative to my remuneration as the architect of the New Palace at Westminster.

It is with the deepest regret and disappointment that I find their Lordships have put aside my proposal, to refer all matters in dispute between us to arbitration. Their Lordships must be perfectly aware that no individual in my position could with the least chance of success contend with the Government, and therefore that the power of decision virtually rests with themselves: but this very circumstance, I had hoped, would ensure their determination to refer the case to some authority the impartiality of whose decision could not be impugned.

However, as their Lordships have thought fit to determine otherwise, and as it is evident, from the tenor of their minute of the 4th inst. that no further arguments in support of my claim could alter their determination, I have no course left but to yield to necessity, and accept the terms dictated to me; in effect, to submit to a sacrifice of what I fully believe to be fair and legitimate claims, amounting, exclusive of a large sum for interest on payments delayed, to 20,000*l.* at the least.

But while thus compelled to yield to the decision of their Lordships, I feel it due to myself and to my profession to state that I do not admit the fairness of the arguments, or the accuracy of the statements, upon which it is manifest this decision has been founded; and further, that after a reconsideration of the whole case, and especially of all the reasons which have been urged on the part of the Government, I remain firmly convinced that the arrangement forced upon me in 1839 has been entirely set aside by the non-fulfilment of any one of its conditions, and my claim ought in justice, to say nothing of liberality, to have been allowed in full.

With respect to the completion of the works in hand, I beg to add, that as every other architect employed on public buildings has been and is still being paid his full commission, nothing would induce me to continue my services upon the reduced rate of commission proposed, but the strong and natural desire I have to complete a work, which, by the devotion of so many years of labour and anxiety, I have endeavoured to render not unworthy of the country.

I am, &c.

(Signed) Charles Barry."

We repeat the expression of our conviction that Sir Charles Barry has been very ill treated by the governing powers, and that the profession at large has been injured by the same blow.

FOREIGN ART-NEWS, &c.

The new Danube Sluice, Battina.—When about fifty years ago the Francis canal was built, a desideratum remained to have it prolonged to the Danube, as otherwise it could not be used permanently. By the building of the new sluice, now completed, this desideratum has been obtained, and even the largest Danube steamers can navigate the whole extent. The work is a huge one, and can be only compared with the bridge over the Lagunes of Venice. The walls, extending to the length of 100 fathoms, present a uniform mass, as nothing but *Béton* (*mortier hydraulique*) has been used, consisting of a chemical composition of silicious acid with lime and clay, which becomes hardened in the contact with water. M. Mihalik, Austrian engineer, is the builder of the Danube sluice.

The Tuileries and the Tuileries Gardens.—Even this admirable creation of Le Nôtre is to be remodelled. The whole *circus* of that historical park is to be heightened, the two fine terraces on the Seine and the Rue de Rivoli are to be demolished, and the garden transected by a large avenue leading from the Place Vendome to the banks of the river. This avenue will receive an iron bridge (for foot passengers), which will lead to the Quai d'Orsay and the Faubourg St. Germain. The garden will receive an addition of marble and bronze statues, busts, vases, &c.; to be illuminated by 10,000 gas-lamps, like the Champs Elysées, and be open until eleven p.m. The latter improvements are desirable, still the work of Le Nôtre deserves some consideration. It is also asserted, that the rebuilding of several parts of the palace of the Tuileries, as the Pavillon de Flore, the great gallery on the Seine, up to the Carrousel gateway, has been sanctioned.

Chinese Works on the Manufacture of Porcelain.—When the late M. Ebelmen was director of the manufactory of Sèvres, he engaged M. Stanislas Julien to publish in French the Chinese works on the making of porcelain, existing at Paris. M. Julien has consulted three works of the French Imperial Library. 1. A Mémoire used by P. d'Entrecolles, published in 1325 (?), and which up to 1823 had passed through twenty-one editions. 2. A Dissertation of Tchou-thou tch'ouen, from about the middle of the last century. 3. A History of the Porcelain of King-ching, where the Imperial manufactory is situated. This work contains the following chapters:—Examination of old porcelain, porcelains of King-te-chin; explication of procedures; description of ovens, workmen, artists, enamel, colours, varnish, &c. From the type of characters found on some old china, it is evident that it had been made in that country some time before the Christian era.

Probable Stoppage to the Export of Pictures in Upper Italy.—The Austrian Government have ordered the purchase of the remainder of the picture gallery, *Manfrin*. The exportation of such treasures as the sketch-book of Giovanni Bellini, the mechanical drawings of Leonardo da Vinci, &c. has led to the determination to save the remnants of that famous gallery from a similar fate.

France: Provision for those employed on public Works.—The sums derived from the sale of the Orleans property are to be spent in a most beneficial manner. There will be established in the forest of Vesinet, near St. Germain, a hospital of 300 beds, where every person who has been employed on public works will be received in case of accident, illness, &c. The sum to be expended on this establishment is 1,300,000 francs. Masters also will be allowed to send their workmen to the hospital, if they pay a certain insurance rate for each of their men. Another workmen's hospital is to be erected at Vincennes, for convalescents, to contain also 300 beds, four patients only to be placed in one room.

CHURCH-BUILDING NEWS.

Stamford.—St. John's Church will be re-opened on the 23rd of September. The works are progressing. The stained glass for the east window, which is in the hands of Mr. Oliphant, of London, is completed: that for the west window is nearly completed; and both windows will be inserted before the re-opening.

Risholme.—The roof has been placed on the new parsonage-house at Risholme, near Lincoln, which is being erected by the Rev. W. F. J. Kaye, the rector. The building is in the Mediæval style, of white brick, with red brick weatherings, and the arches of red and white brick alternately, with strong courses of red, white, and blue. It is erected in a shady position, and presents an air of great quietude. The works are executed by Mr. Charles Ward, builder. On Saturday night before last the rev. gentleman treated the whole of the workmen engaged on the works (about thirty in number) with a bountiful supper.

Braintree.—On Monday, in last week, the ceremony of consecrating that portion of the new cemetery, at Braintree, specially set apart for the interment of those connected with the Established Church, took place, the Bishop of Rochester officiating. The ground selected for the cemetery is about half a mile from the centre of the town, on the London road. It stands upon the side of a hill, and comprises 5 acres 1 rood, of which about 3¾ acres are devoted to the purposes of interment. The line of separation is simple and unoffensive. There is only a gravel walk, about 18 feet wide, with unobtrusive iron fencing about 3 feet 6 inches high on either side. At the entrance is the keeper's lodge, and next the road an iron fencing, with brick piers, stone-capped. About the centre stands the chapel, built in the Gothic style, with red brick facings, and Caen stone dressings, whilst from the porch in front rises a stone turret and spire, 60 feet high. The two chapels are combined in one building. The main entrance to each chapel is at the side, the Episcopal one also having an entrance at the front; and each chapel is provided with a vestry. The whole building is under one roof, with a divi-

sional wall in the centre. The total cost is about 3,000*l.* and includes—chapel and lodge, 1,300*l.*; ground and fencing, 850*l.* The architect, from whose designs the buildings were erected, is Mr. Johnson, of Bury St. Edmund's; the builder, Mr. J. Brown, Bocking; clerk of the works, Mr. T. Howell; and Mr. Davidson, landscape gardener, of London, laid out the grounds.

Deddington.—On Tuesday before last the corner-stone of the church of St. John the Evangelist, about to be built at Milton, in the parish of Adderbury, was laid by the Rev. E. Payne, rural dean. Mr. Butterfield is the architect.

Windsor.—The new cemetery ground (in quantity five acres) has been staked out, and the necessary buildings will be immediately commenced. The site is considered desirable, and the difficulty of the drainage has been remedied.

Greenhithe and Gravesend.—The Bishop of Rochester will consecrate the church which has just been erected at Greenhithe, on the 26th instant. The edifice is dedicated to St. Mary the Virgin. Last week his lordship consecrated Christ Church, Gravesend, just erected.

Cradley. — The consecration of the new Church of St. John the Evangelist, Storridge, Cradley, took place last week. The new edifice lies close by the turnpike-road from Worcester to Hereford, near the eighth mile-stone. There is also a new parsonage, the latter a quaint arrangement of various coloured bricks and stucco. The church is constructed of the light-coloured stone from Cradley quarries, and is in the decorated style of fourteenth century. It comprises a nave 55 feet long and 22 feet wide; a chancel 26 feet by 16 feet, and a tower at the west end, surmounted by a broach spire, which rises to the height of 105 feet from the ground. The porch is on the south side of the nave. The walls are built in hammer-dressed range work, with rubbed quoins and dressings. The roof is covered with Broseley tiles. The spire is provided with a lightning conductor. The roofs of the nave, chancel, and porch are open to the ridge: that of the nave rises 38 feet from the ground. The chancel has two single-light windows on either side. In the nave there are one single and two double-light windows on the north, and the same on the south side. All the windows except the east are filled with thick plain glass. The east window is of three lights, the centre one being considerably broader than the two on the other side; but the space thus gained has given the architect greater scope in the treatment of the stained glass which fills the window. The chancel has ornamental oak benches placed as stalls, and the nave is furnished with open benches of stained deal. The wall space around the chancel arch is decorated with inscriptions in colour. The stonework, where it is spayed at the windows, is pointed with red mortar. The wall behind the altar has a deep crimson reredos, and the altar rail is supported by foliated ironwork, painted in the richest colours. The east window is also full of colour. The subjects treated in the stained glass are as follow:—The east window, the glass of which was designed and painted by the architect, represents the Crucifixion, symbolically treated; the most prominent object in the centre light being the figure of our Lord upon "a Cross of Glory," which also represents "the Tree of Life," as described in the Apocalyptic Vision, from the stem of which issue branches "bearing twelve manner of fruits." Our Lord is crowned with thorns: around his loins is thrown the purple garment of Bozra: his feet crush the head of the Serpent, which is entwined round the lower stem of the Cross. St. John the Evangelist is seated at the foot of the Cross. On either side of the Evangelist are two of the early converts to Christianity, namely, St. Mary Magdalene, St. Paul, Cornelius, and the Ethiopian Eunuch, bearing texts charged with appropriate inscriptions, in exemplification of the text at the foot of the central light, "And I, if I be lifted up from the earth, will draw all men unto me." Over the title I. N. R. I. in the head of the light surmounting the Cross, is suspended the Crown of Glory. The side lights contain, right and left of the Cross, beneath low canopied niches, the Virgin and St. John the Evangelist. The upper parts of the side lights contain angels in adoration, with instruments of music. The Glory of the Sacrifice of the Cross is farther symbolised in the tracery of the window, by the Adoration of the Lamb, represented as standing on the altar of burnt sacrifice, placed on the Holy Mount, from the sides of which proceed four rivers, symbolising the four Evangelists. The remainder of the tracery contains angels with "golden vials full of odours, which are the prayers of saints." The architect, who designed and superintended the erection of the church and parsonage, is Mr. Frederick Preedy, of Worcester. He also designed and executed the figures in the coloured glass of the east window. Mr. George M'Cann, of Malvern, is the contractor. The founders and endowers of the church are three ladies, sisters of the Very Rev. C. S. Luxmoore, deceased, late rector of Cradley and Dean of St. Asaph. The site of both buildings, as well as land for the churchyard and glebe, have also been provided by these ladies, and the parsonage erected at their expense.

Pembroke.—The churches at Warren and Bosherston, in the county of Pembroke, have been lately restored (Mr. D. Brandon, architect) and reseated, all the seats being free for the use of the poor of both parishes. The chancel of the former was rebuilt at the cost of the bishop of the diocese, but the funds for the rest of the work, and also for the restoration of Bosherston Church, were provided by the Earl of Cawdor, who has likewise liberally supplied the means for restoring several other churches in the neighbourhood.

Capenhurst.—The first stone of Capenhurst Church was laid on Wednesday in week before last, by the Rev. R. Richardson, of Capenhurst Hall. The building is to be erected at his own expense, for the accommodation of his tenantry and those of the adjoining township of Ledsham. He is also to endow the church. The church is to be in the Decorated style of architecture, designed by Mr. Harrison, of Cheshire, architect, and is to accommodate 200 persons.

Hulme.—The new church of St. Mary, Moss Side, Hulme, appears to be not far from being completed. The spire is finished: it is about 240 feet high from the floor of the church, the tower being 24 feet square. The tower contains a belfry, with large double windows on each side and pinnacles at the corners. The spire contains four heights of windows, each of two lights, with canopied tops, and crosses at the apex. The vane is of iron and copper, 18 feet high. The builders, Messrs. Ellis and Hinchliff, had finished the spire and fixed the lightning conductor before the late thunderstorms, when a church in the neighbourhood (Holy Trinity), which was not furnished with a conductor, was injured. The lightning conductor on St. Mary's is a copper rope five-eighths of an inch in diameter, which is fastened to the outside of the spire on the north, and we hope communicates with the iron and copper work of the vane. The body of the church, consisting of a nave and two side aisles, is not yet roofed, and there will be several months' work to complete the edifice, which was commenced in November, 1854. The style of architecture is Early English. Mr. Crowther, of Manchester, was the designer. Mr. Foggatt, of Cheetham-hill, is the contractor for the woodwork, &c. There is a large chancel, also an organ-chamber. The walls are of brickwork and the pillars of stone. The roof of the chancel is finished in open timbered work, and the roof of the nave will be similarly constructed, with carved figures at the ends of the hammerbeams. The clerestory is lighted by five double windows on each side, and four staircases in the pillars will lead to the roofs. The east window is finished to the extent of the stonework: the west window is in course of construction. The church owes its existence to the liberality of the late Mr. Wilbraham Egerton, of Tatton-park.

Applethwaite.—The consecration of St. Mary's Church, Applethwaite, Windermere, took place on Friday in last week.

Edinburgh.—The restoration of old Greyfriars' Church is nearly completed, so far as its plain exterior is concerned, and the internal fitting up has been commenced. The intermediate pillars have all been removed, both on account of the injury they received in the fire, and their unsuitability for a Presbyterian place of worship. The building, therefore, seems to be one large Gothic hall, lit by an oriel window, and by lesser windows at the sides, and covered in with a high vaulted ceiling, supported by beams springing from the wall, and tying the roof at various points. The windows are to be of stained glass, executed by Messrs. Ballantyne and Allan, at the cost of the congregation, less the expense of the ordinary windows allowed by the town council. The church will be seated for 600 persons. The pews will be open, the sides being in the form of a pillar and panel. The pulpit, or rather rostrum (for the design partakes of the character of a lecturer's platform or desk, rather than of the usually confined limits of the pulpit), will be placed under the eastern window. The access to the church will be through the porch at the north-west corner, as at present. Within the porch will be a waiting lobby, and in the corresponding corner the vestry, the intermediate space consisting of a lobby screened off from, though within, the place of worship. Within this lobby will stand the ancient tombstones discovered in the recent excavations. The church, which is restored at the expense of the town council, supplemented by the congregation to the extent of several hundred pounds, is expected to be ready for re-opening early in the ensuing winter.

PROVINCIAL NEWS.

Yarmouth.—At a recent meeting of the Haven and Pier Commissioners, the clerk said, in reference to the bridge contracts, that he had received Messrs. Grissell's bill for the construction of the bridge. He had sent the original to Messrs. Walker and Burgess, the engineers under the contract for the commissioners. The total amount which Messrs. Grissell now claimed was 32,334*l.* 5s. 7d. The amount of the bridge contract was 23,734*l.* 10s. and Messrs. Grissell had received on account 23,467*l.* 5s. but they now claimed 8,599*l.* 15s. 7d. for extras. A committee was appointed to examine Messrs. Grissell's accounts, confer with the engineers, and appoint an arbitrator under the contracts, &c.

Windsor.—The *Windsor Express* states that the erection of several large villas will shortly be commenced on the Crown lands near Spittal; and that a scheme has been started for the erection of public baths, on a bye stream of the river leading to Clewer.

Brighton.—Tenders have been received for national schools, class-rooms, and offices, to be erected in George-street, Hove, under Mr. James Woodman, architect, Brighton. They ranged as follows:—Crowley, Hove, 970*l.*; Wisden and Anscombe, Brighton, 920*l.*; Fabian, Brighton, 890*l.*; Parsons, Hove, 890*l.*

The Lye.—According to the *Worcester Herald*, the Mechanics' Institution at the Lye, which now comprises about 100 members, have resolved to erect a proper building for the purposes of their institution. The foundation-stone was laid on Monday in last week, and the day was held as a holiday in that populous district. The design has been furnished by Mr. F. Smallman Smith, architect. The building is to have a front elevation of two stories in height, and to be built of red, blue, and white brick in pattern. It is to contain four rooms for the librarian, two good-sized class-rooms, an octagonal room in the rear, open to the roof, 30 feet in diameter and 28 feet in height. This room is also to be provided with a gallery to seat sixty persons. There will also be a lavatory, store-rooms, and all necessary conveniences. Mr. Ault, builder, Stourbridge, has taken the contract to erect the work (less the gallery) for 700*l.* The ground has been obtained on favourable terms. The subscription-list is in hopeful progress.

Cardiff.—The works in connection with the extension of the East Bute Docks are being pushed forward by the contractors, Messrs. Hemingway and Pearson. The present contract comprises 2,000 feet in length by 500 feet in width: the depth of the water when completed will be 25 feet. The quay-wall on one side is already finished. This part of the docks opened last year is about 1,000 feet long by 3,000 feet

wide. The contractors intend completing their present contract by November next.

Kidderminster.—The contractor for building the carpet warehouse and shed about to be erected for Messrs. Crane and Baston, in Vicar-street, is Mr. H. Ankrett, builder, Kidderminster, and the extension of the shed of Messrs. Dixon and Co. has been given also to Mr. Ankrett. The extension of this shed will be carried out at the back, for the purpose of accommodating about a score more steam Brussels looms, which require much space. The work has already been commenced. Messrs. Crane and Baston's ground will be nearly covered with compactly-arranged buildings, though not on a large scale; the front abutting upon Vicar-street, with a width of about 44 feet; the rear looking upon the Stour. The length from Vicar-street to the Stour is nearly 200 feet. The roof of the shed will be supported by iron girders and columns, after the usual fashion. The castings will be made at the foundry of Messrs. Austin and Brown, Clensmore. The chimney-stack will be 90 feet high, circular and tapering, with bands of blue and white brick, and an ornamental cap. The front elevation of the warehouse will be ornamental in its details, although in the peculiar character of a place of business. It will be four stories in height. This warehouse adds another to the many improvements in the street architecture of Kidderminster, introduced within the last few years.

Manchester.—The slow progress of the infirmary improvements, says the *Courier*, is becoming a standing joke in Manchester, and a by-word of reproach to the city. Certain improbable events are often prophesied as likely to occur when the fountains on Piccadilly are set playing. Some steps have recently been taken to forward the work, but the progress has seemed very slow to the public. The Peel Statue has long been doomed to a change, to satisfy the critical eyes of the lovers of art, who have complained of its want of elevation. It is to be raised 3 feet 6 inches, by adding another step to the pedestal, which will then be 15 feet high, and more consonant in appearance and proportion to the pedestal recently erected at the other end of the area for the Wellington monument. Mr. William Buxton, Great Bridgewater-street, has contracted for the alterations. The granite will be brought from Aberdeen, and it is shortly expected. The improvement will be made under the superintendence of Mr. Shorland, the city surveyor, the executive committee of the Peel Statue having handed over to the improvement committee of the city council the balance from the statue fund, that they might proceed with the alteration, subject to the approval of the sculptor, Mr. Calder Marshall. The figures will need a good cleaning before their re-erection, for they are begrimed with Manchester smoke.

Bradford.—The interior of St. George's Hall has lately undergone a renovation by Messrs. Briggs and Mensforth. The plaster ceiling, the pilasters, and walls have all been decorated, gold and colours having been applied. Several improvements have also been introduced in the interior arrangements. The erection of the large organ has necessitated the remodelling of the orchestra. It is now brought farther forward and carried higher up than at the last festival, and will be lighted by three coronas of light on each side, borne from the wall between each pilaster by large female figures. The benches on each side in the gallery have also been raised. A musical *soirée* was held last week with the view of trying the capabilities of the new organ, and the result, according to the local *Observer*, was satisfactory.

Scarborough.—A scheme is in progress for providing increased accommodation at Scarborough for bathers, in the shape of large swimming-baths (one for ladies and another for gentlemen), to be continuously supplied with sea water. Baths of every description will also be procurable at low charges. A large public assembly-room for concerts and balls, reading-rooms, and a winter garden, will also form part of the attractions of this new building. The Sanitarium, or Winter Garden, is to be formed out of the roof of the building, which is to be of glass.

Stockton.—This place is slowly assuming a new aspect. Within the last four or five years a good many improvements have been effected. A new gas company has been formed, and steam shipping companies established. Two iron-ship yards have been erected, as well as a new borough-hall and court of justice. A race-course has been laid out, and the town has been drained and rid of cesspools. The street and shop architecture is improving, and baths and washhouses are in contemplation.

Carlisle.—The new Industrial Schools at Harraby-hill were opened on 6th inst. by the guardians of the union, who have had them erected for the industrial education of children of the poor in Carlisle and its vicinity.

Alderney.—The Admiralty harbour works of the western pier are progressing, and the wall now measures 5,000 feet in length, from the tower on Grosnez Fort to the outer end. Twelve hundred workmen and sixty horses are employed on the pier and quarries; and four locomotive engines, two steam tugs, and a flotilla of boats and barges, are used to convey materials. A commencement has also been made with the eastern pier, which springs from the new fort at Château à l'Etoc, and is intended to run straight out to meet the extremity of the western pier, thus enclosing the two natural bays of Braye and Saye, except an entrance, 500 feet in width, facing the north-east. On the completion of this design, the harbour of Alderney, hitherto dreaded by mariners, will be all that can be desired as regards security, depth of water, and facility of entry, at all states of tide. The vote sanctioned by Parliament for the current year was 90,000*l*. The system of fortification pursued by the Royal Engineers from the War Department has been to erect a work on each of the headlands, so as to command the intervening bays by cross fire. Thirteen works of this character, mounting 160 heavy guns and mortars, have already been constructed: two are in progress, and others are projected to complete the system; while the cliffs on the southern shore, where not altogether precipitous, are proposed to be made so as to render the island inaccessible on all sides. The two forts in progress are on Mount Touraille and on Essex-hill; the former an extensive work, to carry thirty-five guns, with accommodation for 500 men, and overlooking the harbour and entrance; the latter, a reserved barrack for 250 men. The new works on Touraille and Essex-hill employ nearly 700 workmen, making a total of 1,900 men employed on the public works of the island. The population of Alderney, numbering 1,000 souls in 1846, is now increased to 6,000.

NEW CHURCHES.

The 36th annual report of Her Majesty's Commissioners for Building New Churches, says:—

"Her Majesty's Commissioners in their last report stated that 597 churches had been completed, in which accommodation had been provided for 581,155 persons, including 350,349 free seats for the use of the poor.

They have now to state that eighteen churches (in addition to those then reported) have been, by the aid of grants from the funds placed at the disposal of Her Majesty's Commissioners, since completed, at the following places, viz.—At Cinderhill, in the parish of Basford, in the county of Nottingham; in the parish of St. George, Birmingham, in the county of Warwick; in the district of Tonge, in the parish of Bolton-le-Moors, in the county of Lancaster; in the district of St. Paul Pudsey, in the parish of Calverley, in the West Riding of the county of York; in the district chapelry of Smethwick, in the parish of Harborne, in the county of Stafford; at Mildmay-park, in the parish of Islington, in the county of Middlesex; in the district of St. Andrew, in the district parish of St. John, Lambeth, in the county of Surrey; in the district of Brewery Field, in the parish of Leeds, in the West Riding of the county of York; in the parish of Milton-next-Gravesend, in the county of Kent; at Craven-hill, in Warwick-road, and in Westbourne Park-road, all in the parish of Paddington, in the county of Middlesex; in the district of St. Matthew, Chadderton, in the parish of Prestwich, and at Pinfold, in the parish of Rochdale, both in the county of Lancaster; in the district parish of St. Mary Haggerstone, Shoreditch, in the county of Middlesex; at Balham, in the parish of Streatham, in the county of Surrey; at Brampton Bierlow, in the parish of Wath-upon-Dearne, in the West Riding of the county of York; and in the parish of Whitby, in the North Riding of the county of York.

In these eighteen churches accommodation has been provided for 14,963 persons, including 7,290 free seats for the use of the poor, as far as the same can be at this time exactly ascertained.

Thus, in the whole, 615 churches have now been completed, and provision has therein been made for 599,118 persons, including 357,639 free seats for the use of the poor."

LONDON IMPURITIES.

The Registrar-General, in his last Return, after showing that the inhabitants of London are not in an average state of health, and speaking of the evils of smoke and of the dust of the street, says,—

"The third class of atmospheric impurities is invisible, but it arises from the long retention of the excrement of London under the houses and in the sewers. According to the estimate of Mr. Lawes, London could supply the farmers of England daily with 29 tons of ammonia, 51 tons of carbon, 14 tons of phosphates, 32 tons of mineral matter, and 14 tons of other matter, making in the aggregate 140 tons of dry manure, dissolved naturally in about nineteen times its weight of water. The country requires this precious manure, which London is anxious to get rid of at any reasonable cost, as it is now known to be as insalubrious as it is offensive.

The problem for the engineer to solve is, How can 3,000 tons of town guano be returned daily to the disinfecting soil, from which it was chiefly taken, with the least offence to health, and with the least cost? Shall it be distributed by pipes, or by railways? Shall it be disinfected by water, earth, ashes, or any chemical compound?

Under the present arrangements some hundreds of thousands of tons of this matter lie in store in London, putrefying in cesspools and percolating the streets, while the residue is thrown into the Thames at great cost.

All these impurities of the air we breathe in London have evidently a natural tendency to increase more rapidly than the population, and can only be removed by the vigilance, intelligence, and energy of the Board of Works.

Every substantial sanitary improvement they effect will be as evident as the diminution in the mortality of the districts which now receive a purer water, and which will, it may be expected, ere long receive it on the system of constant supply."

MIDDLESEX INDUSTRIAL SCHOOLS COMPETITION.

The letter in your last number, signed by Mr. "P. Northall Laurie," enables us to appreciate at their proper value the thanks which the committee gave by their advertisement to those who had furnished them with the designs, which, according to Mr. Laurie, were so "complete a failure," and the "worse than mediocrity" of which so "astounded" the referees.

It is not of course for me to say how far Mr. Laurie's accusations are well founded, but when he blames the competitors for want of "confidence," he does not assuredly lay himself open to a similar imputation, as he hesitates not to pronounce most dogmatically on the merits of designs which, I will engage to say, have cost their authors far more time and thought than Mr. Laurie has thought it necessary to expend in order to qualify himself to condemn them so sweepingly.

Mr. Laurie states, with much *naïveté*, and as a claim, I suppose, for being considered just and impartial, that out of the *seven* selected by the referees, *one* received the *lowest* premium: he does not give us any idea why the committee overruled the decision of their professional advisers, as regarded the *two first* premiums; nor does he attempt to explain how it happens that the committee have themselves chosen the two first designs (which were not among those selected by the referees as being, according to Mr. Laurie, the "least bad"), and have then decided that these designs are not worthy of adoption.

Mr. Laurie seems disposed to adopt the tone of an ill-used man, but when any person complains that every one quarrels with him, we are not long in

appreciating the real state of the case. Mr. Laurie quarrels with all the forty-one competitors: he quarrels with the referees: he quarrels with the recipients of the premiums; and, finally, seems disposed to quarrel with the whole profession, and even with every one who builds. Surely, it might have occurred, even to a Middlesex magistrate, that it was just possible that all these different personages might not be so entirely wrong, and he alone completely in the right!

A Competitor.

SCOTTISH ARCHITECTURE.

I had thought that in the present day both the architecture and the history of Scotland were pretty well known; but it would seem, judging from Mr. J. H. Burton's paper, read, as I see by your pages, at the meeting of the Archæological Institute at Edinburgh, there is still a pretty wide field of information open to be gone over. As to his wild theories of the War of Independence being a struggle of Saxons against Norman aggression, it would be only making waste paper of your valuable space to bring against it the information every one has at command; while also the real examination of the baronial castles themselves would have shown that in almost every case the peculiarities of the style were forced on the builders from the materials at their command and the requirements for space inside, taken in connection with the state of society for the time being. Look at a piece of Scottish and a piece of English corbelling, and observe the difference. See how the Scot, not tied for stone, corbelled out in quarter-round and fillet, again and again. See how the English architect made the most of his by making a bracket here and there, and bridging between, and so on throughout the whole of these buildings. At the same time, as in England, there are a few buildings which may have been derived from abroad; but even in Scottish ecclesiastical architecture, when we might naturally have supposed this to be the case, it does not very often occur. A list of a few on the east side of Scotland, may give an idea of about the proportion.

Part of Holyrood Chapel, Early French. At St. Andrew's, the entrance lobby to Chapter-house, including door into same, but not Chapter-house, Early French Decorated. A base in south transept, French Late Flamboyant, and part of west front same date as lobby. At Aberdeen, columns to central tower, German Decorated. Stalls to King's College, Perpendicular, seemingly north Holland work; as also is the Rood Screen (painted), at Foulis Easter, in Forfarshire. At Elgin, the only foreign bit is a bishop's tomb, in the south aisle of choir (probably a Stewart), which appears to be German Early Perpendicular. All the rest of these buildings, as others, such as Haddington, St. Giles, Linlithgow, Stirling Church, St. John's, Perth, Pluscardin, &c. appear to have nothing foreign in them. I leave out Roslyn as being by an architect brought from abroad, and a very exceptional case, and St. Magnus, at Kirkwall, which was almost entirely Norwegian. Indeed, the last has peculiarities never found in France, as in its unique (I conjecture ?) foliaged columns, and its dragon ornamented bases.

A Descendant of one of those anything but Saxon Men who had the honour of fighting against the First Edward.

METROPOLITAN ASSOCIATION FOR IMPROVING THE DWELLINGS OF THE INDUSTRIOUS CLASSES.

I read with much interest the article on lodging houses in your valuable publication of the 19th ult. in which "Quondam" states that "The Royal Metropolitan Association does not answer the end for which it was chartered," and alludes to the high rent of the Ingestre Buildings.

The same reason, viz. the central position of these houses, which your correspondent says keeps them always full, enhances the value of ground-rent payable in such localities, and necessarily increases the rent to the tenants.

Your correspondent also alludes to the building in Platt-street, Old St. Pancras-road, and supposes 2½ per cent. a liberal allowance for expenses of management. On reference to the reports and audited accounts, taking an average of three years, you will find the charges and necessary outgoings upon these buildings amount to 4⅗ths per cent. exclusive of their proportion of office expense, amounting to ¾ per cent. which latter sum is, in fact, the cost of management.

Looking at what this association has accomplished, and is still engaged in carrying out, and bearing in mind that it was the pioneer of this movement, now assuming a national importance, I am instructed by the Directors to address this letter to you, differing in opinion as they do with your correspondent, whose letter you have inserted.

Charles Gatliff, Secretary.

THE ARCHITECTURAL MUSEUM, CANON-ROW.

This collection has been recently increased by another addition of highly-interesting casts from Notre Dame, Paris. The committee have secured these specimens through the influence of M. Gérente, of Paris, one of their corresponding members, who took advantage of the opportunity offered for such a purpose during the decoration of the cathedral for the baptism of the Imperial Prince.

METROPOLITAN BUILDING ACT.

EXEMPTED BUILDINGS.

On the 7th inst. Mr. John Kirtland appeared before Mr. Dayman, at the Hammersmith Police Court, to answer an information under the Metropolis Building Act, charging him with having erected certain buildings without having given the usual two days' notice to the District Surveyor, whereby he had incurred a penalty of 20*l*. The district surveyor for South Kensington said the buildings in question, which were now in the course of erection, were in an avenue leading from the Warwick-road. He received no notice of the intended building, and only heard of it by a "discovery."—The defendant said the reason he did not give notice was, that he was employed under the London and Birmingham Railway Company, and he understood that he was not bound to give notice. There was a clause in the Act which exempted him from giving notice when the building was for the use of a railway.—The surveyor said, as far as he understood, these buildings were offices of the South Yorkshire Coal Company. The offices were not built for the Birmingham Company, but for another, and a coal company.—Mr. Dayman said that if that were the case, he was of opinion that a notice must be given, for it could not be contended that they were erected for the use of the West London Railway.

The question was adjourned, and on the 14th was heard again, when it was contended, on the part of the district surveyor, that the buildings or offices were not for the use of the Birmingham Railway, but for the benefit of the South Yorkshire Coal Company.—Capt. Huish, the general manager of the London and North-Western Railway, stated that the West London Railway was leased to the London and North-Western. The offices in question were erected by the latter company for the convenience of the coal-dealers to carry on their trade. They received no remuneration for the use of the offices, and they would have to pay for the erection of them. The only remuneration they received was by the tolls chargeable upon carrying the coals upon their line.—The district surveyor said, as a public officer, he had considered it his duty to bring this case forward. When he discovered the buildings in the course of erection he wrote to the builder that he was entitled to notice, and that he had not received any. No answer was returned, and the only course he had to pursue was to summon the defendant to prove his exemption.—Mr. Dayman considered the exemption had been proved, and dismissed the summons, but refused to allow any costs to the defendant, on the ground that he had not given the information to the surveyor.

Notices of Books.

The New Law and Practice of Joint-Stock Companies, with and without Limited Liability. By Mr. Edward W. Cox, Barrister-at-law. Second Edition. John Crockford, Essex-street, Strand. 1856.

Mr. Cox calls his well-timed volume a second edition, but it is in truth a new book, the law lately passed for the regulation of Joint-Stock Companies having compelled the re-writing of nearly the whole of it. Especial reference is made to Limited Liability, and pains are taken to show how an individual trader may avail himself of it, to compete with companies who would otherwise have an advantage over him. This is the plan:—

"It is founded upon the peculiar feature of the new law, which does not assign any certain number or amount of shares, nor the subscription of any number of the shares, or of any portion of the capital, as a preliminary to incorporation and the commencement of business.

Bearing in mind this state of the law as it is now, let it be supposed that a trader, say a draper or a grocer, desires to secure the privilege of limited liability, and so to fight on even terms with his rivals having that privilege. He can do so, in effect, thus. Let him convert his business into a Limited Liability Company, with so much capital as he is willing to stake, say 1,000*l*. in 1,000 shares of 1*l*. each. As the company must consist of seven persons at least, he has but to give one 1*l*. share to each of his children (if of age), brothers or sisters, parents or servants, and keep the remaining 994 shares himself, and so he will obtain the advantages of incorporation, and the privilege of not being liable for any of his debts or contracts beyond the 994*l*. or whatever the sum might be, at which he has fixed his own liability; and if this is paid up or registered as paid, he has no liability at all.

It is not even necessary that he should take up all the shares. If he desires further to restrict his liability, he has only to take a portion of them."

It is to be hoped that only the honest may avail themselves of it.

The name of Mr. E. W. Cox gives this book assurance of correctness.

Painting with both Hands; or the Adoption of the Stereoscopic Principle in Art as a Means to Binocular Pictures. By John Lone. Chapman and Hall, Piccadilly. 1856.

"Let not thy left hand know what thy right hand doeth," is the significant motto of this somewhat curious and original pamphlet. Perhaps the apocryphal "lawyer's clerk" might have found still better or more appropriate ones in the Apocrypha than in the orthodox Scriptures, as for example,—"All things are double, one against another," for "two are better than one; for when they fall the one will lift up his fellow,"—at all events, the apocryphal texts would have well assorted with the apocryphal idea; but though this idea may be regarded by many as a doubtful one, there is really some verisimilitude in it. Perhaps the moot question whether it be possible to produce stereoscopic effects with a single photograph should have first been decided in the affirmative (if it ever *will* be) ere such an idea were started; but it cannot be difficult for some artist to test the truth of Mr. John Lone's idea: indeed, although as yet almost exclusively speculative, he tells us that one artist *has* put the matter to proof, and with good approximative effects; but not exactly by any of the methods he himself had in view; the artist having used the brush with both hands at once, thus, decidedly, not only letting the left hand know what the right hand was doing, but allowing it to help "its fellow" to do it. This is really but a modification of Mr. Lone's principle, however, after all, and he anticipates various ways of carrying it out, as by using the left eye along with the left hand exclusively in working out the left sides of the stereoscopic picture, and the right eye with the right hand for the opposite sides. The author adduces in favour of his idea such facts as that "straight, sharp, and manifestly *single* lines have no place in works of art,"—that pictures painted virtually by one eye and one hand are best seen by shutting one eye and entubing the other,—that such pictures are often looked at in reverse in a mirror, in order that their right-handedness may be reversed, and their accuracy or truthfulness to nature be judged of,—and so on. Fanciful as the idea may be, it is clever, and the pamphlet is well written.

Miscellanea.

Moveable Wooden Houses for the Poor of Paris.—The working population, chased from their homes by the demolishers of Old Paris, are told, says the Paris correspondent of the *Morning Herald*, that the question concerning lodgings for the poor is at last in the way of being settled. M. Teiret, a Swiss manufacturer, has presented models of moveable wooden houses, which have been approved of in the highest quarter. According to the system proposed, a wooden house, capable of lodging two large families or four small ones, may be had for 600 f. a year. By this method a family will only pay 300 f. a-year rent, or four workmen without families may be well lodged for 150 f. each.

Fall of a Chimney at Manchester.—On Thursday in last week the chimney of the "Old Factory," Miller-street, a square stalk 100 feet high, fell, and caused narrow escapes to the lives of several persons. New buildings were in course of erection on the site of the old factory, and it was intended to pull down the chimney. In excavating for the new premises the foundation of the chimney had been undermined. A stable and some premises adjoining were completely demolished, and a pony in the stable was killed.

Chronological Arrangement of Tapestries.—In an able and very interesting article on "The Tapestry of the Middle Ages," in the current *Journal of the British Archæological Association*, Mr. Planché makes a suggestion which ought to be carried out into a fact. Mr. Planché says,—"It is much to be desired that specimens of the twelfth, thirteenth, and fourteenth centuries should be procured when opportunities occur, and placed at Hampton-court, to complete a series. There are, or were, other tapestries in the royal palaces of Windsor and St. James's, of the seventeenth century; relics of the time of the Charles of England and Louis of France. Examples of the later establishments of Mortlake and St. Cloud, which, with one of the geographical pieces woven at Burcheston (some fragments are reported to have been in Walpole's collection at Strawberry-hill), would, chronologically arranged, form, with those above mentioned, a collection of the greatest interest to the antiquary, the artist, and the manufacturer. The importance of such classified exhibitions has been proved in several recent instances. The magnificent display of objects of mediæval workmanship at the rooms of the Society of Arts, in the Adelphi, 1850, was a triumphant experiment; but its success, however great as a spectacle, would not have been so beneficial as it has proved to art, so instructive as it was admitted to be to all, had not the arrangement facilitated comparison, and exhibited so clearly the progress of design and execution, the spirit of beauty struggling through the dark ages, and asserting the power of genius under the most disadvantageous circumstances."

Ephesus, and the Temple of Diana.—Ephesus, the port of Ionia, situate on the river Cayster, was, during the whole period of classical antiquity, a place of the highest importance. Owing to its favoured situation it became the mart of commerce of Asia Minor, and here was exchanged the produce of Greece and Egypt with that of the Persian empire and inner Asia. Its final destruction, which happened A.D. 262, cannot fail to impress the mind of the philosopher and the Christian, who think of its former glory, its Christian celebrity, and its final desolation. The early colonists introduced with them the worship of the Goddess Diana; but owing to the connection of Ephesus with central Asia, an Oriental character was gradually given to her rites. Her temple, built at the joint expense of all Asia, was esteemed one of the seven wonders of the world, not merely from the engineering difficulties which its builders had to overcome, but on account of its magnificence and grandeur, the purity of its architecture, the beauty of its sculptural adornments, and the extraordinary collection of works of art, in painting and sculpture, which it contained. Mr. Edward Falkener has prepared a work illustrative of the city of Ephesus and its world-famous temple, and only waits for a certain number of subscribers to send it to press. We may safely recommend the lovers of classical art and learning to send him their names.

Gas.—The Bury St. Edmund's Gas Company have declared a dividend of 10 per cent. on their shares, free of income-tax.——The new gas-works at Chipping Norton are in progress. They are to be in full work by the 1st of October.——The gas consumers at Shoreham have been very indignant with the West Brighton Gas Company for continuing to charge them 7s. 6d. for their gas while reducing the price to the Brighton consumers to 5s. On publicly remonstrating with the directors, a reduction of 1s. was granted; but this was not considered sufficient, and nearly every gas consumer in the town signed a requisition for a further reduction, which, however, the directors are said to have refused.——Arrangements are being made by which tallow will be superseded by the introduction of gas into the workings of the Balleswidden mine.

Alnwick.—The Duke of Alnwick is having quite an architectural re-union at Alnwick, the Cavaliere Canina being there, as also Messrs. Salvin, Cockerell, and Donaldson. It is said that the duke purposes affording the members of the Institute every opportunity of visiting the castle, and seeing the works now in progress.

The late Mr. Thomas Hopper, Architect.—We must content ourselves on the present occasion with simply noting the death of Mr. Hopper, at an advanced age, and will take another opportunity to place before our readers some particulars of his career.

Stone-cutting.—In April, last year, Messrs. J. and P. Hunter, Leysmill, patented a stone-cutting machine, which it is said materially simplifies manual labour. The machine is 11 feet in diameter: upon it there are twenty-four tools, or teeth, fastened, as the patent runs, to an equal number of holders—and, at the rate of 7 inches per minute, it cuts a stone (the "old red sandstone" of Forfarshire, for instance) be it in thickness an inch or 5 feet. The machinery is very complicated in appearance, but, after explanation, is easily managed.

The Statue in the Royal Exchange.—Pray notice the neglected statue, in the Royal Exchange, of our excellent and gracious Sovereign. What a shameful and dirty state it is in, nearly as black as coal: it would puzzle an antiquary to give an opinion of what it is composed. It is much to be lamented that this work of art should remain in its present state, and by no means creditable to the taste of the authorities.—J. W.

The Wallace Monument.—The subscriptions for this Scottish monument are said to be readily flowing in. There are already 1,000*l.* on the Stirling books, and a large sum has been collected in Glasgow. Letters have been received from our American and other colonies sympathizing with the movement: influential colonial committees are being formed, and large subscriptions are anticipated. It is said that several English artists of eminence have visited Stirling to examine the proposed site, with the view of giving designs; and that Mr. Noel Paton has resigned his place on the committee, and announced his intention of entering the lists as a competitor.

Lord Mayor's New Court.—The City Corporation has decided on building a new court for the Lord Mayor. Workmen are laying the foundation of the new building at the west-end of Guildhall. The ancient crypt is to be appropriated as a museum.

Westminster-bridge and the Vestry of St. Mary's, Lambeth.—At a vestry meeting, held on the 14th inst. a motion by Mr. Frederic Doulton was considered, to the effect that the proposal in the report of Messrs. Rendel and Simpson, to stop entirely the thoroughfare over Westminster-bridge during five years, while the new bridge is constructing, and to divert the traffic over a new bridge between the Horseferry-road and Church-street, Lambeth, is one calculated to inflict enormous injury upon the inhabitants of Lambeth, and to cause very great inconvenience to the public generally; that the present condition of the bridge is dangerous in the extreme, and there is great risk that the bridge will give way, without any provision whatever for temporary accommodation to the public; and that the navigation of the river is most prejudicially affected by the present state of the bridge. The motion concluded with a proposal to appoint a committee of eight vestrymen to consider and report on the best means to prevent the carrying out of Messrs. Rendel and Simpson's proposal. Mr. Doulton, in supporting the terms of his motion, suggested that the committee should urge on Government the necessity of having a temporary bridge while the new one was constructing, and which would cost about 35,000*l.* Mr. R. Taylor said he hoped the committee to be appointed would keep in view the necessity of building a bridge between Horseferry-road and Church-street, Lambeth, and also of re-building Westminster-bridge on the present site. The motion was ultimately agreed to, and the committee appointed.

Lincoln Architectural Society.—The annual meeting of the Architectural Society for the diocese of Lincoln, will be held at Mansfield towards the end of September.

New Church and Schools at Holloway.—The new Metropolitan Cattle-market at Holloway, having induced many persons to commence building in that neighbourhood, Mr. Thomas Poynder has given a site sufficient for a church, schools, and parsonage-house; and Mr. Alfred Batson, the proprietor of an estate in the district, has given 1,000*l.* towards the erection of the church. The Incorporated Church Building Society has also made a liberal donation.

Paris Crystal Palace Company.—A meeting of this company has been called for the 26th inst. to consider a proposal for selling the undertaking to the State, and dissolving the company.

The Steel Monument, Carlisle.—At a meeting of the town council of Carlisle, on 12th inst. Mr. Beadle moved, "That the design for a monument to the late James Steel, Esq. submitted to this meeting be approved of." After some discussion, the motion was carried against an amendment by a majority of 16 to 12. A site in the market-place, where some old buildings were lately pulled down, has been granted for the purpose of erecting the proposed statue there.

Stained Glass.—Mr. Wilmshurst, of Foley-place, has just completed and fixed a memorial window in Sydenham Church. It contains four subjects, namely,—the Nativity, the Offerings of the Magi, the Presentation in the Temple, and Christ Disputing with the Doctors,—each subject surmounted by a canopy.

Scavenge the Thames.—The question is asked in the *Builder* of the 9th, "Who shall scavenge the River Thames?" I think the convicts might be profitably set to work, both to scavenge and deepen the river, believing it would give general satisfaction to the public in thus employing the pests of society.

W. P.

Casting Iron and other Metals.—Mr. Henry Adcock, of the City-road, has invented an improvement in casting, which consists in employing highly-heated moulds, and in causing such moulds to be heated on all sides and at the bottom, by the heated air in the oven or muffle. After the moulds are dried, the fire is to be increased, until they are brought to a very high degree of heat, when the iron or other metal is run into them.

Antiquarian Discovery at Yarmouth.—A painting in distemper in good preservation has been discovered in South Burlingham Church, whilst some workmen were scraping the south chancel wall. It represents the assassination of Thomas A'Becket. The figures are outlined on the stucco, and three-quarter life size. St. Thomas is depicted in the act of kneeling before an altar (in a Gothic building), on which is a chalice: a cross-bearer—probably the faithful Edward Gryne—holds a processional cross in his left hand, his right being elevated in amazement and horror. Four armed knights are assailing A'Becket. On the extreme right is a tree. The armour is depicted in the style of the reign of Richard II. of which time the painting probably dates. All the details are minutely represented.

On Railway Signals.—We are told that the following mode of signalising has just been introduced into America by an Englishman, who could not get the consent of any company in London to its being adopted on their lines, even at the expense of the inventor. It is intended to supersede the use of coloured signals on posts, dependent on the eye alone, where often one false blink or inattention might hurry hundreds into eternity. To obviate the use of the eye, the ear is called into requisition. Each train is furnished with a swinging flap hanging down in front of the locomotive and break-van, nearly the *width* of the rails, and within a few inches of the ground. The upper part of this iron swinging door is connected with chains or rods, by cranks or pulleys, to a whistle on the engine, or to a bell or gong on the break-van, &c. so that any obstacle placed between the rails, whether premeditated or otherwise, must cause the flap-door in front to be lifted up in passing over it, and in doing so must pull the crank and sound the alarm to arouse the officials to a sense of their duty, &c. Then instead of the coloured signals on posts being used, and which entirely depend upon a good look-out, it is proposed to remedy that plan by fixing at certain places simple iron cranks longitudinally between the rails, so that when danger is ahead, these temporary elevations are raised, which must be struck by the pendulous door of the passing train, thereby causing the whistle or bell to sound the alarm, whether in rainy, foggy, or dark weather, without the necessity of being perpetually dependant on the sight to ascertain danger ahead, &c.

Metropolitan Street Tramways.—Several correspondents urge that we should recal attention to the fact, that the street tramways for horse carriages or omnibuses and other traffic, advocated in a leading article the other day in the columns of our great contemporary the *Times*, have from time to time been advocated in our columns, and particularly at the Great Exhibition time. As we have before noted, such a system does not require to stand trial as an entire novelty, having years since been introduced into the streets of the principal cities and towns of the United States of America. In Paris also it has been introduced. Lines of rail flush with the surface of the street, might be laid so as not to be in the way of the general traffic, but rather for its behoof, while also more particularly used by a special class of passenger and other carriages. A trial on a limited scale might easily be made without the least interference with the general traffic of the streets except in laying down the tramways.

ADVERTISEMENTS.

LOCAL BOARD of HEALTH for the BOROUGH of BRADFORD.—To SURVEYORS and OTHERS.—WANTED, in the Office of the Surveyor and Waterworks Manager of this borough, a competent person to act as CHIEF CLERK and ASSISTANT. He must be capable of taking levels, and must be a neat and expeditious draughtsman. A person having had experience of the method of conducting the business in the Surveyor's Department under a Local Board of Health, and possessing a knowledge of the most approved methods of drainage, will be preferred. He will be required to devote himself exclusively to the duties of the appointment. Salary 120*l* per annum. Applications may be forwarded stating age and previous occupation, accompanied by testimonials of character and competency, on or before the 30th of AUGUST instant.—By order, W. H. HUDSON, Town Clerk.

Bradford, Yorkshire, August, 1856.

ROTHERHAM and KIMBERWORTH LOCAL BOARD of HEALTH.—WANTED, a SURVEYOR, competent to discharge the duties arising under the Public Health Act, 1848, in the said parish, which comprises the townships of Rotherham and Kimberworth. Information as to the precise nature of the duties may be obtained on applying to the Clerk. Candidates are to state their age, previous occupation, and the salary they would expect to receive, but are not required to attend personally until summoned. All applications for the above appointment are to be made in writing, and sent, together with the testimonials of the parties applying, to the Clerk, on or before THURSDAY, 28th instant.—By order,

JNO BARRAS, Clerk.

Howard-street Rotherham, 20th August 1856.

N.B The person appointed will be restrained from acting as architect or surveyor within the district.

A BUILDER has a VACANCY in his Office for a JUNIOR CLERK.—Address, by letter only, stating age, and where last employed, to T. O. M. Post-office, 179, St. Pancras-street, Chelsea.

AN ARCHITECT and SURVEYOR in the Midland Counties has a VACANCY in his Office for a PUPIL of steady habits and good ability. A moderate premium required. References exchanged.—Address, "CLERICUS," 7, Chapman Brown's, Bookseller, "Bible and Crown," Fleet-street.

AN ASSISTANT WANTED, in an ARCHITECT'S OFFICE, well acquainted with the different styles of architecture, and quite competent to make out finished and detail drawings. He must also have a taste for design, and a knowledge of construction.—Address, stating full particulars of qualification, where recently engaged, and salary required, to C. D. No. 62, Berners-street, Oxford-street.

TO PARENTS AND GUARDIANS.

MESSRS. BALAM and LEE, Surveyors, No. 15, Buckingham-street, Adelphi, London, have a VACANCY for an articled PUPIL. For particulars apply by letter.

WANTED, by an ARCHITECT, an ASSISTANT, well acquainted with the practical part of the profession, and a neat draughtsman.—Apply, by letter, stating terms, and where last or may be engaged, to X. X. Mr. Lock's Library, Gray's-inn lane, Holborn.

TO PAINTERS AND DECORATORS.

WANTED, immediately, a trustworthy and experienced MAN, either to take the management of, or as principal foreman, in a House Decorator's Establishment. He must have a good address, be a good grainer, marbler, &c. and have a thorough knowledge of the business of a house decorator in all its branches. The situation will be permanent, and the wages liberal. No person need apply who is not able to procure good testimonials as to character and abilities.—Address, stating wages expected, to G. GEORGE COOPER, Northumberland Decorative Works, Newcastle-on-Tyne.

WANTED, in a Country Timber and Building Yard, a YOUNG MAN of business habits, to effect sales, superintend the work, and keep part of the books. Hours from 7 to 6. One accustomed with the retail department would be preferred.—Apply, by letter, in own handwriting, stating age, reference, previous occupation, and expected salary, to W. W. Post-office, Maldon, Essex.

WANTED, one or two first-rate SASH-MAKERS, to take the sashes, frames, and shutters of four first-class houses. A reference to some known firm will be required. Apply by letter to "A." Miss's News Office, Hampstead.

WANTED, an ENGAGEMENT as GENERAL FOREMAN or CLERK of WORKS, by an experienced Man, who has lately had the superintendence of very extensive Sewer of buildings in London.—Ample testimonials as to ability, sobriety and attention to business can be had, if required.—Address, P. Q. R. Office of "The Builder."

TO MASTER-PAINTERS, BUILDERS, &c.

WANTED, a constant SITUATION, by a Young Man, a PAINTER; can turn his hand to a little graining. Wages, 4*s.* per day.—Address, C. C. Office of "The Builder."

TO SAW-MILL PROPRIETORS.

WANTED, by a steady, middle-aged Man, a SITUATION as SAW SHARPENER; he has had charge of one, and has done the repairs for the last three years. The best references given, in town or country.—Address to WM. BROWN, at Mr. White's, No. 101, Brook-street, Ratcliff.

TO MASTER-BUILDERS, &c.

WANTED, by a Young Man, EMPLOYMENT in the PAINTING and GLAZING, &c.; can make himself useful at the plumbing, &c.; or he engage himself as a Plumber's as an improver, in town or country. Wages not so much an object.—Apply to B. P. 3, Jubilee-street, Mildmay-park, Stoke-Newington.

TO SAW-MILL PROPRIETORS, BUILDERS, AND OTHERS.

WANTED, by the Advertiser, a SITUATION as FOREMAN; he is practically experienced in engine-work, saw-sharpening, and all kinds of saw mill machinery; is strictly sober. First-rate testimonials.—Address, G. W. No. 31, Brunswick street, Cross-street, Blackfriars-road, Surrey.

TO BUILDERS, OR OWNERS OF SMALL HOUSE PROPERTY.

WANTED, a SITUATION, by a steady Married Man, by trade a Painter, but has had great practice in the general repairs of small house property. Will be glad to make himself generally useful. Wages not so much an object as a permanent situation.—Address, by letter, A. B. Mr. Hoods, Grocer, Notting-dale, Kensington.

TO PLUMBERS, PAINTERS, AND OTHERS.

WANTED, by a Young Man, aged 23 years, a SITUATION, in a GENERAL SHOP, where he can make himself generally useful in plumbing, painting, and glazing. Can give good reference if required.—Address, C. B. No. 9, Union street, Walcot place, Kennington-road.

TO PLUMBERS, BUILDERS, AND THEIRS.

WANTED, by a first-rate PLUMBER, a constant SITUATION. No objection to town or country. Good reference if required.—Address, W. L. at Mr. Morris's, 11, Perry Field-place, Maidstone, Kent.

TO DECORATORS GRAINERS, BUILDERS, &c.

WANTED, a SITUATION, by a Young Man, from the country, who has been eight years to graining and painting and has a knowledge of drawing ornament. Direct, W. G. Office of "The Builder."

WANTED, by an experienced Carpenter and Joiner TASK-WORK of any description and quantity, in town or country. No objection to take the Sub-work of a Builder's Shop.—Address, A. H. 2, Albert-grove, South Hackney, London.

WANTED, by a first-rate STAIRCASE HAND, a permanent SITUATION, or to take any quantity of stairs, capped rails to stone and other stairs, having been employed in extensive works. First-rate testimonials can be given.—Address, post paid, to J. L. 19, Stevenson-terrace, Caledonian-road.

TO SURVEYORS, CIVIL ENGINEERS, AND OTHERS.

WANTED, by a Young Man, a RE-ENGAGEMENT in an office of the above. Satisfactory references as to character and ability from last employer. Salary moderate.—Address, A. D 306, Regent-street.

TO ARCHITECTS, BUILDERS, CONTRACTORS, AND OTHER CONSUMERS OF GLASS.

HARTLEY'S PATENT ROUGH PLATE GLASS,

1-8th of an inch thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th or 4 lbs. is now universally used for

RIDGE AND FURROW ROOFS, GREENHOUSES, RAILWAY STATIONS, MILLS, MARKET HALLS, BATHS AND WASH-HOUSES, FACTORIES, WORKSHOPS, SHIP-BUILDING SHEDS, AND OTHER EXTENSIVE BUILDINGS.

By a carefully prepared Estimate, it has been ascertained that FOUR-FIFTHS of the ROUGH PLATE, or non-transparent Glass, consumed in the United Kingdom in 1854, was manufactured by HARTLEY'S PATENT—thus affording the most incontestable evidence of its superiority over every other article of the kind, and as being the only description of Glass suitable for the purposes above named. It combines size and strength with economy of cost, and is manufactured in sizes expressly for RIDGE and FURROW ROOFS, giving a SPAN of TWELVE FEET, at a price not exceeding, weight for weight, that of Common Crown Glass. Its non-transparency renders BLINDS UNNECESSARY, and no scorching occurs in Greenhouses glazed with it; hence the preference given to this Glass for all Horticultural purposes.

For further particulars, apply to

JAMES HARTLEY AND CO. SUNDERLAND; AND PURFLEET WHARF, EARL-STREET, BLACKFRIARS, LONDON.

Sole Manufacturers of Lockhead's Patent Perforated Glass for Ventilation.

*** *Hartley and Co.'s Glass Tariff Newspaper will be forwarded gratis, on application.*

FACING FOR BUILDINGS COMPANY—TAYLOR'S PATENT.

BUILDINGS PERFECTLY RESISTANT TO WET WITHOUT ADDITIONAL EXPENSE, OR THE USE OF COMPO,

REQUIRING THE CONSTANT EXPENSE OF PAINTING. EXTERNAL WALLS FACED WITH AN INDESTRUCTIBLE MATERIAL

STONE-FACED BUILDINGS AT LITTLE MORE COST THAN CEMENT.

No necessity for Iron Cramps and Bond stones, and the Stone Ashlar never or rarely requires repointing by the settlement of the Mortar-joints of the inside Brickwork. The INSIDE of CHURCHES and OTHER BUILDINGS FACED WITH STONE instead of Brick. Also Dormer-heads, Ladders Staircases, &c. of Private Residences. It can be had ready for fixing from the quarries at a small cost for carriage, or, if required, it may be worked with the ordinary Bricks of any locality, under the ordinary workman. The CHURCH faced inside and outside in this manner, and the other Buildings at SPRING GROVE, HOUNSLOW, and elsewhere, can be inspected, and all particulars obtained, of

Mr. JOHN TAYLOR, ARCHITECT, OFFICES OF THE COMPANY, 40, KING-STREET, CORNER OF CHEAPSIDE.

Erected in London upwards of 20 years since, are now as sharp and perfect as when first manufactured.

Drawings on application to

H. DOULTON & CO. High-street, Lambeth.

VENTILATION.—PURE AIR.

Sheringham's Ventilator for the admission of pure air through an

EXTERNAL WALL.

With single pulley, from 6s. each; with leading pulley, from 8s. 6d.

These Ventilators are arranged that the requisite quantity of air may be admitted for the due ventilation of an apartment without the slightest draught being felt by the occupants; and as they are placed in the external wall, their action is not impeded when the house is closed for the evening, at which time a constant supply of fresh air is most required.—HAYWARD, BROTHERS, sole Manufacturers, 196, Blackfriars-road, and 117, Union-street, Borough; and of all respectable ironmongers, builders, &c.

MACINTOSH INDIA-RUBBER WAGON COVERS, at reduced prices. Stocks of different sizes are always ready, and can be inspected at our Warehouse, MOSES, SON, and DAVIS, 14 and 15, Aldgate High-street, and at the Factory, India-Rubber Steam Works, Bow-common.

DURABILITY of GUTTA PERCHA TUBING. Many inquiries having been made as to the Durability of Gutta Percha Tubing, the Gutta Percha Company have pleasure in giving publicity to the following letter:—FROM SIR RALPH MONCKTON, Bart., VENTNOR, ISLE of WIGHT. Second Testimonial.—"March 13th, 1856. In reply to your letter, received this morning, respecting the Gutta Percha Tubing for Pump Service, I can state with much satisfaction, it answers perfectly. Many Builders, and other persons, have lately examined it, and there is not the least apparent difference since the first laying down, now several years, and I am informed that it is to be adopted generally in the houses that are being erected here."

N.B. From this Testimonial it will be seen that the CORROSIVE WATER of the ISLE of WIGHT has no effect on Gutta Percha Tubing.

THE GETTA PERCHA COMPANY, PATENTEES, 18, WHARF-ROAD, CITY-ROAD, LONDON.

HANCOCK'S PATENT VULCANIZED INDIA-RUBBER TUBING, HOSE-PIPES, WASHERS, ENGINE-PACKING, both round and flat, and SOCKET-RINGS, for Hot-water-pipes. Vulcanized Rubber Door-springs, and Solid Round Rubber Cord of all sizes of any length. Billiard Cushions and Rubber Strips cut to any pattern for bagatelle tables.

Diving-dresses of superior make, and improved Vulcanized Rubber Supply-pipes for ditto.

Vulcanized Rubber, in sheets, from three to four feet wide, and of any thickness. Air-beds, Pillows, and Cushions inflating Portable Baths, Invalid Cushions, and Articles of this kind made to any pattern to order.

N.B. All communications and orders punctually attended to, addressed to the Manufactory, JAMES LYNE HANCOCK, Goswell-mews, Goswell-road, London.

GEO. & THOS. EARLE, CEMENT MANUFACTURERS, HULL — Light, Dark, and Portland Cements equal to any made. Manufacturers also, and Dealers in Plaster, Paris White, Mastic, Hair, Lime, Laths, Slates, and Slate Slabs, Fire-bricks, Grindstones, Cement Chimney-tops, ditto Vases, Ridging, &c. Paints, Stucco, &c. Marble Merchants and Importers of Pozzolano.

11 George-yard, Lombard-street, City.

ELMLEY CEMENT WORKS.—ROMAN and PORTLAND CEMENT of the first quality, manufactured on the above works. Also STOCK and KILN-BURNT BRICKS, hand moulded and machine made, for sulpment or otherwise.—Apply to G. BOOTH, Agent, as above.

KEENE'S and PARIAN CEMENTS and FRENCH PLASTER, for internal uses. These well-known hard Stuccoes dry quickly, and can be painted upon within a few days.—Made and sold by JOHN BAZLEY WHITE and BROTHERS, Millbank-street Westminster

ATKINSON'S CEMENT, so long known and esteemed in London for plastering purposes, is a quick-setting Cement, that requires no colouring.—Sold exclusively by JOHN BAZLEY WHITE and BROTHERS, Millbank-street, Westminster; and Seel-street, Liverpool.

ARTIFICIAL HYDRAULIC or PORTLAND CEMENT combines the valuable qualities of the natural Cements with the additional advantage that it greatly excels them in its cementitious properties; that it is not affected by frost, and does not vegetate in damp situations. Account of COMPARATIVE EXPERIMENTS on the strength of this and other Cements read at the Institute of Civil Engineers, to be obtained from the Makers, JOHN BAZLEY WHITE, and BROTHERS, Millbank-street, Westminster, who prepare one quality only of Portland Cement.

BATH, PORTLAND, and ROMAN CEMENTS.—The London and West of England Cement Company can offer to the Trade the best natural HYDRAULIC CEMENTS at reduced prices. The Company particularly recommend the best quality of their Bath Cement for all modelling cornices, decorations, &c. as having all the qualities requisite for an interior cement, and being quite unaffected by extremes of weather. The Company also supply BLUE LIAS LIME, lump and ground, which will carry more sand than any in the market.—Communications to be addressed to their Head Offices, 30, Old Broad-street, London; to Mr. MONUMENT, 4, Caroline-place, City-road; to Mr. TIMEWELL, the Depôt, 9, North Wharf-road, Paddington; or to the Works, Dunball, Bridgewater.

SOUTHAM BLUE LIAS LIME DEPOT.
Glazed Stoneware Sewage Pipes.
Brick, Lime, and Cement Merchants,
TATHAM and CO.
14, South Wharf, Paddington.

PARIAN CEMENT, reduced in price 25 per cent. This article is valuable for inside stucco, and especially for skirtings, for flooring on brick arches, &c. It takes paint in a few hours after its application on walls or laths, is without efflorescence, and may be papered in a couple of days. A finer quality forms a beautiful Scagliola, with any admixture of colours.—Manufactured by FRANCIS, BROTHERS, Cement Works, Nine-elms, London.

CEMENT.—ROMAN and PORTLAND CEMENTS, and PLASTER of PARIS, manufactured by C. J. HILTON, can be had in any quantity, wholesale and retail, at his wharf, 6, Upper Thames-street, London; and also at the manufactory, Faversham, Kent.—N.B. These Cements supplied for shipment, on advantageous terms.

JOHNS and CO.'s PATENT PERMANENT STUCCO WASH (perfectly non-absorbent), STUCCO, CEMENT, STUCCO PAINT.—CLARK and BENGOUGH, Manufacturers, Grand Surrey Canal Bridge, Old Kent-road. Office, 4, George-yard, Lombard-street.

PORTLAND CEMENT.—JAMES WESTON having enlarged that portion of his CEMENT WORKS on Millwall, Poplar, for Manufacturing the above CEMENT, begs to inform the Trade in general that they can be supplied with any quantity they may require at his Wharf, in the St. Andrew's Wharf, Earl-street, Blackfriars, or Middle Wharf, Scotland-yard, Westminster. Manufacturer of Roman, Lias, and Mastic Cements, English and French Plaster, &c.

PORTLAND and ROMAN CEMENT.
PLASTER of PARIS
Manufactured by J. M. BLASHFIELD, at Millwall, Isle of Dogs.
Warehouse, No. 1, Wharf, Paddington-basin.

THE PORTLAND CEMENT WORKS, NORTHFLEET, KENT.—Messrs. ROBINS and CO. to WHOM THE PRIZE MEDAL WAS AWARDED in 1851 are prepared to supply any quantity of the very best PORTLAND CEMENT, manufactured by them for all the purposes to which Cement is applicable. Orders received at Great Scotland-yard and at the Works.

PORTLAND CEMENT WORKS, NORTHFLEET, Kent.—KNIGHT, BEVAN, and STURGE, Manufacturers only of first class quality, for the home and foreign trade. Portland Cement manufactured at these works with especial reference to its destination, whether for stuccoing, brickwork, blocks for breakwaters, tidal work, or otherwise.—London Wharf, Belvedere-road, Lambeth.

PORTLAND and ROMAN CEMENTS.—T. H. BOORMAN, WILD, and CO. MEDWAY LIME and CEMENT WORKS, LOWER HALLING, near Rochester. Agent at the Works—Mr. THOMAS WILD.
Agents in London, Messrs. GEORGE POTTER and CO. Limemerchants, Purfleet-wharf, Earl-street, Blackfriars, and No. 19, North-wharf-road, Paddington.

PORTLAND and BATH CEMENTS.
TATHAM and CO.
14, South Wharf, Paddington.

PORTLAND and BATH CEMENT.—FULLWOOD THOMPSON and CO. request the attention of Merchants and Contractors to the quality of their Portland and Bath Cements, which they manufacture on an improved system, securing regularity of strength and colour, and at a less cost than is attainable by most other makers.
These cements set under water in a few minutes, and are not affected by extreme heat or cold.
FULLWOOD THOMPSON & CO. will be happy to send prices and samples in reply to application by post. They deliver free into the Bristol and Exeter Railway Company's trucks at their works, or free on board in the Port of Bridgewater.

BLUE LIAS LIME.—CHAS. NELSON begs to offer to consumers a supply of Blue Lias Lime direct from his Quarries in Warwickshire, the quality of which has been tested by several of the largest building firms in the metropolis and approved by them; and he also has reason to believe that their patronage during the last three years have always expressed themselves satisfied with his system of weighing or measuring the lime. When they wish to deliver by rail, the master has instructions to produce (on demand) the canal gauger's pass, by which the purchaser may know the exact weight delivered.—Orders addressed to the London Depôt, 16, South Wharf, Paddington, J. D. BLYTH, Sole Agent, will have immediate attention.—Quarries and Manufactories, Stockton, near Southam, Warwickshire.

HUBBUCK'S WHITE BODY PAINT of superior body to the Best White Lead, whilst it is as smooth and permanent as Zinc Paint. One coat laid on as directed is equal to two coats of White Lead; whilst consumption of material is less than for one coat. It dries very fast and hard.
HUBBUCK'S STONE COLOUR BODY PAINT the same as the former, at three fourths the price.
HUBBUCK'S PATENT WHITE ZINC PAINT is invaluable for Iron Ships and Iron exposed to salt water; neither bilge water, nor noxious vapours from cargo, nor heat on funnels of Steam Vessels act upon it. Sold by the Wholesale Paint Dealers, in oriental packages, stamped, HUBBUCK, LONDON, PATENT; and when so marked the quality is guaranteed
HUBBUCK'S COPPER COLOUR ENAMEL PAINT prepared expressly for the bottoms of Iron and Wood Steam Ships, a protection from rust and incrustation. Timber coated with this Enamel is not attacked by the worm neither do barnacles attach to it.
Full particulars of THOMAS HUBBUCK and SON, Paint and Varnish Works, opposite the London Docks, London.
OLD ZINC AND ZINC CUTTINGS BOUGHT TO ANY EXTENT.

CHARLES RICHARDSON, 3 & 6, SOUTH-WHARF, PADDINGTON BASIN.
GOWLEY AND KENT BRICKS,
PORTLAND, ROMAN, AND OTHER CEMENTS,
TAMWORTH GLAZED SEWAGE PIPES
BLUE VITRIFIED BRICKS, COPINGS, PIPES, &c.

3 & 6 South Wharf, Paddington.
NOTICE.
CHARLES RICHARDSON takes the earliest opportunity of informing Engineers, Architects, Contractors, and others, that he is now building GREAVES'S BLUE LIAS LIME per the Great Western Railway from Harbury to Bull's-bridge and Paddington, from whence it can be delivered alongside any part of the river Thames, canals, or railway stations in London the day after it is burnt and ground, in any quantity, and at a great reduction in price.
All applications for prices and terms will meet with prompt attention.
N.B. Please observe the lime is ground at the works, not in London.

GREY STONE LIME WHARFS, 12, UPPER GROUND-STREET, Blackfriars (Surrey side), 7, NORTH WHARF-ROAD, Paddington.
WILLIAM PETERS begs to inform the trade he is in a position to supply the best GREY STONE LIME in any quantities from the above wharfs, or per barge direct from the kilns.
Large Grey Stone, or Grey Chalk, free on board at Works, a 9d. per ton.
Small ditto, ditto, 4d. per ton.
Barges loaded in a few hours' notice.
Wouldham-hall Grey Stone Lime Works, on the Medway, near Rochester.

NOTICE.
SOUTHAM HYDRAULIC BLUE LIAS LIME.
WILLIAM OLDHAM begs to inform those parties requiring genuine Hydraulic Blue Lias Lime, that he is prepared to deliver the best quality of ground and lump, into boats, at the Works.—Address, WILLIAM OLDHAM, Blue Lias Lime and Cement Works, Southam.

BLUE LIAS LIME.—Messrs. GREAVES and KIRSHAW having completed their Works on the Birmingham and Oxford Line of the Great Western Railway, at Harbury, are now prepared to supply LUMP and GROUND LIME of the best quality, direct from the kilns, to all the Stations on the Great Western Railway.—Greaves's Blue Lias Lime.—Portland, Bath, and Lias Cement.—Works, at Harbury, Stockton, and Wilmcote.—Office, at Warwick.

PLASTER of PARIS manufactured, by T. P. BLATH, Baltwin's-place, Gray's-inn-lane, Holborn. The trade and suppers supplied on advantageous terms. Roman and Keen's Cement, Tiles, Plasterers' Hair, Pan and Plain Tiles, Fire Goods, &c

BRICKS of all kinds (clamp-burnt or kiln-burnt), Lime, Chalk, Chalk Rubbish for brick-making, Flints for building and pottery work, Foundry Loam, Whiting Whiting Sand for asphaltic, Land Drain Pipes, Patent Drain Pipes, Sand for bricklaying, &c. &c. sent by barge from Messrs. MEESON and CO.'S works at Grays, Essex, to any part of the Thames, the various canals, the river Lea, &c. or by rail to any station on the London and Southend and Eastern Counties lines, or any railway connected with them. Vessels of 500 to 600 tons can load alongside the wharves at Grays. At MEESON and CO.'S wharf and kilns, Bow-bridge, Stratford, Essex, the abovenamed articles can also be procured, as well as all kinds of fire goods (both Welsh and Newcastle). Fire-clay, Flare-burnt Lime, and Mortle and Cement Lime; and here lime is packed in bags, heads, casks, jars, &c. for exportation.
General Office—No. 12, GEORGE-YARD, LOMBARD-STREET
Letters addressed to Grays Essex, will meet with immediate attention.

BRICKS.—Malm Cutters, Yellow and Pale Seconds, Paviors, and Perkins's good and sound quality, constantly on sale at H. DODD'S Brickfields, which are only a quarter of an hour's walk from the City. H. D earnestly requests purchasers to favour him with a visit, in order to inspect his stock and to judge for themselves.
Malm Place, half-washed Stocks, and Place Bricks, also on sale. These bricks are sound, well burnt, and unusually free from defects; a very large proportion of the stock being suitable for external facing.
Apply to HENRY DODD and CO. at the Counting-house, HOXTON Brickfields, Grange-walk, near the Rosemary Branch, Hoxton.
N.B. Light-coloured Pit Sand of a proved quality constantly on sale upon reasonable terms. This Sand, from its not containing any saline matter, is acknowledged to be preferable to river Sand

BLUE BRICKS and TILES, of superior quality, and in great variety of mould, for ornamental work, paving, coping, and general purposes.—GEO. C. RYLAND, Limestone Wharf, Crescent, Birmingham.

FIRE-BRICKS, LUMPS, TILES, &c.—FURNACE-BUILDERS, GAS COMPANIES, and CONSUMERS of these Goods generally, can be SUPPLIED with every description from our Wharf here, on the most advantageous terms. TRAQUAIR and CO. 9, Bankside, Southwark.

THE PATENT BRICK MACHINE COMPANY invite orders for their IMPROVED MACHINES. One of them is working in a field at Caterham, near Croydon, and arrangements are made with the owner for bearers to refer to letter from the Secretary, to see it in operation every Thursday and Friday. It is the most simple machine invented. Trains from London-bridge to Wallington (close to the field), leave at 6 and 9.30 a.m. and 1 p.m.; return at 9.55 a.m. and 5.5 and 7.35 p.m.
HENRY C. MOUNT, Sec.
37, King William-street, City.

TO BRICK CARTERS, CONTRACTORS, and FARMERS.—TO BE SOLD, TWENTY-FIVE SETS of good, useful, second-hand CART HARNESS, viz. Thirteen Thill, and Twelve Trace.—Apply to W. E. WILLIAMS, Saddler and Harness-maker, High-street, Wandsworth, Surrey.

BEADON'S EAVES GUTTER TILES.—Mr. LAWES is prepared to CONTRACT for the ERECTION of the above TILES on roofs of all descriptions, in the neighbourhood of London, at 7d. per foot; above 10 feet, 6d.—Office, 1, Adelaide place, London bridge.

BEADON'S PATENT IMPERISHABLE GUTTER-TILES,
For Spouting Roofs of Houses (either old or new, whether of thatch, slate, or tile), and other structures.
PATENT.
J. B. LAWES, 1, Adelaide-place, London-bridge.
This is the cheapest kind of spouting known; for, besides its lower cost, it will last without paint or repair as long as the building itself. It will bear the weight of any ladder; and in case of accident a labourer can repair it. It occupies the room of a large height of roofing, effecting a great saving in slates, tiles, &c. It is especially applicable to the backs of houses in town, cottages, and agricultural buildings.
Price 4d. each tile of about 13 inches long; stop-ends and outlets, 6d. Any mason can put them up, or, if over 100 feet are required, a man will be sent to fix them at 6d. per foot. This charge to include tiles (delivered in Acre's yard), cement, and labour. May be had in London, Gloster, Bridgwater, and Rugby.

MAW and CO.'S ENCAUSTIC TILE PAVEMENTS, form a highly decorative and durable substitute for ordinary floorings, and their peculiarly oil cloth surfaces, for entrance halls, porches, conservatories, verandahs, passages, &c. &c. Priced pattern-book forwarded, post-free, and sketches of the various designs and colour combinations, supplied without charge, accompanied by estimates, on application to MAW and CO. Benthall Works, Broseley, Salop.

PEAKE'S TERRO-METALLIC TILES, PIPES, &c.—Notice is hereby most respectfully given, that the LONDON DEPOT for this WARE is REMOVED to No. 21, WHARF, Macclesfield-street North, City-road Basin. Secondly, that the trade term, "Terro-Metallic," as the exclusive right of the Proprietor; and, thirdly, that the "REPORTS OF THE JURIES," page 681, of the Great Exhibition, rank the Manufactories known so long as "The Tileries" Tunstall, Staffordshire, as the first of the kind in the world.

PANTILES, PAVINGS, &c. — J. H. ANDREWS, Wisbench, Cambridgeshire, begs to offer pantiles at 45s. 6d. per 1,000; floor bricks and 6-inch pavings, at 37s 6d. per 1,000; 8-inch pavings, at 57s. 6d. per 1,000; plain tiles, at 35s. per 1,000, delivered. Cash price.—Delivered on trucks in London or Eastern Counties Railway.

H. and R. HAYWOOD, Brownhills Blue Metallic Tileries, near Burslem, Staffordshire; London Depôt, 18, South Wharf, Paddington, Manufacturers of Improved Plain and Ornamental Roofing, Ridge, and Flooring Tiles, for Churches, &c.; also Metallic Plain and Socket Sewerage Pipes, &c. adapted for Sanitary and Railway purposes. They are extensively used on the London and North Western, Great Western, Trent Valley, North Staffordshire, and other Lines of Rail, and highly approved. Warranted unfreezable, and to resist all acids and escalations.
*** A FIRST-CLASS MEDAL was awarded to H. and R. HAYWOOD, by the Jury of the GREAT EXHIBITION.

WILLIAM GILBERT, Manufacturer of all kinds and colours of Tiles, Quarries, Drain-pipes, Moulded Bricks, Brackets, Vases, Chimney-pots, Stoneware Glazed Sewerage Pipes, Ornamental Queen Blocks, &c.
Tividale, Staffordshire.

ROYAL POLYTECHNIC.—Patron:—H. R. H. PRINCE ALBERT.
Now Open with the Society of Arts.
Evening Classes in Arithmetic, Algebra Geometry, Mensuration, Mechanics and Mechanism, History and Literature, Geography, Political Economy, Chemistry, French, and German, will open in September. The teachers of these classes will be paid out of the fees, and gentlemen desirous of conducting a class in one or more of the above subjects are requested to apply, by letter only, to Mr. BUCKMASTER, Polytechnic, 309, Wandsworth-road.
JOHN HENRY PEPPER, Sole Lessee and Manager.

TO BUILDERS AND OTHERS.
PATENT FOR SALE. — EABONE and ROBINSON, Engineers, &c. Clement-street, Birmingham, having patented an Invention for holding Nuts, &c. in all Public Buildings, which they find present considerable difficulty to carry out, the same not being altogether in their line of business, wish to dispose of their right. They take this opportunity of stating that this is a rare chance for any person that can introduce the article into churches and public places, it being so very useful and simple, can be made at almost a nominal cost, and sold cheap.
Apply as above.

WARNER'S PATENT VIBRATING STANDARD PUMPS.—PATENT CAST IRON PUMPS, for the use of farms, cottages, manure-tanks, and wells of a depth not exceeding 30 feet

Diameter of Barrel	Length of Barrel		£ s d

CHEAP, LIGHT, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT, has been extensively used and pronounced efficient, and particularly applicable for warm climates.

1st. It is a non-conductor of heat, and keeps buildings cool in summer and warm in winter.—2nd. It is light, the timber usually required being one-fifth. It can be easily applied by any unpractised person.—3rd. From its lightness, weighing only about 42lbs. to the square of 100 feet, the cost of carriage is small.—4th. Under slate, metal, or tiles, it is a most effective non-conductor.

INODOROUS FELT, for damp walls, floors, damp sheets under carpets and bed-ticks. PRICE ONE PENNY per square Foot.

CROGGON and CO.'S PATENT FELTED SHEATHING, for Covering Ships' Bottoms, &c., and

DRY HAIR FELT, for Covering Steam Boilers, Pipes, &c., prevents the radiation of Heat, saving 25 per cent. of Fuel, and deadening Sound.

Samples, testimonials, and full instructions, on application to CROGGON and CO. 2, DOWGATE-HILL, LONDON.

ANNUAL DIVISION OF PROFITS.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY,

14, Waterloo-place, London, and 19, Brown-street, Manchester.

Instituted 1849.

THE CHAIRMAN.

RICHARD HARTLEY KENNEDY, Esq. Alderman, Deputy-Chairman.

This Society is established on the tried and approved principle of Mutual Assurance. The funds are accumulated for the exclusive benefit of the Policy holders, under their own immediate superintendence and control. The profits are divided annually, and applied in reduction of the current premiums. Policy-holders participate in profits after payment of five annual premiums.

The Annual General Meeting was held on the 28th May, 1856, when a highly satisfactory Report of the state of the affairs and progress of the Institution was presented to the Members. During the last three years, upwards of 1,200 new assurances have been effected, yielding an Income of premiums of more than 30,000l. per annum; and although a general high rate of mortality has prevailed among Assured lives during the last two years, it has not been deemed necessary to resort, in any slightest degree, to the allowances previously awarded to the Policy-holders.

The Members present at the meeting were fully satisfied with the Report, and resolved unanimously that a Bonus of 4 per Cent. should be added to the current year's Premium payable by such Policy holders as had then participated in the Profits.

Credit is allowed for half the annual Premiums for the first five years.

A. R. IRVINE, Managing Director.

1, Waterloo-place, London.
Dated June, 1856.

A FIXED ALLOWANCE OF 6l. PER WEEK, In case of Injury by

ACCIDENT of any DESCRIPTION, or the sum of 1,000l. IN CASE OF DEATH,

may be secured by the payment of 3l. for a policy in the RAILWAY PASSENGERS' ASSURANCE COMPANY.

A weekly allowance of fifteen shillings for injury, or 100l. in case of death, may be secured for fifteen pence.

NO CHARGE FOR STAMP DUTY.

Forms of proposal, prospectuses, &c. may be had of the agents, of the clerks at all the principal railway stations, and at the head office, London, where also

RAILWAY ACCIDENTS ALONE

may be insured against by the journey or by the year as heretofore

Railway Passengers' Insurance Company, empowered by a Special Act of Parliament.

WILLIAM J. VIAN, Secretary.

Offices, 3, Old Broad-street, London.

CLERICAL, MEDICAL, and GENERAL LIFE ASSURANCE SOCIETY,

26, Great Russell-street, Bloomsbury, London.

NOTICE is hereby given, that the usual Dividend of Five per Cent. (free income-tax) on the paid-up Capital on the Shares of the Society, will be PAYABLE at the Office on and after WEDNESDAY, the 20th day of August instant.

GEORGE H. PINCKARD, Resident Secretary.

N.B. The SHAREHOLDERS' Annual Meeting will be held in January next. The last Report, giving a detailed statement of the affairs of the Society can be obtained free on application.

These pipes are made under steam pressure, and burnt to great hardness, and are capable of bearing nearly double the hydraulic pressure of ordinary glazed pipes. The prejudice against red-ware is overcome by this manufacture, and it is well known that good earthenware, UNGLAZED, is the oldest material discovered in a perfect state in Roue, Babylon, Nineveh, &c. &c.

STONE PIPES.—GLAZED STONEWARE PIPES of the most superior quality, at REDUCED PRICES.—E. and W. STURGE invite particular attention to their stock of these goods, which continue to give great satisfaction both as to manufacture and price, a list of which will be sent upon application. An increased discount will be allowed to large contractors. Every description of junctions, bends, &c. in stock. Yorkshire paving, sinks, sills, steps, and coping, &c.—E. and W. STURGE, Bridge-wharf, City-road.

GREAT REDUCTION in the PRICE of STONEWARE POTTERY from this date.

VICTORIA POTTERY, LEIGH, near SOUTHEND; London Establishment, Falcon Wharf, St Saviour's Dock.—DAVID ROUNTAGUE, Manufacturer of every article of Lambeth POTTERY, having now further reduced the prices, begs to offer to consumers and others, STONEWARE PIPES, &c. &c. on the most advantageous terms. The new lists of prices will be forwarded on application as above.—Feb. 11, 1854.

WATER-CLOSET, WITH APPARATUS COMPLETE, for 12s. 6d.

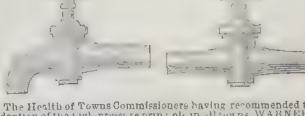
CONSISTING OF

STAFFORDSHIRE BASIN AND TRAP,

Enamelled White Inside,

BRASS VALVE, &c.

MANUFACTURED AND SOLD BY



W. PATTEN, PATENTEE,

OLD FISH-STREET, near SAINT PAUL'S,

LONDON.

PRIZE MEDAL, CLASS 2.

HIGH-PRESSURE VALVE COCKS.—LAMBERT'S PATENT.

These Cocks have, during the last five years, been extensively and most successfully used in many Towns under continuous high pressure, varying from 100 to 260 feet; their efficiency and durability is by experience established.

The Equilibrium Ball-valve is simple and certain in its action, and is cheaper than the common Cocks now in use.

Enamelled iron, self-acting, and other closets, upon economic arrangements, suitable for public buildings, cottages, asylums, &c.

THOMAS LAMBERT and SON,
Brass and Iron Founders, Short-street, New-cut, Lambeth.

TO WATER COMPANIES AND PLUMBERS.

HIGH-PRESSURE COCKS & CLOSETS.

The Health of Towns Commissioners having recommended the adoption of the high-pressure principle in all towns, WARNER'S HIGH-PRESSURE COCK is recommended as a Cock free from leakage, and applicable for all purposes and situations. Patent Closets and Basins with supply-valve for attaching direct to main pipes without a cistern, cocks, or wire.

LEAD, IRON, and TIN PIPE.

JOHN WARNER and SONS, Manufacturers, 8, Crescent, Jewin-street, London.

To be viewed on Friday and Saturday previous, and Catalogues at 1s. each may be had on the Premises; and of Messrs. FULLER and HORSEY, Billiter-street, City.

TO ENGINEERS AND OTHERS.

MESSRS. FULLER and HORSEY are instructed by the Proprietor (who is retiring) to SELL by AUCTION, on the PREMISES, Herbert-road Iron Works, Waterloo-road on TUESDAY, SEPTEMBER 9, and following day, at ELEVEN, in lots, without reserve, the MACHINERY, Tools, and Stock-in-Trade of a LATHE and TOOL MAKER (the tools principally by Smith Beacock, and Tannett, of Leeds), including fourteen self-acting lathes, from 20 inch and one 10-inch screw cutting, with beds 20 feet and 22 feet long, seven screw cutting, from 6 inches to 84 inches centre; four surfacing lathes, to take in surfaces from 4 feet to 7 feet in diameter; two horse-mills, thirty engine and hand-turning lathes, with slides; five self-acting planing-machines, the largest to take in 3 feet wide and 12 feet long; three self-acting shaping machines, three self-acting drilling-machines slotting machine, screwing machine, wheel-cutting machine, oscillating steam-engine of 14-horse power, Cornish steam boiler, 18 feet long, 6 feet 6 inch, 7,000 feet of turned bright iron, over head motions, riggers, straps, and driving gear; fifty vices, work-benches, hammermen's and blacks' steel tools, stocks, and dies, 12 ropes, smiths' fan, five tons of coal and coke, about ten tons of bar and rod iron, and numerous other effects.—To be viewed on Saturday and Monday previous to the sale, when catalogues may be had on the Premises; or of Messrs. FULLER and HORSEY, Billiter-street, City.

IMPORTANT WATER-SIDE PROPERTY, ON THE THAMES IN THE CITY OF LONDON.

MESSRS. FULLER and HORSEY are instructed by William Crawshay, Esq., to SELL by AUCTION, on WEDNESDAY, OCTOBER 1, and following day, at the MART (unless an acceptable offer is previously made by private contract), the spacious MERCANTILE PROPERTY, held under the Corporation of London, known as George yard, Upper Thames-street, in the city of London, having a frontage next the Thames of 193 feet, and occupying a superficial area of about 34,000 square feet, a site unrivalled in the metropolis, either as a depôt for landing and housing goods or for carrying on any wholesale business for which extensive water-side premises are desirable. George-yard is unexcelled for access to the London establishment of Mr. Crawshay, the eminent ironmaster, and has been in the occupation of his family and predecessors for more than a century. The trade carried on ranks among the first in the City, the returns are very large, and, to any firm wishing to carry on the premises for the same business, a large proportion of the connexion may doubtless be secured. In the year 1842 the occupier expended many thousands of pounds in the erection of a magnificen range of buildings, 160 feet in length by 65 feet in width, abutting on to the river; the structure is of the most substantial character, and, if needed for the purposes of warehousing goods, the foundation and walls are quite equal to support an elevation of several stories above those already erected. The building is one lofty ground floor, with gallery supported on iron girders and columns, and constructed to carry any weight. There is also a stack of warehouses, abutting on the river, 75 feet in length, of two floors, and a stack of warehouses, 60 feet in length, of three floors, abutting on Thames-street. A commodious dwelling-house in the yard, the lower part converted as offices for clerks and principals. A comfortable dwelling-house in Thames-street, and numerous paved yards, with two separate entrances, affording every convenience for loading and leaving goods. The whole is held a lease from the Corporation of London for a term of 99 years, at the low rent of £60, subject to the rent of 1,200l per annum. A stack of warehouses adjoining, of three floors, with frontage of 133 feet in Castle-yard, may be added if desired, at a ground-rent of £40 per annum. To be viewed till the sale. Printed particulars and plans will shortly be ready, and may be obtained at the Mart, of Messrs. Crowder and Mayhall, Solicitors, 67, Coleman-street; and of Messrs. Fuller and Horsey, Billiter-street, London.

VICTORIA-STREET, WESTMINSTER.—Important Sale of new Building Materials, Plant, Stock, and Utensils of a Builder.

MESSRS. FULLER and HORSEY are instructed to SELL by AUCTION, on TUESDAY, SEPTEMBER 16, and following day, at ELEVEN each day, on the PREMISES, lots 1 to 4 Victoria-road, Victoria-street, as well as the entire BUILDING MATERIALS, partly prepared, adapted for first-class buildings; including 3,000 feet 3-inch sashes glazed with plate-glass; 3,000 feet ditto, glazed with sheet-glass; 4,0 feet 3-inch, with ogee and astragal sashes; 2,000 feet ditto, not glazed, 6,400 feet 3-inch sashes, 4,000 feet 2 inch sashes and frames, 1,000 feet 2 inch Venetian sashes and frames, [illegible] and two-leaf frames, [illegible] squares [illegible] feet moulded architraves, 1,500 feet 6 by 3 deal fascia, 2,000 feet moulded skirting, 1,000 feet 9 by 3 deal paving, 5,000 feet self-faced ditto, 1,000 feet cube York stone, 1,700 feet [illegible] 5,000 stock and fire-bricks, 400 yards cast-iron rest [illegible] 12 lots of half-inch and three-quarter ditto, 200 marble chimney-pieces, 15 slate cisterns, 10 open baths, 10 gas stoves, 30 cast iron-pipe, 8 galvanized tanks, gas brackets and pendants, 10 cast iron [illegible], an assortment of [illegible] 2 patent [illegible] 2 [illegible] 12 [illegible] 10 to 40 feet; 1,000 feet run 3-inch plank, 500 dozen scaffold cords, 60 ladders, 30 benches, barrows, 8 brass-fusadore lathes, smiths' forges, vices, anvils, bellows, air furnace, moulding troughs, and tongs, 2 painters' machines, 24 pair steps, and trestles; an assortment of boxes; stocks and dies, steel tools, 50 dozen new files, 100 pair casement two-leaf fastens, and numerous other effects. To be viewed four days previous to the sale, when catalogues, at 6d. each may be had on the Premises; and of Messrs. FULLER and HORSEY, Billiter-street.

SALES BY AUCTION.

Ornamental Fountains and Vases, Garden pumps and Engines, Hydraulic Ram, Gas-fittings, and Effects

MESSRS. FULLER and HORSEY are instructed to SELL by AUCTION, on the PREMISES, on TUESDAY, FRIDAY, AUGUST 29, at ELEVEN precisely, the Stock-in-TRADE and TOOLS of an HYDRAULIC and GAS ENGINEER, including ornamental fountains and vases, garden-encingines, pumps and syringes, force-pumps, gas fittings in chandeliers pendants, and brackets, composition and iron pipe, elbows, bends, T's, &c.; brass-cocks and other fittings, numbers of taps, &c., twenty-one sluice-cocks, (3, 4, and 5 inch), two Parsay's pumps, water closets, bar and rod iron, several tons of cast iron 16 feet of old gun metal and brass, tools in lots; several double lathes, drilling machines, vices, benches, steel tools, portable forge, smiths' tools, driving-wheel, inchet braces, twenty dozen of files, a large assortment of wood screws, and other effects.—To be viewed on Thursday previous to the sale, when catalogues may be had on the premises, and of Messrs. FULLER and HORSEY, Billiter-street, City.

REDHILL, near REIGATE, SURREY.—Valuable Freehold Building Land, coming about Eight Acres.

MESSRS. NORTON, HOGGART, and PRIST are instructed by the Proprietor to OFFER for SALE, at the MART, on THURSDAY, AUGUST 28, at TWELVE, in one lot, a very valuable ENCLOSURE of FREEHOLD BUILDING LAND, containing nearly eight acres, situate adjoining the estates of Lord Monson, at Gatton, Mr. Wilkinson, Esq., on the road from Reigate to Bletchingly, in the parish of Nutfield, a delightful and fine healthy part of the county of Surrey, only ten minutes' walk from the Redhill Station of the London and South-Eastern Railways, and about three-quarters of an hour's ride from the metropolis. The property is on the rise of a hill, commands extensive views of the surrounding country, and forms a most important frontage of about [illegible] feet in depth, and is admirably adapted for the erection of a residence of a superior class, or for sale, when either a portion or the whole can be viewed, and particulars had at the Queen's Head Inn, Nutfield; at Laker's Hotel, Redhill; the White Hart, Reigate; of Messrs. Farebrother, Wynn, and Dart, Solicitors, 19 and 13, Clement's-lane; of E. G. Pennington, Esq. 91, Newman-street, Oxford-street; at the Mart; and of Messrs. Norton, Hoggart, and Trist, 62, Old Broad-street, Royal Exchange.

HIGHGATE HILL, AT THE JUNCTION OF MAIDEN-LANE.—Very valuable Freehold Estate, comprising a capital old-fashioned Family Residence, with Stabling, Gardens, and Paddocks, the whole comprising about six acres, full of sand and brick earth, and, from its position, one of the most important and valuable building sites in the vicinity of London.

MESSRS. FAREBROTHER, CLARK, and LAY are instructed to present for SALE, at GARRAWAY'S COFFEE-HOUSE, on WEDNESDAY, the 27th of AUGUST, at TWELVE o'clock, in one lot, a very valuable FREEHOLD ESTATE, situate on Highgate-hill, at its junction with Maiden-lane, and close to the town; comprising a capital old-fashioned family residence, containing dining and drawing rooms, numerous bed rooms and servants' offices, stabling, with [illegible], standing, and [illegible]. Adjoining the residence is a conservatory, opening to the lawn and pleasure-grounds, kitchen garden, and paddock, with pond of water, the whole containing about six acres. The estate from the property over London are most extensive, and from the great frontage, both to Highgate-hill and Maiden-lane, presents one of the most desirable building sites ever offered. The estate is full of brick earth and sand, and, being raised, the whole might be easily converted to bricks prior to building on the property. May be viewed by cards only, which, with particulars and plans, may be had of Messrs. Reg Solicitor, Great-am-street, City; at Garraway's; and at the Offices of Messrs. Farebrother, Clark, and Lay, Lane ster place, Strand.

REIGATE.—Important and Valuable Freehold Estate, approaching 70 acres. Free from Land Tax. A most attractive investment for a genuine or speculative enterprise, near to the Railway Station, at Redhill

MR. WILLIAM THORNTON is instructed to submit to PUBLIC COMPETITION, at the MART, on FRIDAY, AUGUST 29, the unsold and practicable portion of this very desirable PROPERTY, lying within a ring fence, and beautifully studded with park-like in appearance, and commanding extensive and picturesque views over the Vale of Holmsdale. Gatton-park woods forming a prominent feature in the foreground. In order to illustrate the importance of this fine estate, either for a public institution or a private residence, and most profitable investment for any building operations of enquiry, a model of the same is expended on the west by the estate of Lord Monson, and on the south by the estates of the executors of Norman Wilkinson, Esq. and H. J. Gurney, Esq. This will, with a view of the district in bird's-eye, be a perfect proverb. The railway, a few hundred yards off, offers a choice between 120 trains for communication with all parts of England, and the metropolis is reached in thirty-five minutes. Superior building stone underlies a considerable portion of the estate, and [illegible] and are also found. There is also a nice-formed house, with various agricultural buildings, garden, orchard, &c. In addition to the above, a [illegible] may be mentioned that it is the only freehold estate of the same extent in [illegible] to the railway in the market, and that the demand for land being greatly in excess of the supply, is daily rising in value and public estimation. Since the property was first offered for sale, 33 acres have been disposed of; it will now be first offered in its entirety, and if a satisfactory price be not obtained it will be submitted in three lots.—Full descriptive particulars will shortly be issued [illegible] to [illegible] and plans annexed; and may be obtained at the Jamaica Coffee-House, Redhill; Old Ship, Brighton; Calverly Hotel, Tunbridge-wells; Crown, Tunbridge; Grayshound Inns, Croydon and Sutton; White Hart, Mitcham; Bull and Anchor Inns, Greenwich; at the Offices of Mr. Morrison, Sen. or Mr. G. C. Morrison, Solicitor, Reigate; of Messrs. Dawson, Richards, and Clutterbuck, Solicitors, 3, Old Jewry; at the Mart; and of Mr. Wm Thornton, Land Agent, Surveyor, and Auctioneer, Reigate.

NOTICE. — To MAHOGANY MERCHANTS, CABINETMAKERS, and OTHERS. — The NEXT LIVERPOOL PERIODICAL SALES, by AUCTION, of ST. DOMINGO and CUBA MAHOGANY, HAVANNAH CEDAR, and other Furniture Woods, Baltic and American White Woods, at the Exchange Rooms, WEDNESDAY MORNING, the 3rd SEPTEMBER next, at ELEVEN o'clock, in the WOOD SALES SHEDS, Brunswick and Toxteth Dock, Liverpool.

EDWARD CUBITT, Wood Broker and Measurer, No. 6, East-side Queen's Dock, Liverpool.

BANKRUPTCY.

MR. ALFRED DAY has received instructions from the Assignee of Messrs. Rowland and [illegible], of [illegible] Mill, Arlington-street, New Windsor, Middlesex, Prehend-street and Arlington-street, New North-road, to SELL, on TUESDAY, the 26th day of AUGUST, 1856, at TWELVE, in three lots, the FIRST PORTION of the STOCK and UTENSILS in TRADE of a BUILDER, comprising an 8-horse power steam-engine, a 3-horse ditto, a 10-horse power boiler, circular saw-tables, up and down frame ditto, planing tables, grooving-machine, mortise ditto, moulding [illegible] ditto, [illegible] 2 feet of scantling, sheet and pipe lead, [illegible] scaffold boards, ditto pullocks, dozen of cord, 30 ladders, [illegible] colours of white-lead, turps, &c., colours, glass, paper, [illegible] [illegible] [illegible]

The Builder.

The Committee think there must be many other important local ties in which it would be desirable that the Exhibition should be represented, and would be glad to hear from those who are willing and able thus to assist.

JAS. FERGUSSON, F.R.A.S. } Hon. Secs.
JAS. EDMESTON, jun. }

ARCHITECTURAL EXHIBITION and COLLECTION of MATERIALS, PATENTS, and MANUFACTURES connected with Architecture.—All Drawings, Models, Photographs, &c. must be delivered at the Galleries, Suffolk-street, Pall-mall East, on the 1st and 2nd of DECEMBER next. The printed rules may be had on application to the Hon. Secretaries.

The Committee announce with much satisfaction that the Rev. Mr. Boutell, Mr. R. W. Billings, Mr. Owen Jones, Mr. George Scharf (unless circumstances in the mean time should interfere), and other gentlemen, have kindly promised Lectures for the Tuesday Evenings, as on the last occasion. Full particulars will be published as soon as arrangements are complete. Season tickets, admitting at all times to the Exhibition and to all the Lectures, will be half-a-crown, as before.

DEPARTMENT for MATERIALS.—Persons desirous to make their inventions known, will find this the best and indeed only way of bringing them under the notice of the whole body of Architects in London and the country; and the Committee request that applications for space (directed to Mr. JAMES EDMESTON, Jun. Hon. Sec. may be made at once, as full two-thirds of the two rooms devoted to this purpose has been already applied for, and many who delay will certainly be disappointed.

Intending subscribers should send their names to the Secretaries; and it is requested that unpaid subscriptions for last year may be forwarded at once, as the issue of the balance-sheet is delayed until these are received.

BUILDERS' BENEVOLENT INSTITUTION.—The NINTH ANNIVERSARY DINNER will be held at the LONDON TAVERN, on WEDNESDAY, 29th OCTOBER next, Mr. Alderman WILLIAM LAWRENCE, President, in the Chair.

Gentlemen desirous of promoting the interests of the Institution by becoming Stewards, will be pleased to forward their names to the Treasurer, Mr. GEORGE BIRD, 38, Edgware-road; or to the Secretary, at the Offices, 19, Southampton-street, Bloomsbury.

A. G. HARRIS, Secretary.

BUILDERS' BENEVOLENT INSTITUTION.—An ELECTION of PENSIONERS will take place 27th NOVEMBER next. Candidates may obtain forms of application (to be returned on or before 29th SEPTEMBER) at the Offices of the Institution, 19, Southampton-street, Bloomsbury.

Pensions: 24*l.* per annum for males, and 24*l.* for females.

August 28, 1856. A. G. HARRIS, Secretary.

COMPETITIONS.

TO SURVEYORS and OTHERS.—PREMIUMS for PLANS. The Trustees for Sale of a Freehold Estate of 50 acres, including the Revhall Spa and near the Crystal Palace, require PLANS for LAYING OUT the SAME for building purposes, showing the necessary roads, sewers, &c. the whole to be clearly defined and approximate in suitable lots, and laid down to a scale of two chains to an inch, from actual admeasurement. The following premiums are offered:—For the plan adjudged the best by the trustees, 100 guineas; for the second, 100 guineas; for the third, 50 guineas. The plans to which the above premiums shall be awarded, will be returned by and be the property of the trustees. Further particulars may be obtained of Mr. PEACOCK, Builder, near the Jolly Sailor Station, Norwood, close to the property. The trustees will meet on the 30th day of OCTOBER next, to examine the plans, which are to be previously forwarded, enclosed and sealed, to the Secretary's Office, Auction Mart, London, addressed to the Trustees of the White Horse, Norwood, Estate.

CITY of LICHFIELD.—The Corporation of Lichfield having determined to establish a MUSEUM and LIBRARY, under the Public Libraries Act, 1855, architects are invited by the committee to offer a plan and estimate, with specification, for a suitable building, and are requested to send them to the Town Clerk's Office, on or before the 23rd of SEPTEMBER. The first outlay will not exceed 1,000*l*. Further information as to the site, required accommodation in the first instance, and other particulars, may be had on application personally or by letter.

CHARLES SIMPSON, Town Clerk.

CONTRACTS.

BASINGSTOKE CEMETERY.—To BUILDERS, CONTRACTORS, and OTHERS.—The Burial Board for the town of Basingstoke are prepared to receive TENDERS for the FORMATION of ROADS and PATHS, and the ERECTION of CHAPELS, LODGE, ENTRANCE-GATES, BOUNDARY FENCES, &c. on the site of the proposed Cemetery at Basingstoke. The plans, drawings conditions, and specifications can be seen, and information and bills of quantities obtained at the Offices of the Architects, Messrs. POULTON and WOODMAN, 1, Grey Friars-road, Reading, between the hours of TEN a.m. and FIVE p.m. from WEDNESDAY, SEPTEMBER 3rd, to MONDAY, SEPTEMBER 8th. The estimates to be prepared separately, as follows:—No. 1. Formation of Roads and Paths; 2. Erection of Chapels, Lodge, and Entrance; 3. Boundary Fences. Each contract may tender for one or more of these divisions of the work. All Tenders are to be sealed up, endorsed, and sent in to the Clerk to the Board, on or before TUESDAY, SEPTEMBER 9th, at TWELVE o'clock at noon. The Board do not bind themselves to accept the lowest or any of the Tenders.—By order, J. C. SHEBBEARE, Clerk to the Board.

Basingstoke, August 19, 1856.

TORQUAY WATER-WORKS.—The Local Board of Health are desirous to receive TENDERS for LAYING about EIGHT MILES of TEN INCH PIPE, SIX MILES of NINE-INCH, and ONE MILE of SEVEN-INCH; and for MAKING RESERVOIRS and other WORKS. Specifications and plans are to be settled for inspection at the Town-Hall, Torquay, Devon; and at the Office of the Engineers, Messrs. EASTON and AMOS, Grove, Southwark, London, on and after the 22nd instant. Sealed Tenders, addressed to the undersigned, to be delivered at the Town-Hall, Torquay, on or before TWELVE o'clock on TUESDAY, the 9th day of SEPTEMBER next. The Local Board do not bind themselves to accept the lowest or any Tender.

GEORGE E. HEARDER, Clerk to the Local Board.

Torquay, Devon, August 18, 1856.

TO BUILDERS.—CHELTENHAM COLLEGE.—The Board of Directors of the Cheltenham College, are willing to receive TENDERS for the ERECTION of a CHAPEL, in connection with the Institution. The drawings and specification may be seen and other particulars obtained at the Office of Mr. DANIEL JAMES HUMPHRIS, Architect, Cheltenham. The Tenders, which are to be sealed up, endorsed "Tender for New Chapel, Cheltenham College," must be delivered to Mr. W. L. BAIN, the Secretary, on or before the 1st day of SEPTEMBER next. The Directors do not pledge themselves to accept the lowest Tender.

D. J. HUMPHRIS, Architect.

London road, Cheltenham.

TO BUILDERS, CARPENTERS, and OTHERS.—Persons desirous of TENDERING for the CONSTRUCTION of about 1500 FEET superficial of DUNDARY FENCING, on the estate of the Catholic Orphanage, at Norwood, Surrey, may see the specifications at the Offices of Mr. WARDELL, Architect, 11, Parliament-street, on and after MONDAY, the 1st of SEPTEMBER, between the hours of TEN and FOUR o'clock. Tenders to be delivered to Mr. WARDELL, on MONDAY, the 8th of SEPTEMBER, at TWO o'clock. The lowest Tender will not necessarily be accepted.

CONTRACTS.

NOTICE to BUILDERS and CONTRACTORS.—ORDNANCE WORKS.—The Commanding Royal Engineer of the Dover district hereby gives Notice, that sealed TENDERS will be received at the Office of the Director-General of Contracts, Pall-Mall, London, on or before WEDNESDAY, the 10th day of SEPTEMBER, 1856, from persons desirous of CONTRACTING for TAKING DOWN and REBUILDING portions of the SCARP WALLS of the CITADEL, Dover. A specification of the works to be executed, may be seen by persons fully competent to undertake the work (none others need apply), and forms of Tender obtained at the Royal Engineer Office, Dover, between the hours TEN and FOUR o'clock, from MONDAY, the 1st of SEPTEMBER, to TUESDAY, the 9th of SEPTEMBER, 1856 (Sunday excepted). The party whose Tender may be accepted for the work, will be required to enter into a bond, with two eligible securities, jointly and separately, to be bound under a penalty of 500*l*. for the due performance of the Contract. Tenders for the above work to be addressed to the Director-General of Contracts, Pall-Mall, London, and endorsed "Tender for Repairing Scarp Walls, Citadel, Dover."

N.B. The War Department reserves to themselves the right of rejecting the whole or any of the Tenders.

Royal Engineer Office, Dover, August 23, 1856.

TO BUILDERS.—Notice is hereby given, that TENDERS will be received by the War Department, at their Office, Pall-Mall, London, on MONDAY, the 8th day of SEPTEMBER, 1856, from such persons as may be willing to undertake the ERECTION of a BOMB-PROOF MAGAZINE, to contain 10,368 Barrels of Gunpowder, at Tipner, near Portsmouth, in the county of Hants. The plans, specification, and conditions of Contract, may be seen, and every information obtained on application at this Office, on or after the 18th day of AUGUST, 1856, between the hours of TEN and FOUR each day (Sundays excepted). Tenders to be endorsed, "Tender for the Erection of a Bomb-Proof Magazine, at Tipner, near Portsmouth, in the county of Hants."

N.B. The War Department reserves to itself the right of rejecting the whole or any of the Tenders.

Royal Engineer Office, Portsmouth, August 7, 1856.

Royal Engineer Office, Portsmouth, 14th August, 1856.

TO BUILDERS.—Notice is hereby given that TENDERS will be received at the Office of the Director-General of Contracts, War Department, Pall-mall, London, on or before the 16th SEPTEMBER, 1856, from such persons as may be desirous of undertaking the Work Department for CONSTRUCTING and ERECTING FOUR POWDER MAGAZINES (each containing one barrel), and EIGHT SHOOTING SHEDS, together with Drain and Wall, Railing, Gates, and Earth traverse, at Marchwood, in the county of Hants. Plans and specifications, with forms of Tender, may be seen, and all other information obtained, on application at the Office, any day (Sundays excepted), between the hours of TEN and FOUR, from the 20th AUGUST, 1856, to 13th SEPTEMBER, 1856. The whole of the work to be completed within eight calendar months from the date of notification of acceptance of Tender. No notice will be taken of any Tender unless it be on the prescribed form. The War Department reserve to themselves the right of rejecting the whole or any of the Tenders.

NOTICE to CONTRACTORS and BUILDERS.—TENDERS will be received by the Director-General of Contracts, War Department, Pall-mall, London, on or before the 6th OCTOBER next, from such persons as may be willing to enter into a CONTRACT for the CONSTRUCTION of a FORT, near the village of Eson, in the county of Hants. Plans and specifications may be seen, and every information obtained on application at the Royal Engineer Office, Gosport, between the hours of TEN and FOUR daily, from the 25th SEPTEMBER to 4th OCTOBER, 1856. No notice will be taken of any Tender unless upon the printed form. The War Department reserve to themselves the right of rejecting the whole or any of the Tenders.

Royal Engineer Office, Portsmouth, August 20, 1856.

BOARD of WORKS for the LIMEHOUSE DISTRICT.—To BUILDERS, CONTRACTORS, and OTHERS. The Board of Works for the Limehouse District give Notice, that they will be ready on the 2nd day of SEPTEMBER, 1856, to receive sealed TENDERS from parties who may be willing to contract for the TAKING DOWN, CONSTRUCTING, and COMPLETELY FINISHING certain intended BRICK and PIPE SEWERS, 1,150 feet in length, or thereabouts, with other works in connection therewith, in Gill-lane, Jamaica-place, and Rich-street, in the parish of Limehouse; and in William-street and Henry-street, in the hamlet of Ratcliff; and for the maintenance of such works in complete repair for twelve calendar months. Plans, sections, and specifications for the above works, together with a form of Tender, may be inspected, and other particulars obtained, at the Office of the Board, White Horse-street, Commercial-road East, between the hours of TEN a.m. and FOUR p.m. until the 2nd SEPTEMBER next. Tenders addressed to the Limehouse Board of Works, must be delivered at the said Office by FOUR o'clock p.m. on the said 2nd of SEPTEMBER, and no Tender will be received after that hour. The Board do not bind themselves to accept the lowest or any Tender, and the party whose Tender shall be accepted will be required to provide two sureties for the due performance of the works. The attendance of parties tendering will be required at the meeting of the Board on WEDNESDAY, the 3rd day of SEPTEMBER next, at the Board-room of the Ratcliff Workhouse, York street West, Commercial-road East, at THREE o'clock p.m.

THOS. W. RATCLIFF, Clerk of the Board.

White Horse-street, Commercial-road East, 20th August, 1856.

TO BUILDERS.—Persons desirous of TENDERING for the CONSTRUCTION of a WHARF VIADUCT and GOODS SHEDS, and the ERECTION of WEIGHING MACHINES, and the performing of other works, on a Wharf, at Gainsborough, may receive information relative thereto, by applying to Mr. HANCOCK, Civil Engineer, 30, Great George-st. S.

[For remainder of Contracts see next page.

CONTRACTS.

BENJAMIN FOWLER & CO. GENERAL ENGINEERS, WHITEFRIARS-STREET, FLEET-ST.

ZINC ROOFING, INCLUDING TIMBER OR IRON FRAMEWORK,
IS AS
CHEAP AS SLATES OR GALVANIZED IRON, LIGHTER, AND MORE DURABLE.
Certificates, and Models of various descriptions, may be seen, and estimates obtained on application to
THE SURVEYOR OF THE VIEILLE MONTAGNE ZINC MINING COMPANY, 12, MANCHESTER BUILDINGS, WESTMINSTER.
ROOFS CONSTRUCTED UNDER HIS SUPERINTENDENCE GUARANTEED TO REQUIRE NO REPAIR FOR AT LEAST TEN YEARS.
THE OLD METAL BEING ALWAYS RETAKEN AT HALF-PRICE, RENDERS IT ADVANTAGEOUS FOR ALL TEMPORARY BUILDINGS.
Many roofs covered with zinc thirty-five years ago have never required repairs.

NEW PATENT INVENTIONS FOR STABLE REQUISITES.
AWARDED A PRIZE AT THE PARIS EXHIBITION, AND PATRONISED BY THE ENGLISH AND FRENCH GOVERNMENTS.

COTTAM and HALLEN, of Winsley-street,

Are the original inventors of the PATENT ENAMELLED MANGER, WATER TROUGH, and WROUGHT IRON RACK, which are now being introduced all over the country as the best and cheapest up to date. The great Rotundity of the wall of which is taken to the back of the manger, and works with ease and freedom up or down the gutter. Cottam's new Patent Seed Box, of galvanized iron, is an important addition to the above, being both simple in construction, light and durable, proven by oil and wear, and is recommended in its results. Also, the Patent Soft and Hard Metal Bracket contained, which can be used with great advantage where space is an object, as it is the turning up out of the way when not in use.

Improved Harness Holders, for preserving the shape of the harness, and preventing its cracking. Patent Loose Box Fittings Cheap and Durable of every Style.

Improved Surface Drain, with safety cover to Sanitary Trap, and every article for the harness-room and stable, kept in stock, plain, galvanized, and japanned. Estimates, Drawings, Models, &c.

The new Illustrated Catalogue for 1856 and Testimonials sent on application to

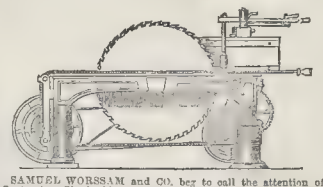
IRON FOUNDRY, Harrow-street, Lant-street, Southwark—W. R. BARTLETT, manufacturer of Girders, Columns, Cantilevers, Railing, and Newel Bars, Iron Coping, Panels, Tomb Enclosures, Area Gratings, Sash Weights, &c. Also Fly and other Wheels, Riggers, Pinions, Engine and Lathe Castings; Forge Backs, Furnace Bars, Kilns, Pans, Pipes, Tank Plates, and other Castings, to patterns or drawings.

JOHN TANN'S NEW PATENT RELIANCE LOCK and CHEMICAL FILLED WROUGHT-IRON FIRE-PROOF SAFES, DOORS, ROOMS, &c. Manufacturers of cash, deed, and paper boxes, embossing and copying presses, letter balances, and every description of iron locks and street-door latches. To be had at the General Lock and Safe Warehouse, 30, Walbrook, City. List of prices on application.

A PRIZE MEDAL for SUPERIOR LOCKS was awarded to J. H. BOOBBYER at the Great Exhibition of 1851, who invites the attention of Builders, &c. to his Stock of Ironmongery, Brass Foundry, Nails (wrought and cut), Copper and Zinc; Patent Locks of all descriptions; China, Glass, and Wood Furnitures of all kinds, with Patent Shifting Spindles; Dr. Arnott's Ventilator, 4s.; and the new registered Venetian Ventilator, so much admired, &c. 6s. 6d. each.
J. H. BOOBBYER (late STURCH and BOOBBYER), established nearly 100 years, for the supply of Goods from the best Manufactories, at the lowest prices.
14, Stanhope-street, Clare-market, London.



CHUBB'S LOCKS, with all the recent improvements; STRONG FIRE-PROOF SAFES, CASH and DEED BOXES.—Complete lists of sizes and prices may be had on application
CHUBB and SON, 57, St. Paul's-churchyard, London; 28, Lord-street, Liverpool; 16, Market-street, Manchester; and Horsley-fields, Wolverhampton.

GARDNER'S PATENT STEAM GENERATOR and SMOKE CONSUMER produces more steam with lessened consumption of fuel, and entire removal of smoke. These patented improvements are highly recommended for their simplicity, durability, and great economy. They are self-acting, have no moving parts, therefore require no external aid.

They are applicable to all Furnaces, Locomotives, Marine Engines, Ovens, Pottery and other Kilns, Common Fire, Kitchen Ranges, Hall and Hot-air Stoves.—Application to be made to the PATENTEE, 34, Norfolk-street, Middlesex Hospital; to Messrs. BURRIDGE and HEALY, 31B, Forset-street, Fleet-street; or to Z. D. BERRY, Albion Works, Wilton-road, Pimlico.
Testimonials, &c. may be seen upon application.

MACHINERY for SAWING, PLANING, MOULDING, &c.

SAMUEL WORSSAM and CO. beg to call the attention of Contractors, Shipbuilders, proprietors of Saw-Mills, and others, to their improved Inventions and Adaptations in Saw Frames and Benches, Roller and Chain Planing Machines, Endless Saw Frames, and all other kinds of Machines, for Sawing, Planing Grooving, and Moulding Wood. They have constantly on hand machinery, either wholly or partly made, so that they can at all times on short notice supply them. S. W. and CO. beg to state that they have hitherto confined their attentions to this sort of machinery, and have had the honour of supplying some of the most distinguished companies, ship builders, and contractors in the world with their machines, for home and foreign use. One of their Saw Benches, and also a smaller one, with Boring Apparatus, may be seen at the Machinery Department, Crystal Palace.—A descriptive Catalogue, with Drawings, may be had on application,
KING'S-ROAD, CHELSEA.

WOOD-CUTTING MACHINERY,
JOHN M'DOWALL and SONS,
WALKINSHAW FOUNDRY, JOHNSTONE, near Glasgow,
MANUFACTURERS of VERTICAL SAW-FRAMES
(driven by steam),
For cutting balks of timber, from 3 feet on the side down to the smallest deal frame.
Patent vertical saw-frames, of the foregoing dimensions, with steam-power attachet, circular cross-cut radial sawing machines; patent moveable ditto; patent horizontal cross-cut sawing machines, for heavy timber; planing machines, for working boards from 1/2 of an inch thick to 6-inch deck plank; revolving planers, for squaring and shaping heavy timbers, as used by ship-builders, &c.; patent curvilinear sawing machines, for circles, sweeps and straight cutting, well adapted for ship builders; power mortising and tenoning machines; moulding machines, single and double; veneer mills of all sizes, with all appendages; scale-board machines; for hat-boxes, &c.; patent silent feed motions for saw-frames; and every description of machinery for cutting and shaping timber, all constructed of iron, of the best materials, and first-class workmanship. Mr. M'Dowall has been in the engineering and millwright business for upwards of 30 years, but during the last 24 years he has directed his attention particularly to the manufacture of wood-cutting machinery, as evidenced by the numerous patents he has obtained for its improvement, and by the extensive orders his firm has been favoured with from the British and other European Governments and private establishments in almost all parts of the world; and from their large and commodious premises, and first-class plant made for every department of the work without resard to cost, the largest contracts can be executed with a regularity, accuracy, and despatch, which cannot be exceeded by any other firm in Europe.—Applications as above for further particulars, will be promptly attended to.

REGISTER STOVES, with PATENTED IMPROVEMENTS.—DEANE, DRAY, and CO. invite the attention of purchasers to their Stock of STOVES for drawing and dining rooms; also, a large assortment of PATTERNS, suitable for sitting-rooms, offices, bed-rooms, &c. In Feuders and Fire Irons, DEANE, DRAY, and CO are constantly introducing every novelty at the lowest prices.—DEANE, DRAY, and CO. Stove, Range, and General Ironmongery Warehouse, London-bridge. Established, A.D. 1700.

FIRE-PROOF CONSTRUCTION.—
FOX and BARRETT'S PATENT.
This improved system of fire-proof construction has been most extensively adopted, and its application has been extended to nearly EVERY DESCRIPTION OF BUILDING, whether public or private.
The system combines ECONOMY, with great simplicity of construction, perfect security from fire, increased durability, and many other important advantages.
The floors and roofs are formed by a combination of joists of wrought or rolled iron with concrete; so constructed that each floor becomes in effect a beam of artificial stone, with ribs of iron; the structure possessing great strength and rigidity, and forming a fire-proof foundation adapted to receive a finished surface, either of the ordinary flooring-boards, or of cement, asphalte, tiles, slate, or other material.
Some of the largest and most important buildings in the kingdom are now in course of erection upon this principle, which is recommended to the notice of all who are interested in building, both as superseding the necessity for cast-iron girders and brick arches, and as being the great desideratum of fire-proof construction, even for ordinary dwelling-houses and domestic buildings, within the reach of every one.
Further information may be obtained of the Proprietor of the patent,—Mr. BARRETT, 12, York-buildings, Adelphi.

CAST-IRON PIPES, IRON-WORK FOR OVENS, &c.
RAIN PIPES, &c.—F. A. TIDDEMAN and CO. 81, St. Ann's Wharf, Earl-street, City, near Blackfriars-bridge, keep a large stock of Rain Pipes, Heads, Shoes, Elbows, &c. half-round and O-G Gutters, Socket Pipes for Water or Gas, Flange Pipes, Hot Water Pipes and Connections, Sash Weights, and other castings; Iron-work for Bakers' Ovens of every description, fitted complete, to be had in sets or in parts.—Prices equal to all competition. Contracts taken to any extent. Goods landed. A powerful crane.

TO BUILDERS, CONTRACTORS, and OTHERS.—WANTED, a light, well-made TRAVELLING JENNY or CRAB, from 20 feet to 33 feet between the bearings, and capable of lifting five tons in the centre.—Apply to CUTLER and SONS, Iron Founders and Engineers, 18, Great Queen-street, Lincoln's-inn fields.

WANTED, a second-hand WHARF CRANE, capable of lifting five tons.—Apply by letter, stating price required, to Mr. F. TURNER, 15, Parliament-street, Westminster.

IRON TANKS.—WANTED, a new or second-hand cast or wrought-iron TANK, about 14 feet square, to hold say 3,000 gallons.—Address, stating price and full particulars, to SANDERS and WOOLCOTT, 54, Doughty-street, Gray's-inn-road.

IMPERISHABLE WROUGHT-IRON WATER-TANKS for household use (also suitable for oils or spirits) are the cheapest, most durable, and wholesome. They can be made in flat plates for the country or for exportation, and screwed together at their destined position. Steam and Hot Water Works, Baths, Ranges, Jacks, &c.
HENRY FROST, Engineer, 17, Rathbone-place, London.
N.B. Several double-action Lifts, a 3-horse Table-engine, and a strong Fly Press for sale.

NAILS and IRONMONGERY
From BIRMINGHAM direct.
Builders, Contractors, and Others, supplied with Nails, Iron, and Ironmongery of every description, at the
LOWEST BIRMINGHAM PRICES.
A complete LIST of which will be forwarded upon application to BLYTH and BRANCH,
Nail Manufacturers and General Factors, BIRMINGHAM; or at 19, Gresham-street, LONDON.

TO ARCHITECTS, &c.—The IMPROVED SELF-ACTING WATER-BAR for FRENCH CASEMENTS, the best and most effectual yet invented, is made by T. SMITH, of 14, Queen-street, Oxford-street, near Argyll-street, where a working model can be seen or will be sent for inspection on the shortest notice.
N.B.—Espagniolette Bolts of a superior quality, at reduced prices.

WROUGHT IRON GIRDERS, Steam Boilers, Gas Holders and Gas Apparatus, General Castings, Chains, Cables, and Contractors' Iron Work, Manufactured by MELROSE and RUSSEY, Phœnix Works, Tividale, near Dudley.—London Office, 78, Hatton-garden.

TO ARCHITECTS, BUILDERS, CONTRACTORS, AND OTHER CONSUMERS OF GLASS.

HARTLEY'S PATENT ROUGH PLATE GLASS,

1-8th of an inch thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th or 4 lbs. is now universally used for

RIDGE AND FURROW ROOFS, GREENHOUSES, RAILWAY STATIONS, MILLS, MARKET HALLS, BATHS AND WASH-HOUSES, FACTORIES, WORKSHOPS, SHIP-BUILDING SHEDS, AND OTHER EXTENSIVE BUILDINGS.

By a carefully prepared Estimate, it has been ascertained that FOUR-FIFTHS of the ROUGH PLATE, or non-transparent Glass, consumed in the United Kingdom in 1854, was manufactured by HARTLEY'S PATENT—thus affording the most incontestable evidence of its superiority over every other article of the kind, and as being the only description of Glass suitable for the purposes above named. It combines size and strength with economy of cost, and is manufactured in sizes expressly for RIDGE and FURROW ROOFS, giving a SPAN of TWELVE FEET, at a price not exceeding, weight for weight, that of Common Crown Glass. Its non-transparency renders BLINDS UNNECESSARY, and no scorching occurs in Greenhouses glazed with it; hence the preference given to this Glass for all Horticultural purposes.

For further particulars, apply to

JAMES HARTLEY AND CO. SUNDERLAND; AND PURFLEET WHARF, EARL-STREET, BLACKFRIARS, LONDON.

Sole Manufacturers of Lockhead's Patent Perforated Glass for Ventilation.

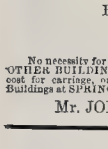
*** *Hartley and Co.'s Glass Tariff Newspaper will be forwarded gratis, on application.*

FACING FOR BUILDINGS COMPANY—TAYLOR'S PATENT.

BUILDINGS PERFECTLY RESISTANT TO WET WITHOUT ADDITIONAL EXPENSE, OR THE USE OF COMPO,

REQUIRING THE CONSTANT EXPENSE OF PAINTING. EXTERNAL WALLS FACED WITH AN INDESTRUCTIBLE MATERIAL.

STONE-FACED BUILDINGS AT LITTLE MORE COST THAN CEMENT.



No necessity for Iron Cramps and Bond-stones, and the Stone Ashlar never injuriously weighted by the settlement of the Mortar-joints of the inside Brickwork. The INSIDE of CHURCHES and OTHER BUILDINGS FACED WITH STONE instead of Plastering. Also Dining halls, Lobbies, Staircases, &c. of Private Residences. It can be had ready for fixing from the quarries at a small cost for carriage, or prepared at home. Can be used with the ordinary Bricks of any locality, and by the ordinary workman. The CHURCH faced inside and outside in this manner, and the other Buildings at SPRING GROVE HOUNSLOW, and elsewhere, can be inspected, and all particulars obtained, of

Mr. JOHN TAYLOR, ARCHITECT, OFFICES OF THE COMPANY, 40, KING-STREET, CORNER OF CHEAPSIDE.

THE SEVRES GLASS COMPANY.

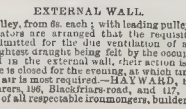
WINDOW DEPARTMENT.

PATENTEES FOR "IMPROVEMENTS IN THE MANUFACTURE OF QUARRIES AND OTHER PANES OF GLASS FOR WINDOWS, WITH FLOWERED AND OTHER PATTERNS, FROM EXAMPLES FOUND IN CHURCHES AND OTHER ANCIENT BUILDINGS."

Quarries of usual size, stain burnt in, 3s. per dozen.
Ditto, 3 in. by 4 size, glazed in strong lead, and measured from point to sill, with white outline, 4s. 6d. per foot square; with black and white fringe or bead outline, 5s. per foot square.
Quarries, small, taking more to the foot, from 9d. to 1s. 6d. per foot square additional.
Inner lines, beads, and fringes, of plain and coloured glass, from 4d. to 1s. extra per foot run
Scroll, leaf and block borders, enriched with colour, extra per foot run, 1s., 1s. 6d. and upwards.
Tracery Work, Trefoils, Quatrefoils, &c. measured square and charged according to pattern, from 6s. to 12s. per foot.
Geometrical Patterns, ordinarily 7s. 6d. to 10s. 6d. per foot; in very small lights, of best work, 12s. per foot.
Quarry Glazing of Patent Rolled Tinted Glass, plain, of mixed quarries, and other sorts, from 2s. to 3s. 4d. &c. per foot square.

PAINTED GLASS.



Quarry and Geometrical Work, from 6s. to 15s. per foot square.
Figures, Medallions, and first-class designs, from 30s. to 30l. per foot square.
Old Windows restored, as in Merton College, Chapel, Oxford.
N.B. Glass for Painters, specially prepared after the receipt of the Ancients, as obtained by analysis. Thus manufacture, combining purity of colour with solidity of material, so long desired, is the product of much antiquarian research and accurate knowledge of chemistry, on the part of two gentlemen, whose labours have been unremitting for the improvement of the art. It is now extensively used by the principal artists of the day, and has been highly commended.

DIRECTIONS FOR TAKING THE MEASURES REQUIRED.

Take the full height of lights from point to sill.
Cut out in pasteboard the exact shape of head to springing, which gives the width of light. Give a sketch of groove or rabbet, to show where the glass fits, and state if the measures given include, or not, the depth of rabbet or groove.
All forms of tracery should also be given in thin deal or pasteboard. This may be accurately done by bending a piece of stiff glazing lead to the shape of openings, and laying the same on the board as a guide for cutting out; the mould thus obtained may then be fitted to insure correctness.
Specimens of glazing, and orders in hand, may be seen daily on the Premises. The Manufactory may be inspected weekly, from Monday to Thursday, both inclusive; and printed lists obtained of the numerous places, both at home and abroad, to which during the last ten years so large a number of windows have been despatched from the Whitefriars Glass Works.
*** Messrs. POWELL having found their old buildings to be most inconvenient, and quite unfitted for the conduct of their business in its several departments, have just rebuilt a considerable portion of the premises adjoining the Manufactory. Messrs. Powell have added a Gallery and Show-room for the exhibition of windows and specimens of glazing. They have provided workshops in immediate connection therewith, and they anticipate generally, from the alterations effected, increased facilities in the despatch of business, and the consequent avoidance of disappointment arising from delay in the execution of orders.
August, 1856.

VENTILATION.—PURE AIR.

Sheringham's Ventilator for the admission of pure air through an

EXTERNAL WALL.

With single pulley, from 6s. each; with leading pulley, from 6s. 6d.
These Ventilators are arranged that the requisite quantity of air may be admitted for the due ventilation of an apartment without the slightest draught being felt by the occupants; and as they are placed in the external wall, their action is not impeded when the house is closed for the evening, at which time a constant supply of fresh air is most required.—HAYWARD, BROTHERS, sole Manufacturers, 196, Blackfriars-road, and 117, Union-street, Borough; and of all respectable ironmongers, builders, &c.

For form of application and prospectus, gratis, on receipt of stamped envelope.

The Builder.

Vol. XIV.—No. 708.

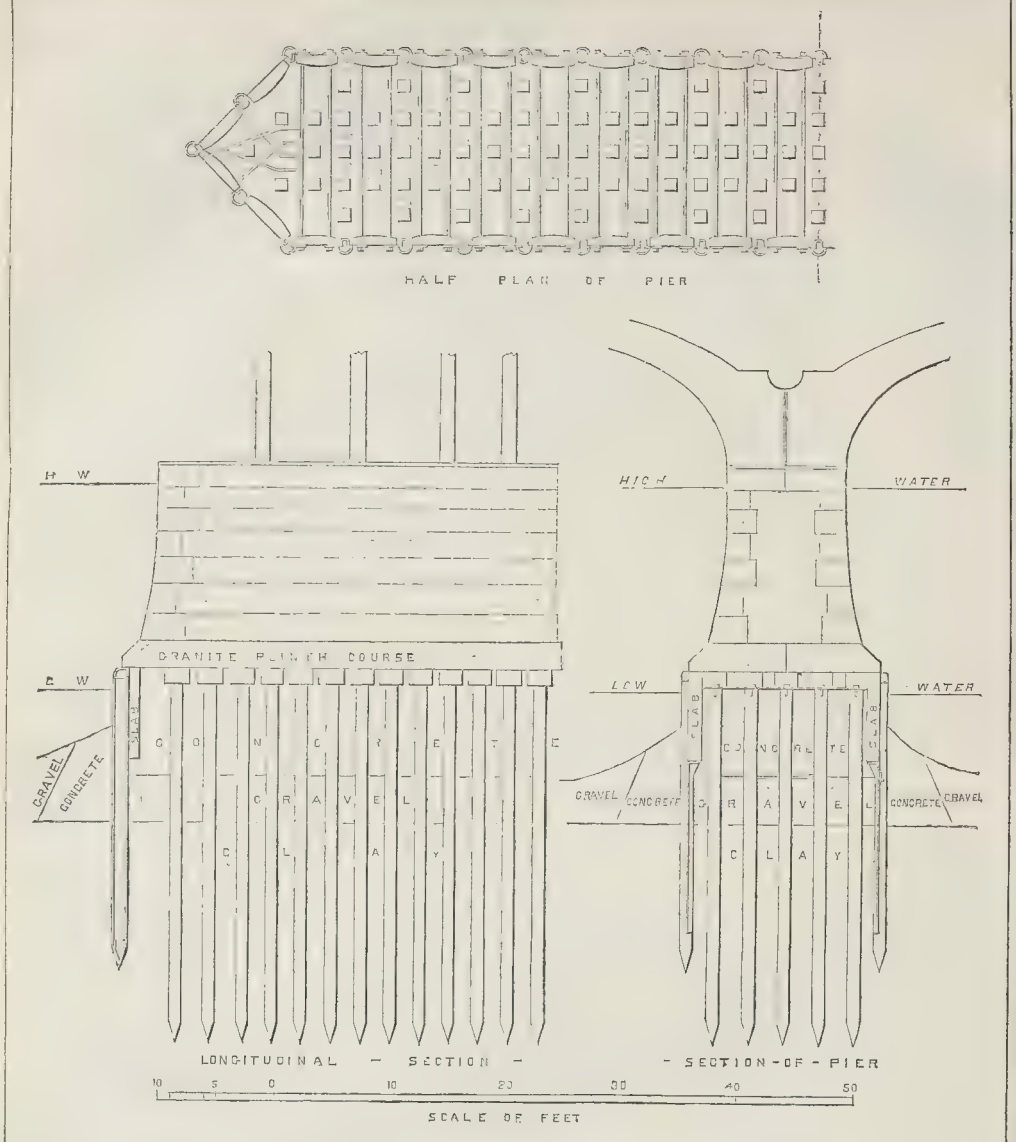
IN our last we offered some information on the subject of foundations for Bridges, with more especial reference to those which were being put in for the proposed bridge at Westminster. Captain Moorsom (who, in a letter published the other day, applies a term to the new structure not justified by the report of the committee, or the actual state of affairs) once claimed, we believe, to have made an application of the iron-plate and concrete system of building piers, prior to its use in the Chelsea and Westminster Bridges. In his bridge for the Birmingham and Gloucester Railway, over the Avon, near Tewkesbury, completed in 1840, caissons were formed of cast-iron flanged plates, ⅜ inch thick, screwed together by bolts, and having the joints made with iron cement. The site of each pier was first prepared with a scoop-dredger, worked from a platform erected on piles. The lower row of plates for the caisson was put together and suspended in the water by iron rods, while the other rows were added; and the whole was gradually lowered as the work proceeded, till the bottom rested on the bed of the river. Clay was then thrown round, externally; and this formed a joint impervious to water,—so that the caisson was emptied in six hours. Subsequently, as we understand the account, excavations went on inside the caisson; which was next filled for the first 12 feet with solid masonry and concrete; and upon this, hollow masonry was laid to support the "cap-plates," carrying eight pillars in each pier. The caissons taper upwards for part of their height.* The suggestion of the use of this method of construction originated with Mr. Ward, of Falmouth, who was the resident engineer. The method was represented as cheaper than "coffer-dams and stone piers."

But, judging from the account, it may be doubted whether the coffer-dam principle was really dispensed with; for certainly the description of Captain Moorsom's bridge and that of the new Westminster-bridge differ in some important particulars. Mr. Page, in the course of his statement to the committee, has given a long list of bridges founded without coffer-dams, with piers similar to, or less durable than those of his own design. In the Westminster-bridge the piers below low-water are formed of a series of wooden piles, with concrete filling to the inter-spaces, inclosed by an external casing of cast-iron to the pier. In each pier are 145 elm piles, chiefly in rows transversely of three and five alternately. These piles average 29 feet 6 inches in length, and are driven through the gravel, and about 19 feet into the solid London clay, here said to lie at from 28 to 32 feet below Trinity high-water mark, with a uniform surface. The cast-iron piles are of two kinds, namely, hollow round piles, of 15 inches diameter, with grooves or flanges cast on them, and plate or flat piles, cast with flanges for strength. These two kinds of piles are placed alternately, the flat piles being driven down after the round piles between the grooves or flanges of the latter; and thus, say the reporters, "it is proposed to inclose within an iron case not only the wooden piles and concrete deposited inside the piers, but also the bed of the river, gravel, and clay, to the depth to which the plate piles are driven, that is, to 21 feet below low-water." The loose mud and sand are then removed from the inclosed space down to the gravel: by aid of the diving dress the opposite cast-iron piles are then united by strong wrought-iron tie-bolts in two tiers; and lastly, the concrete is deposited between the wooden piles, or throughout the unoccupied area of the pier within the casing, up to the level of low-water. It is, however, explained, that the heads of the cast-iron plate piles are driven 6 feet below low water, whilst those of the round piles stand 1 foot above low water. "The spaces so occasioned in the iron casing are filled up with granite slabs, 18 inches thick, the lower end of the slabs resting on the head of the plate piles, and the upper standing 2 feet above low water, ready to receive the first course of masonry. These several works completed, the wooden piles are cut off to an uniform level of 6 inches above low water; a block of stone, 18 inches thick and 4 feet area, is solidly bedded on the head of each bearing pile; the spaces between these blocks are filled in with concrete, and the whole surface of the piers, including the granite slabs, is levelled off to the height of 2 feet above low water, to receive the first course of masonry." This first course is of solid granite, 2 feet thick. Above, the piers are faced, only, with granite, the interior being filled in with brickwork. The masonry of the piers terminates 2 feet above Trinity high-water line, from which level the iron arches spring.

Our engravings on the next page represent the plan of half of one of the piers, showing the top of the iron sheathing-plates and the tie-rods, part of the longitudinal section, and a transverse section of one pier. These differ somewhat from the illustrations given in the report of Messrs. Rendel and Simpson, but show correctly the real intentions of the engineer. Originally it was intended to have an iron curb all round the pier, above the bearing piles, but this has been abandoned, and it is proposed further that the granite plinth course should be made to project sufficiently to protect the piles.

Various modes have been adopted in other bridges for directing the current, and as supplementary precautions against the undermining of piers. We may refer to paving the bed of the river, or the laying an inverted arch; to the depositing stones, or the encasing the platform of foundations with sheet-piling. Mr. Page, however, proposes to dredge the channel out beneath each arch to a regular curve, commencing at 3 feet below low water at the piers,—laying bare the clay at the centre, so as to give a low-water depth there of about 12 feet. Afterwards, all round the piers, for a width of about 6 feet, the gravel is to be dredged out down to the clay, and the trench or excavation thus formed is to be filled with concrete.

Taking the permanent character of the bridge to depend upon the soundness of the foundations below low water, the reporters objected to the method of construction, that the sub-structure of such piers is dependent on the combined action of several classes of materials, differing in their strength and manner of application; that the strength of each part is liable to suffer by the failure of any one; and especially that the fracture, or the improper execution of any portion of the outer cast-iron casing might entail very serious results. Supposing the principle of the sub-structure were a good one, they conceive a coffer-dam would be peculiarly requisite to carry it out with proper supervision, and to ensure the faultless execution which they say the permanence of such a class of work would demand. They question whether the bottom of the river would retain the peculiar form intended to be given to it, and think that the concrete banks round the piers must in no long time be broken up, and the piers weakened "by increase of their unsupported height" and the diminution of the depth and solidity of the material through which the piles of which they mainly consist are driven." They have other objections to the particular scheme of New Westminster-bridge, as proposed by Mr. Page, and irrespective of the system of foundations, and appear to doubt the economy resulting from the construction of the bridge, half at a time, intended to save the cost of a temporary bridge, and on the whole, they "do not feel that any plan which does not comprise solid stone piers and abutments, carried down deep into the London clay, can be regarded as possessing a permanent character."



On looking at the specification of London-bridge, we find that the earth for the foundation there, was required to be excavated to such depth that the tops of the platforms of foundation should be not less than 40 feet below Trinity high-water mark, in the case of the two side piers, and 43 feet in the case of the middle piers; and that when the earth had been excavated, piles were to be driven to sustain the weight of those platforms and the superstructure, as much as 18 feet below the lower side of the platforms, — elaborate contrivances being further provided in their construction, as by the connection of the heads of the piles, filling in of the spaces, and the laying of planks, 6 inches in thickness, bedded in mortar, and by the addition of sheet piling round the circuit of the platform. Thus, a depth of 43 feet, plus 18 feet, or perhaps 20 feet, equal to 63 feet, at a fair computation, may be set down as attained, measured from the level of high-water mark; whereas, in the plan being pursued in new Westminster-bridge, a total depth from the same point, of 48 feet for the bearing piles of timber, and of about 43 feet for the round piles of iron has been considered sufficient,—supplementary protection being sought for by the banking of concrete, which we may take as in lieu of the deep-seated sheet piling of the other case. But, the bearing piles in New Westminster-bridge, do pass nearly 20 feet into the clay,—though they stand about 11 feet above it, or 7 or 8 feet above the gravel. The round piles may be stated as extending 12 or 13 feet into the clay, and as having the same height above. It is possible that a greater depth might have been secured without the aid of coffer-dams. Thus, the question of the advantage of the system of founding and building piers, depends upon other elements in the investigation. The permanance of the iron casing seems to be the chief subject for notice.

Mr. Hawkshaw, in his evidence, stated, Mr. Mallett's experiments showed that the mean corrosion of iron in what he calls clear fresh river water was one grain per square inch of surface. "Now the weight of a cubic inch of iron is 1,700 grains, and this was the amount of corrosion in two years. The result of that would be, that supposing only one surface of cast-iron plate were exposed, then it would take 3,362 years totally to corrode a plate an inch thick; but if both surfaces were exposed, it would take 1,681 years to eat through a plate an inch thick,—of course assuming that experiment as the basis."

The result of an experiment where cast iron was immersed in foul sea-water was, that it would take 506 years to eat through an iron plate, acting upon one surface, and 253 years to eat through it acting on both surfaces. Any irregularity of action, as arising from the quality of the iron, might, of course, lead to a different result.

Mr. Hawkshaw, we may add, thought the work had been done exceedingly well, and that the foundations were fully equal to what they had to do. He did not think the embanking of the Thames would affect the bed of the river at

* Minutes of the Institution of Civil Engineers. Vol II., 1844, p. 60.

THE FOUNDATIONS FOR PROPOSED BRIDGE AT WESTMINSTER.—Mr. Page, Engineer.

this particular point; and further, was of opinion, that the increased water-way which would be given by the new bridge would lessen the tendency to scour.

Some action on the iron, reverting to the other part of his evidence, can hardly be avoidable: and though that element of weakness may be of trifling moment in the case of wharf-walls, where a mere casing can be renewed, it would be deserving of more notice in what is designed and required to be of still more durable character, and where the substance of the pier would be acted upon but for the presence of the outer shell.

Mr. Page, however, from his own observations of the action of water on cast iron, says "a deposit of oxide of iron is formed on the surface, which actually protects the iron itself;" and Mr. Mallet, who has made experiments in great detail, states that iron coated with purified gas-tar will last for ages.

As to the resistance to concussion by fouling of barges or otherwise, that of course is a very important point. The proposal of the engineer included protection to the piers by floating fenders or booms, and perhaps this provision has created more than its share of prejudice. Such measures of precaution might be thought desirable in any case. The question is, how far any positive dependence is placed upon them.

However, the committee inquiring into the sufficiency of the piers "to bear the weight to be put upon them, and how far such a construction can be considered permanent," have decided "that the piers will be secure so long as the iron casing remains sound," and that the "casing can be replaced whenever it may decay or be destroyed."

The importance of the structural question is great: it has to do with the sufficiency of the Chelsea-bridge, if not other bridges and foundations, and with the course which should be adopted in many future cases.

Let us look at the answers that were given to the main objections raised by the reporters. Mr. Robert Stephenson, on his second examination, when he had looked into the matter more thoroughly than at first, felt perfectly certain

that the scouring could not take place, and that there was no reason whatever to apprehend any change in the bed of the river. Then, as to the use of coffer-dams, Mr. Stephenson said that if he had been called upon to design a bridge in that situation, he should have the spans as large as possible, and have used coffer-dams; "*but*, to use a coffer-dam now, with such spans, would actually fill the river up; you could not do it. Therefore, if you once fix the spans to be adopted, you negative the adoption of coffer-dams." Now, as it seems that the small spans were fixed for Mr. Page (very foolishly as we have always thought, and as we noticed long ago when giving a view of the proposed bridge), Mr. Page can scarcely need a more complete exoneration in this respect.

Desiring homogeneity, Mr. Stephenson further stated, he would not put any weight upon the iron and granite casing, and he believed that the piers wholly detached from this were amply sufficient to bear the weight. He saw no insuperable obstacle to building the second half of the bridge as proposed, and first suggesting some additional provision with regard to the expansion and contraction of the iron, he thought there was nothing to fear in going on with the work. The greatest inconvenience that might arise, whether it was 50, 100, or 150 years hence, he thought would be from the decay of the iron which might have to be replaced.

After very full consideration of the subject, we have arrived at the same conviction, and we trust that Mr. Page will be permitted forthwith to carry out his design to completion, with such improvements as may have been suggested, or have suggested themselves, during the inquiry, and that, so far from finding any additional cold water to contend with, beyond that provided by Father Thames, he will be strengthened and encouraged by the good wishes of his professional brethren, and the generous confidence of the governing powers.

ON THE DRYING AND BURNING OF BRICKS.*

In the preceding paper I arrived at that stage of the manufacture in which machinery may be considered to have rendered us all the aid that we require of it, and left the plastic clay formed into bricks. In proceeding with the manufacture, we have next, by means of evaporation, to get rid of the water with which it was necessary to work the clay for the purpose of making it ductile. The oldest system is that of laying the bricks, as moulded, on floors or flats. These are spaces of ground worked very smooth, of a slightly convex form, from six to ten yards wide, and of any desired length. The bricks are exposed on these flats until they are stiff enough to bear being removed by hand: they are then walled or hacked on each side of the floors, from six to twelve high, one row on another, with a space of from half to three-fourths of an inch between each brick, to allow a current of air between them. They are then covered with roofing tiles, or tiles made on purpose, and, in some instances, with straw; then left until they are sufficiently dry for the last process—burning. In some works the bricks are hacked as they are made, by the use of pallet-boards, and as explained in the making by the machine. This is the general system of the present day, and the reason why the manufacture is restricted to one season of the year. For during the winter, the late autumn, and the early spring, on account of the lower temperature of the atmosphere, shorter days, and absence of sun, the bricks would be a very long time in drying, and a frost would totally destroy all containing any moisture. In dull, damp seasons, this process is very slow and tedious. The bricks are also much deteriorated in quality from the washing of the rains on the floors, or against the ends of them in the hacks. In such seasons, a brickmaker, in order to get over his usual amount of work, often requires double the extent of drying ground, each moulder occupying about half an acre of land for this purpose only; and the extent of ground required gives to brick-works near London the title of brickfields, and in the country that of brick-yards. Bricks are sometimes dried in hacks under sheds, but for large works, in which machinery is used for making them, the quantity of shedding required would be so great, that it would be better to erect more improved constructions.

When the brick is partially dry, and quality is a consideration, it is the practice in some works, where hand-making is adopted, to dress a portion of the bricks by hand with boards called tappers, or by means of a small machine called a brick-press, of which there are many excellent ones made. The brick is placed in a metal mould, and by means of a powerful leverage is subjected to considerable pressure, which gives it a very smooth face, and produces the best front bricks. Some of these machines have single and others double moulds. I prefer the latter, as, while one brick is being pressed, the brick previously dressed is removed, and another fed in, which saves much labour and time over the single-mould press. Although these machines do not exert a tithe of the force employed by the dry clay making machines, we often see the bricks pressed by hand only, when made from plastic clays, blown to pieces, and their outer surfaces shelled off, from their not being able to be dried entirely throughout. Brick-makers should select their most loamy earths for making bricks which are afterwards to be pressed for front stocks. Pressed bricks must be thoroughly dried previously to their being placed in the kiln. A good machine produces bricks of such a quality as renders the above process unnecessary.

The drying of bricks ready for burning is a matter of great importance, and requires more attention than it generally receives. From hand-made bricks we have to evaporate some 25 per cent. of water before it is safe to burn them. In a work requiring the make of 20,000 bricks per day, we have to evaporate more than twenty tons of water every twenty-four hours. Hand-made bricks lose in drying about one-fourth of their weight, and in drying and burning about one-third. The average of machine bricks—those made of the stiff plastic clay—do not lose more than half the above amount from evaporation, and are, therefore, of much greater specific gravity than hand-made ones.

The artificial drying of bricks is carried on throughout the year uninterruptedly in sheds having the floor heated by fires; but this can only be effected in districts where coal is cheap. The floors of these sheds are a series of tunnels or flues running through the shed longitudinally. At the lower end is a pit, in which are the furnaces: the fire travels up the flues under the floor of the shed, giving off its heat by the way, and the smoke escapes at the upper end, through a series of (generally three or four) smaller chimneys or stacks. The furnace end of these flues would naturally be much more highly heated than the upper end near the chimneys. To remedy this, the floor is constructed of a greater thickness at the fire end, and gradually diminishes to within a short distance of the top. By this means, and by the assistance of dampers in the chimneys, it is kept at nearly an equal temperature throughout. Bricks that will bear rapid drying, such as are made from marly clays or very loamy or siliceous earths, will be fit for the kilns in from twelve to twenty-four hours. Before the duty was taken off bricks, much dishonesty was practised by unprincipled makers, where this drying could be carried on economically. Strong clays cannot be dried so rapidly. These sheds are generally walled round with loose bricks, stacked in between each post or pillar that supports the roof. The vapour given off from the wet bricks, rising to the roof, escapes. This system of drying is greatly in advance of that in the open air, for it produces the ware, as made, without any deterioration from bad weather; but the expense of fuel to heat these flues has restricted its use to the neighbourhood of collieries. In 1845 I turned my attention to the drying of bricks, and carried out experiments in drying the ware with the waste heat of the burning kilns. The caloric, after having passed the ware in burning, was carried up a flue raised above the floor of the shed, and gave off its spent heat for drying the ware. A model of my kiln and drying-shed was exhibited at the Royal Agricultural Society's meeting at Northampton, in 1847, by Mr. Bullock Webster, who was so pleased when witnessing it at work, that he asked my permission to have the model made to be exhibited. Although this kiln was most useful in proving that the waste heat of a burning kiln is more than sufficient to dry ware enough to fill it again, I was obliged to abandon it on account of the construction of the kiln not being good. This difficulty is now entirely removed, by a kiln which I shall have to describe presently.

Another system of drying is in close chambers, by means of steam, hot water, or by flues heated by fire under the chambers. I will, therefore, briefly describe the steam chamber as used by Mr. Beart. This is a square construction, or series of tunnels or chambers, built on an incline of any desired length; and at some convenient spot near the lower end is fixed a large steam-boiler, at a lower level than the drying-chamber. From the boiler the main steam-pipe is taken along the bottom or lower end of the chamber, and from this main, at right angles, run branch pipes of 4 inches diameter up the chamber, 2 feet apart, and at about 3 feet from the top or arch. From there being so close and shallow a chamber between the heating surface of the pipes and the top, and so large an amount of heating surface in the pipes, the temperature is soon considerably raised. At the top and bottom ends are shutters or lids, which open for the admission of the green ware at the upper end, and for the exit of the dry ware at the lower end of the chamber. Over the steam-pipes are fixed iron rollers, on which the trays of bricks, as brought from the machine, are placed, the insertion of one tray forcing the tray previously put in further on, assisted in its descent by the inclination of the construction. The steam being raised in the boiler, flows through the main into those branch pipes in the chamber, and from the large amount of exposed surface becomes condensed, giving off its latent heat. From the incline given to the pipes in the chamber, and from the main-pipe also having a fall towards the boiler, the whole of the warm water from the condensed steam flows to the boiler to be again raised to steam, sent up the pipes, and condensed intermittently. The steam entering at the lower end of the chamber, it is, of course, warmer than the upper end. Along the top end, or highest part of the chamber, is a series of chimneys and windguards, through which the damp vapour escapes. The bricks from the machine enter at this cooler end charged with warm vapour, and as the make proceeds, are forced down the chamber as each tray is put in. Thus, those which were first inserted, reach a drier and warmer atmosphere, and on their arrival at the lower end come out dry bricks, in about twenty-four hours, with the strongest clays. In some cases the waste steam of the working-engine is sent through these pipes and condensed. Bricks will dry soundly without cracking, &c. in these close chambers, when exposed to much greater heat than they would bear on the open flue first described, or the open air, from the circumstance of the atmosphere, although very hot, being so highly charged with vapour. In practice these steam chambers have proved many principles, but they are not likely to become universal, for they are very expensive in erection on account of the quantity of steam pipes, and involve constant expense in fuel, and require attention in the management of the steam boiler; but their greatest defect is the want of a current of hot air through the chamber to carry off the excess of vapour faster than is now done. The attaining a high degree of temperature in these chambers is useless, unless there is a current to carry off the vapour. Why should this piping be used, or steam at all, when we have a large mass of heat being constantly wasted, night and day, during the time the kilns are burning? and after the process of burning the kilns is completed, we have pure hot air flowing, from forty-eight to sixty hours, from the mass of cooling bricks in the kilns, free from

* A second paper by Mr. Humphrey Chamberlain, read at the Society of Arts.

carbon or any impurities: this could be directed th[illegible] constant flow of hot dry air, and escaping in warm vapour. The waste heat during the process of burning can be taken up flues under the chamber, and thereby all the heat of our burning kilns may be economised, and a great outlay saved in steam pipes, boilers, and attention. It must not be forgotten, also, that so large an atmospheric condenser as the steam-chamber is not heated without a considerable expenditure in fuel. This drying by steam is a great stride in advance of the old flued shed, but practical men must see the immense loss incurred constantly from this source of the spent heat of the burning kilns, and that by economizing it, an immense saving will be effected in the manufacture. The kilns are constructed as near the lower end of these chambers as convenient.

A kiln for attaining the object of the one I built in 1846 is now at work at Epsom, at Mr. Hand's brick-works, but with this difference, that the smoke is consumed. The drying-shed is kept quite close, that the hot flues may raise the temperature so high as to dry the ware. In this kiln the heated gases escape from the top, after passing up through the ware, into a flue, and are carried to the ground, and thence into the drying-shed, which is a very large construction in proportion to the size of the kiln, and holds nearly sufficient ware to fill four kilns. In the shed the heat passes up a hollow wall, about 6 feet high, and after running through the length of the shed on one side, returns down a similar flue on the opposite side of the shed, and is again carried to the kiln, through the bottom of which it passes in two close flues between the three kiln-furnaces, with the exception of small apertures through which the heat enters to consume (as I am informed) the smoke, but I have not been able to see it at work, and therefore cannot speak on this point. I fear there must be a loss of heat to consume this smoke, which has travelled some 300 feet or 400 feet: this should be done in the furnace before it enters the ware, and so be economised. From these return flues the spent gases rise up a shaft at the end of the kiln. One result of carrying this return flue through the kiln, is the attaining a great draft or suction in the flues to carry off vapour. If Mr. Hands were to erect three more kilns, and so work four into his present drying-house, he could always have it highly heated, as one kiln would be burning and another cooling continually, while the other two were being respectively filled and emptied. By this means he would realise a much larger return from his spent heat. He has now to raise the temperature of the whole construction each time he burns, from that of the atmosphere to a drying heat of about 90 degrees.

The burning of bricks is exposing the clay to such a degree of heat as to change its character from a merely absorbent lump of dry earth to a hardened, indestructible, partially vitrified mass, or artificial stone, which will withstand the action of the atmosphere. The effect of fire on clays, or brick-earth, varies with the proportion and number of earths and salts of which they are composed, and the different per centage they bear one to another. Clay, or pure alumina, is infusible, but on exposure to great heat, contracts greatly in bulk. It is this property which regulates the action of Wedgwood's pyrometer. Alumina combined with silica, or alumina combined with lime, will withstand the most intense heat which can be obtained in a furnace; but if we mix these three earths, alumina, silica, and lime together, they then melt at a very low heat; the lime acting as a flux on the silica; and, according to Dr. Ure, in his "Dictionary of Arts," the more readily the nearer the mixture approaches the following proportions, viz.,—Alumina, ½; lime, ⅛; and silica, ⅜: by adding two parts more of sand, it becomes infusible. The Devonshire and Dorsetshire plastic clays are composed of silica, ⅝, and alumina, ⅜: they burn very white, and form the basis of earthenware.

The clays and loams generally made into bricks contain protoxide of iron. If a clay has a large per centage of iron, and a small per centage of lime, the silica and alumina, the body of the ware, will withstand a much higher temperature than is required to flux the iron. By attaining a sufficient heat the iron melts and completely cements all the pores, giving the brick a metallic coating; so that on being immersed in water these bricks are very slightly absorbent. The bricks made from London clay, about Uxbridge, and burnt in what are called close fire-clamps, take from 10 to 15 degrees Wedgwood to burn them sufficiently hard: the fire-bricks of Stourbridge take 85 degrees; the vitrified blue bricks of Staffordshire 95 degrees; and the vitrified bricks of North Wales require 120 degrees Wedgwood, or the same heat as an iron smelting furnace. It will be seen, from what I have stated, with how varying a material we have to deal. In one case we have to attain the heat of the smelting furnace, and in another we are not much to exceed a low red heat, or the whole of the kiln or clamp would become one lump of useless slag. Clays contract in the burning as well as in drying: in order to correct this, therefore, it is desirable to work up sufficient silicates, as loam, sand, &c. with strong clays or very plastic earths. A good tile clay, that will dry and burn soundly in a thin body, or a perforated brick, will fly in the fire in so large a mass as a solid brick.

In the case of refractory clays, if, as soon as the kiln is burnt, a little common salt is thrown into the fires, from the intense heat of the interior it is immediately volatilized: the kiln then being closed up, and the fumes retained, an effect is produced on some clays of glazing the bricks, and on others of changing their colour, particularly if the clay is charged with iron, to a much darker hue, the soda acting as a flux on the iron and silica: for the effect of the chlorine we must appeal to the chemists. Stone ware, or Dorsetshire clay, takes a salt glaze. Salt must be very cautiously used, until its action on the clay is proved, for brick-earth becomes much more fusible when exposed to the vapours or gases from salt, and will be in danger of being melted. The use of sulphurous coal for brick-burning is esteemed by many makers, from the bricks having a harder appearance and better colour. The colour to which bricks are burnt, varies throughout the country. In London the white bricks are esteemed, although from the smoky atmosphere they soon obtain a different hue. Suffolk, Devonshire, Dorsetshire, Cambridgeshire, and Essex, produce white bricks of the best quality. The general colour of bricks throughout the country is red, but in Staffordshire, Shropshire, Worcestershire, and other coal districts, they are what are termed blue bricks, and are of the colour of cast-iron.

The chemical action of salts thrown into the fires of brick-kilns for the purpose of fluxing, or burning the ware at a lower temperature, or giving a better colour or appearance to the bricks, has not been sufficiently experimented on. This should be undertaken by the chemist, as the brickmaker, without his assistance, may try many useless experiments.

To explain fully the various processes of firing adopted for the different classes of earths, or more generally the different districts of the country, would occupy more time than the limits of this paper will allow. Each county adopts a distinct mode; and in some counties there are used two or three different constructions of kilns, or principles of firing the ware. I will, therefore, briefly allude to the general systems adopted, and more particularly explain those improvements which have taken place, and stood practical proof of their utility. A subject which has formed the basis of 230 patents cannot be fully explained in so brief a space. Besides this there are many improvements not protected by patents.*

* To be continued.

FALL OF PART OF A CHURCH AT DERBY.—On Sunday in last week the gable end of the chancel of St. Michael's Church, Derby, gave way, and the casing fell into the churchyard, shaking the fabric of the church, and spreading consternation through those assembled within its walls. The service was prematurely concluded, and the congregation, in terror and alarm, hurried out of the edifice. Fortunately no accident occurred.

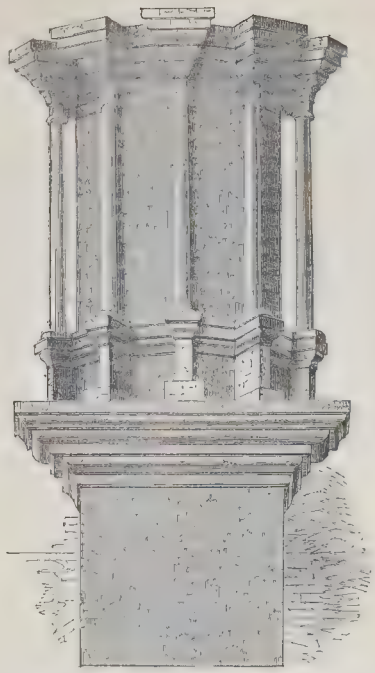
PROPOSED GOVERNMENT COMPETITION.

PUBLIC OFFICES.

In pursuance of the intention of the Government to invite designs from architects of all countries for an Office for the Secretary of State for Foreign Affairs, an Office for the Secretary of State for War, and for laying out the ground between the Thames and St. James's-park, adjoining Great George-street, mentioned in our last, the Chief Commissioner of Works, Sir Benjamin Hall, invited a number of architects to meet him on Monday last at the Office of Works, that he might hear their opinion as to the particulars and instructions to competitors he proposed to issue. Mr. Hunt was with Sir Benjamin, and there were present, Sir Charles Barry, Mr. Tite, M.P.; Mr. Hardwick, Mr. Burn, Mr. John Shaw, Mr. T. H. Wyatt, Mr. M. D. Wyatt, Professor Hosking, Mr. Ferrey, Mr. Godwin, Mr. Scott, Mr. Mair, Mr. Bellamy, Mr. Pownall, Mr. Clutton, Mr. P'Anson, Mr. Poynter, Mr. Jas. Knowles, Mr. Railton, Mr. Pennethorne, and others. Mr. Sydney Smirke was prevented by indisposition from being present.

Some were there ready to protest against throwing open the competition to foreign architects, and others against any competition at all; but the Chief Commissioner informed them that these points had been settled in Parliament, and would not be opened. The proposed instructions were then read and discussed, and now stand as follow:—

"It is proposed to invite architects to offer designs for two new public offices, one for the use of the Secretary of State for Foreign Affairs, the other for the use of the Secretary of State for War. These buildings are intended to be erected on a site between Charles-street and Downing-street. The drawings are to be made to a scale of 16 feet to an inch, the plans and sections being tinted with light brown Indian ink, and the elevations in line only. Enlarged details to a scale of 4 feet to an inch, and perspective (not bird's-eye) views, tinted with light brown Indian ink, may accompany the respective designs. General specifications of the materials proposed to be used in the intended buildings must accompany each design. Lithographed plans of the site, together with particulars of the accommodation required, and the dimensions of the principal apartments, will be furnished to such architects as may apply for them.



Architects are farther invited to send in a general block plan, to be drawn to a scale of 44 feet to an inch, showing how the site lying between Whitehall on the north, Great George-street and New Palace-yard on the south, St. James's-park on the west, the river Thames on the east,—provided always that any line of embankment shall not exceed the line laid down upon the ground-plan to be furnished), may be so appropriated that the two buildings now proposed to be erected may form part of a large and comprehensive scheme for concentrating the principal public offices, and for the improvement of the leading thoroughfares, including Westminster bridge, whether as regards its present or any other site.

Premiums will be awarded to eighteen of the most successful competitors, in three classes, according to the following scale, provided the commissioners should consider the respective designs worthy of the intended rewards:—

For the best design for the War Office, a premium of	£800
Second	500
Third	400
Fourth	300
Fifth	300
Sixth	100
Seventh	100
For the best design for the Foreign Office, a premium of	£700
Second	400
Third	300
Fourth	200
Fifth	100
For the best design for a block plan, a premium of	£500
Second	200
Third	100

All designs for which premiums shall be given are to become the absolute property of the commissioners.

The designs are to be delivered to the Office of Works, London, on or before the 1st day of February, 1857. They are to be distinguished by mottoes, and to be accompanied by a sealed letter containing the

MOULDED BRICK CHIMNEY-SHAFT.

author's name and address, with a corresponding motto on the outside.

If the architect whose design for either the War Department or the Foreign Office is considered the best should be appointed to carry out the work, he will be paid five per cent. on the outlay, but in that case he will not be entitled to receive the premium."

The only change agreed to was the substitution of a scale of 16 feet to an inch for one of 10 feet to an inch and a quarter, with the view of lessening the labour of competitors. Amongst the points discussed was the nature of the tribunal and desirability of giving some information on the subject. Sir Benjamin objected to its being fixed in the first instance, but inclined to a mixed jury of professionals and amateurs, and said it was proposed to exhibit publicly all the designs in Westminster Hall *before* coming to a decision,—a very desirable arrangement. Although no pledge would be given, it was understood that the successful competitors, if competent, would be employed to carry out their designs, and would receive the usual commission of 5 per cent.

The premiums amount in the whole, it will be seen, to 5,000*l.* The amount of expenditure is left to the competitors: no estimate of cost is required. No disposition is manifested in favour of any particular style.

The course adopted, prompted by desire for expedition, can scarcely be considered the best calculated to obtain a grand whole. A design should first have been obtained for laying out the whole of the land at the disposal of the Government with reference to the various offices and buildings likely to be required; and *then* designs should have been sought for the two structures named, to occupy such positions as might be most consistent with the best distribution of the whole.

We would farther urge that more time should be allowed the competitors for the preparation of designs.

British Archæological Association.—We reserve our report of the Archæological Congress till next week.

MOULDED BRICKWORK—CHIMNEYS.

As moulded brickwork has been much talked of lately, I send you a sketch of a chimney of an old house in Blandford, which is, I think, a good specimen of moulded brickwork. The bricks are thin and well made, and the columns appear to be burnt, of the same material. The form of chimney is a decagon (on a square base), having a column at each angle. The house is one of the few which escaped when the town was nearly destroyed by fire on the 4th of June, 1731. It is the property and residence of Mr. W. C. Fincham. The sketch may possibly interest some of those who are advocates of moulded brickwork. Jas. B. Green.

STEEL AND MALLEABLE IRON MADE WITHOUT FUEL.

The iron interest has been somewhat startled and excited by the paper, read at the Cheltenham meeting of the British Association for the Advancement of Science, by Mr. H. Bessemer, "On the Manufacture of Malleable Iron and Steel without Fuel;" a discovery already tested, according to Mr. Bessemer, by experiment on a great scale. In one sense the process is not effected without fuel, because it is crude iron already melted by means of fuel that is converted into steel and soft iron; but in place of the iron being reheated, and subjected to the puddling process by means of a second application of fuel (chiefly mineral in this country), and afterwards worked up in small pellets into a malleable state, the whole furnace of melted iron is at once transferred to a second furnace, where there is no fuel for keeping it in a melted state, but where a blast of condensed air acting on the carbon in the iron itself, not only consumes that carbon, but produces such an intense heat that the metal boils with violent agitation, and the malleable iron, which is thus ultimately and rapidly made, itself arrives at a white heat, and continues in a melted state as if it were still perfectly fluid crude iron, so that even scraps of tough iron and steel are also melted in it by means of the surplus heat produced by the mere action of the oxygen of the air-blast on the carbon of the iron. Thus, in place of the immense labour and tedious delay of the puddling, hammering, and rolling processes, and the comparatively small scale on which, only, good malleable iron or steel can as yet be in this way formed, superior kinds of cast steel and malleable iron, it is said, are yielded as it were by wholesale, or on a great scale, in course of less than half an hour! with a loss of only 18 per cent. in place of 28 on the quantity of crude iron used, a large portion of this loss, moreover, being easily recoverable.

If there be no exaggeration here, the productibility of cast steel and malleable iron will now, and only now, become commensurate with the great scale on which pig-iron has heretofore been produced, and the cost of both cast steel and soft iron accordingly, as well as from saving of fuel and time, be immensely reduced.

The quality of the iron is said to be equal to that of charcoal iron, and that of the steel to be capable of being made, by a mere extension of the ingot, of a far superior quality to that which such an extension produces in blister-steel.

During the short time in which the melted metal is undergoing its fiery purification, it passes through the various states of hard and soft steel, semi-steel, and malleable and soft iron, according to the quantity of carbon consumed, so that by tapping the reservoir at different times, the different kinds of metal are at once obtained. When the metal has lost all its carbon, and is become a soft malleable iron, it is still perfectly fluid, and not a mere pasty mass, so that even then it is readily tapped and run off at once into bars, beams, or any other form, and of any dimension short of the whole quantity produced.

Since the above was written, Mr. Bessemer's magnificent discovery has been formally tested, in presence of many competent judges, and the result, in the formation of ingots of cast-steel 6 cwt. in weight, from a mass of crude iron 6 cwt. 3 qrs. 18 lbs. in weight, after less than *ten minutes boiling* and washing in its own oxide, was unanimously declared to be perfectly satisfactory. A few minutes more would have converted the steel into pure soft malleable iron. Mr. David Mushet, who appears to have seen at a glance the immense importance of Mr. Bessemer's discovery, without waiting any test of its value, declares, in the *Mining Journal*, his full "conviction that Mr. Bessemer has brought into the world one of the grandest operations ever devised in metallurgy,—a truly magnificent process," which, as he ingenuously remarks, "might easily have been predicted by any of us had our nodding and winking faculties been inspired with the wit to think to the purpose." Mr. Bessemer has been two years in maturing his great discovery; but, as scarcely ever fails in such circumstances, he is not, it appears, to be left in exclusive possession of the fruits of his genius, a Yankee patentee having already employed a patent agent to lay claim to it, on the ground that, on 15th September, 1855, he appropriated this very process to himself by patent taken out in this country. How it was that so splendid a discovery, secured so long ago by patent, was not generally heard of, or did not make itself widely known, long ere Mr. Bessemer explained his new process the other day, is not stated.

It now appears that while the Woolwich department of our own Government fatuously pooh-poohed the discovery, or "sought to throw cold water on it," as the *Times* remarks, "by alleging that Mr. Nasmyth had already made substantially the same discovery, which that gentleman has since been the first to disclaim," the French emperor to whom also Mr. Bessemer explained his process, had the penetration to appreciate its vast importance, and the disinterestedness and generosity to afford him great facilities for conducting his experiments (then in an imperfect state) to a successful result.

No discovery in the iron manufacture since Cort's, at the close of last century, has ever given such promise as this of Mr. Bessemer's. To begin with, it at once not only renders this country independent of Russia and Sweden for the finest qualities of iron,

but while these qualities are sold here at from 20*l.* to 30*l.* a ton,—by the new process iron of equal quality can be made at a cost actually 2*l.* per ton less than the present cost of common English iron! What, too, may not be anticipated from the power, thus put into our hands, of casting malleable iron beams limited, in immensity of dimensions, only, perhaps, by the limits of our mechanical or other power in transporting them from the place of their production to that of their ultimate destination!

"Cast malleable iron," says Mr. Mushet, "in the very limited scale on which it has hitherto been produced, has been characterized by excessive red-short; but on the scale of Mr. Bessemer's production this may be entirely altered, or successfully removed. The economic basis he has fixed is so broad that there is room to rear any amount of superstructure. The success of the new process will re-act upon the management of the blast-furnace, and render unnecessary the present wasteful system of manufacturing forge-iron for the puddling furnace. This and the refining will be superseded with a vast economy in all branches of the manufacture. After seventy years' use, one of the inventions which has made Britain great is threatened with antiquation, but the grooved roller is likely to remain a little longer. Mr. Bessemer has, I think, invented something *equally calculated to stimulate the passions and the devices of the base, the mercenary, and the ungrateful.* This discovery throws distinctive light upon many details of the blast-furnace, well known, but never rightly understood; but space will not now permit a reference to them. I know nothing," he adds, "of Mr. Bessemer except his name, his centrifugal pump, and now this gigantic cupel, but I am always eager to express my sense of great merit. Besides the enormous capacity of his process for the manufacture of iron and steel, he has realized a method for effecting a working temperature infinitely exceeding what has ever yet been attained in the arts, except by intense electro-chemical currents; and it is impossible to foresee what may be the range of ultimate and general consequences from this invention."

PROVINCIAL NEWS.

Great Grimsby.—The Corn Exchange is nearly completed. The body of the building is of red and white brick. The tower is of stonework. The cost, with site, will be about 9,000*l.* to be paid off in thirty years by instalments.

Alford.—The erection of the Corn Exchange here has commenced on the site of premises which have been pulled down in the market-place.

Lynn.—The Norfolk estuary works, which have been stopped for some time, in consequence of the want of clay for the training banks, have been recommenced, a supply of material having been found in the old channel.——The materials of the old workhouse, with the land on which it stands, containing about three roods, were put up to auction on Tuesday in last week. The reserve was fixed at 1,400*l.* but the highest bidding was only 1,130*l.* and no sale was effected. A strong competition, according to the *Norfolk Chronicle*, was expected for this site, which is situated in the best part of the town.

Newbury.—It is in contemplation to make a new road from the bridge into the market-place. A correspondent of the *Reading Mercury*, who approves of the proposal, states, however, that while the plan, from destroying six houses, would cost 6,500*l.* another which he suggests would only cost 4,000*l.* including the re-erection on an eligible site of the mansion-house, with wings in Crystal-palace form for a corn-exchange: by this plan, he says, only two houses, the *Newbury Herald* and *Reading Mercury* offices and another (both in the centre of the Market-place) would require to be removed.

Horley.—The first stone of Burstow Hall, the mansion of Mr. Francis Kearsey, between the Horley and Three Bridges stations, on the London and Brighton Railway, was laid on Tuesday before last by his son. The mansion will be built in the Italian style of architecture after a design of Mr. H. Flower, of London, architect.

Frome.—The inconvenience so long felt in this place, for want of suitable accommodation, is likely soon to be remedied, by the erection of a market-house. A convenient site has been purchased, and the building is to be commenced forthwith, chiefly, it is said, at the expense of the Earl of Cork.

Devonport.—The War Department has given Mr. G. Roach the contract for erecting the north wing of the new barracks at Devonport, the cost of which is estimated at 56,000*l.* The buildings in the Ligonier and Frederick squares, and the Picquet stables, will be taken down, and the whole of the materials sold by auction. It is also intended by the Government to appropriate a portion of George's-square for the erection of barracks for married men, the contract for building which will soon be made public. The old barracks will be taken down, and a considerable portion of the site will be thrown into the Mount Wise parade. When the barracks are fully completed, including the Royal Marine Corps, Artillery, &c. the garrison, it is said, will accommodate about 7,000 troops.

Alvechurch.—On the 7th inst. the corner-stone of new national schools for the parish of Alvechurch, designed by Mr. Butterfield, who is also the architect of the new rectory just completed, was laid. The site is in the neighbourhood of the church and the new rectory. On the completion of the new schools it is hoped that sufficient funds will be raised for the restoration of the parish church, which has suffered much from neglect and mutilation.

Manchester.—The extensive range of buildings erected for the new Manchester workhouse at Crumpstall will probably be ready for occupation in March next, according to the *Courier*. The building will accommodate 1,700 persons, and measures about 700 feet long by 400 feet broad. The works are under the supervision of Messrs. Mills and Murgatroyd, the architects. A stone entrance marks the front of the building. No steps have yet been taken relative to the supply of water; and it is not decided whether to bore for it, in which case it is believed an abundant supply would be obtained, or use the equally abundant corporation water, which would have to be brought upon the ground. Pipes are being laid for both water and gas: the fittings of the latter are done by Messrs. Owen and Robinson, Manchester. No disturbance has resulted from the bricksetters' labourers since the outbreak which consigned several of them to the assizes. The cost of the entire building will be about 50,000*l.* A considerable portion of the land will be devoted to "test" labour. The test for women will be in the washhouse and laundry, which are very extensive. The able-bodied will thus earn their living. There will be schools and playgrounds for boys and girls, and workshops for teaching trades to the boys, as well as for teaching the girls the occupations suited to their age and sex. There are also imbecile wards, an infirmary, &c.——The corporation workmen, under the direction of the improvement committee, Mr. Shorland, the city surveyor, and Mr. Langtry, the surveyor of Chorlton, have commenced widening Oxford-street, an improvement long contemplated and much needed. In the narrowest part it is only 12½ yards wide: when the improvement is effected, there will be a general width of at least 20 yards.

Stockport.—The internal arrangements of the grammar-school have undergone extensive revision and improvement, under the suggestions of the architect, Mr. Hardwick, of London, the stonework having been executed by Mr. S. Bann, and the brickwork by Mr. Barlow, both of Stockport.

Oldham.—The new building for the Oldham Lyceum, at the corner of Clegg-street and Union-street, is to be publicly opened on the 22nd of next month. The building has two entrances, the principal one being in Union-street, which opens into a large entrance-hall, the most prominent object on entering which will be a window of stained glass opposite the entrance and above the first landing on the staircase. The window bears representations of science, art, history, and fame, and is the work of the St. Helen's Plate-glass Company. The basement floor contains two class-rooms, 14 yards by 9. The news-room on the ground-floor is 14 yards by 9, lighted by five windows, and two eight-light chandeliers. The reading-room, on the same floor, is 9 yards square, and is lighted with three windows fronting Union-street. Behind this room is the library, 5 yards by 9. From the hall, two broad flights of steps, boarded with African oak, lead to the second story, the principal room on which is the theatre or lecture-room, which will accommodate about 300 persons. It is lighted by eight windows, and the roof is ornamented and panelled. In the evening the room will be lighted with a sunburner. The board-room is situated on the centre of the landing, and to the left there are coffee and class rooms. There is a third story at the back of the building, in which there are two rooms: the first, 10 yards by 5, is to be appropriated to discussion and music classes; and the other, which is 9 yards by 6, and is lighted from the roof, for a drawing-class. There is an apartment with a glass roof, adapted for a photographic class, and a fire-proof room for a laboratory. From the photographic class-room a stair leads to the roof of the building, where a considerable space is flagged and walled round, and is intended to be used as an observatory, for which Mr. James Platt, the president of the institution, has presented a telescope. A railing of a design furnished by the Thorncliffe Ironworks Company, near Sheffield, will be placed round the outside of the building. The windows are of plate-glass, from the St. Helen's Plate-glass Company. Connected with the institution is a dwelling-house for the superintendent, and there are separate play-grounds for boys' and girls' classes. Mr. Pennington, of Manchester, is the architect for the building; and the whole of the works are contracted for by Mr. George Whittaker, of Oldham, builder.

Edinburgh.—Among other improvements in progress at Holyrood Palace, the throne-room on the south side of the quadrangle has had a new ceiling of the style of sixteenth century. The throne-room measures about 70 feet by 30, and the surface of ceiling is intersected by moulded ribs, forming panels alternately square and circular, which contain heraldic devices modelled in relief. Besides the heraldic devices, there are numerous other decorations consisting of the fleur-de-lis, rosettes, pendants, &c. the whole being supported by a cornice, enriched with a wreath of rose, thistle, and shamrock intertwined. The old windows are being replaced by new ones of plate-glass, in a style to correspond with those in the other State apartments. The new drive from Abbey-hill to the Queen's Park, passing in front of Holyrood Palace, is now almost completed. An improvement is being made on the drive at the east end of the Duke's Walk, where the line is being diverted to the northward so as to avoid the acute angle at the corner of Parsons-green.

Glasgow.—The foundation-stone of the new Free College and Church was laid on Monday in last week. The buildings are in progress.

St. Andrew's.—Upwards of 1,700*l.* have been subscribed for the erection of a new Town-hall in St. Andrew's.

Londonderry.—The foundation-stone of the Magee College was laid on Monday in last week. Mr. M'Clelland is the contractor, and has engaged about 100 men on the work, whom he has just entertained in a pavilion erected on the grounds.

Drogheda.—A meeting of the inhabitants of Drogheda was held on Monday before last, in the Tholsel, convened by the Mayor, at the request of nearly 200 ratepayers, to adopt measures for erecting two draw-bridges over the Boyne, and to remove all obstructions to the free navigation of the river. Resolutions favourable to the object of the meeting were passed.

SMOKY BRICKS.

My house was built about twenty years ago with bricks from half a dozen houses 150 or 200 years old. The dirt from the old bricks eats through the plastering in my two best rooms, spoiling the paper in about four months, in patches as if the walls were damp, which can hardly be, as the house is cemented outside. Will you please to say, in your next *Builder*, if you can recommend any method for preventing this? I have thought of knocking off the present plaster, then nailing slate laths, upright, against the wall, and lathing and plastering upon them, but should rather, if possible, save that expense and trouble. If you can help me out of my difficulty, I shall feel particularly obliged and grateful. G.

*** Thin sheet-lead, or tin-foil, may be applied advantageously.

NEW HOUSES IN "THE ROWS," AT CHESTER.—Mr. T. Mainwaring Penson, Architect.

NEW HOUSES IN "THE ROWS," AT CHESTER.

No one forgets Chester who has once seen it, with its peculiarly arranged streets, with a public way beneath the first floor of the houses, its ancient walls and red sandstone churches. In respect of its streets, the "Rows" as they are termed, Chester is unique in England, and all who love picturesque effects, and would retain ancient characteristics, will desire that these should not be interfered with. The substitution of ugly brick fronts and sash windows for the old gables wherever repair or alteration has become necessary, has done much injury to the appearance of the streets, and should not be encouraged. We are glad, therefore, to see that in two fronts recently put up under the direction of Mr. T. Mainwaring Penson, the old style has been adhered to, and with good effect. We have engraved a view of them to mark approval of the course pursued. Provision is needed for the eye and mind as well as for the body.

THE ROYAL MONUMENTS IN WESTMINSTER ABBEY.

It will be recollected by most of our readers that owing to a memorial addressed to her Majesty by the Institute of British Architects, Mr. Scott, as architect to the Abbey, was requested by Sir W. Molesworth to report upon the condition of the royal monuments which it contains. His report represented, in strong terms, the mouldering condition of the stone, both Purbeck marble and firestone; and urged that some course should immediately be taken for their preservation, and suggesting a certain degree of partial restoration. The different Antiquarian Societies strongly objecting to restoration, Mr. Scott turned his thoughts to the question of whether some process could not be found by which they could, as it were, be *stereotyped* in their present state, and secured from farther decay. After several means being considered, and some experiments being tried, the following mode of operation was hit upon: a very weak resinous solution in spirits of wine is injected upon the decayed surface by means of a gardener's syringe, the end of which is perforated with numerous fine holes. The small streams from these minute orifices have not strength sufficient to remove the loose scales which hung upon the surface, and which were so tender that the slightest touch of the finger or a brush would cause them to drop. The solution is made in the first instance exceedingly weak, so as to soak, even into the Purbeck marble, as far as the decay has penetrated. The operation is repeated at intervals of a day or two, till the pores are perfectly saturated; and the solution is made somewhat stronger as the work proceeds. The number of coats or applications varies from four to six. And an injection of pure spirits is used at the close to take off any gloss which may appear upon the surface; and, finally, such parts as have scaled off to such an extent that the solution will not secure them, are firmly re-attached by strong shell-lac cement, applied with a pencil. The process has been applied to all the monuments of Purbeck marble or firestone which surround the chapel of the Confessor, including also his shrine, and with every appearance of perfect success. The surface, instead of being loose

and powdery, so that the slightest touch of the finger or the dress brought it off in dust, or larger fragments, is now hard and firm, while the venerable tone of colour—the peculiar charm of these monuments—is scarcely perceptibly altered. We heartily rejoice in this result, which will be hailed, we trust, with satisfaction, both by those who favour and those who discountenance restoration. The only restorations effected to the royal tombs, all of which are mainly due to Mr. Scott, and some of which we have before noticed, are the refixing of the iron screens to the monuments of King Edward V. and Queen Eleanor; the restoration to their places of some portions of the tabernacle work to that of Queen Philippa (portions of which had been for many years in a private collection); the restoration to its place of one of the spiral columns to that of King Henry III. which had been broken and removed; and the restoration of a similar column to the shrine of the Confessor: the fragments were found in the triforium, and have been carefully put together, and will shortly be fixed in their place. The recent works have been executed by Mr. Poole, of Westminster.

CHURCH-BUILDING NEWS.

Lincoln.—A stained-glass window in memory of Sir Richard Armstrong, has been added to the three lately placed in the aisle on the south of the nave of Lincoln Cathedral. The artist was Mr. Edgland, of London. The subject, portrayed in four separate groups, is from the life of David, illustrating 1 Sam. xvii. 54, 1 Sam. xx. 41, and 2 Sam. xxiv. 25, surmounted by King David on his throne playing a harp.

Bury.—Excavations are being made for the foundations of the proposed new church, in St. Mary's parish, to be called St. Peter's. The site is in Union-terrace. The style to be adopted in the building is of an early date, and the designs are by Mr. Hakewell. The funds have been placed in the hands of the incumbent of St. Mary's anonymously, and the site has been secured from the Marquis of Bristol.

Rougham.—The *Bury Post* states that the works which have been in progress for some time at Rougham Church are now brought to a close. The roofs have been repaired and made secure, and the interior has undergone a complete renovation — the stonework of the arches, pillars, windows, &c. having been divested of coatings of whitewash, cleaned and restored, and the walls restuccoed. The nave and aisles are now fitted up with oak benches, having carved poppy-heads and tracery panelled ends, varied in detail, corresponding with the old benches, which have been repaired and cleaned. All are in style of the Perpendicular period. The tower (the arch of which has been thrown open to the nave), is fitted up with oak benches, the gift of Miss Colvile, for the school children. Various other minor improvements have been effected. The works have been carried out under the direction of Mr. Johnson, of Bury, architect, by Mr. Rednall, jun. of Woolpit, the contractor. The total expense is about 800*l.*

West-Ham.—The works at the cemetery for West Ham parish, will shortly commence, the contracts for the erection of the chapels and other buildings having been entered into by the West Ham Burial Board, pursuant to the Burial Board Acts. The land is situate in Forest-gate-lane, contiguous to the Whitechapel Industrial Schools, and about equidistant from Church-street, Stratford, and Plaistow wards.

Basingstoke. — At a meeting of the local Burial Board, held on Monday in last week, it was resolved, says the *Reading Mercury*, that Messrs. Poulton and Woodman, of Reading, who obtained the first premium for the designs for the cemetery, should be appointed the architects for the requisite buildings, and that advertisements for contracts should be inserted in the *Builder*, and the various local papers. At same meeting it was also resolved that a loan of 3,500*l.* be negotiated on the rates and borough fund. Mr. Grainger, inspector of burial grounds, has seen and approved of the site for the burial ground.

Oxford.—The tower of St. Mary's Church, which some time ago was considered to be in an insecure state, by the giving way of the lower part, has been strengthened, under the direction of Mr. Scott, the architect, by the insertion of a number of iron bolts, about twenty-four of which pass through the building, and are fastened by ornamental nuts on the opposite side. The buttresses are also secured by bolts, which are fastened in the interior of the church, and the general stability of the spire is increased by the building up with solid work two staircases on each side. The number of bolts altogether is about sixty.

Whitchurch.—The parish church of Whitchurch, Oxon, is now found to be unequal in accommodation to the wants of the parishioners, and it is proposed to build a new aisle, and arrange the seats in the body of the church for the better accommodation of the congregation. Between 1,400*l.* and 1,500*l.* will be required.

Luton.—The foundation-stone of a new church has been laid at Luton by Mrs. Crawley. The site of the new edifice, which is to be named Christ Church, is on the right of the Dunstable-road, about midway between the Town-hall and the point where the Luton, Dunstable, and Welwyn Railway will cross the main road. The church, which will stand east and west, is to be built in the style of the transition from the Early English to the Geometrical period; and will consist of a nave, north aisle, north and south transepts, and chancel, with small vestry attached. The church will be built of red bricks with bands and crosses of black vitrified bricks, and Bath stone dressings from the Corsham Down quarries: the quoins will be in white bricks from the Arlsey grounds: the roof will be covered with Bangor countess slates, laid in alternate rows of blue and green. At the south-west angle of the nave there will be a small turret springing out of the buttresses, with trefoil-headed arches and small shafts, supporting a shingle spire. A cross will surmount the west end of the nave. There will be three entrances to the church, the principal at the west end, and two on the south side. At the west end there will be a large five-light trefoil-headed window: on the south side the windows will be two-light, with polygonal perforations above. The transepts and chancel will have single-light trefoil-headed windows, with rose windows in the gables; and the aisles and sides of the transepts, polygonal cusp windows. The chancel window will be in stained glass. The chancel will be divided from the nave by an acutely pointed arch, springing from ornamented carved corbels; and under the wall-plate of the chancel roof there will be a course of Minton's encaustic tiles. The nave will be divided into four bays, with pointed arches, springing from octagonal shafts. The interior roof will be composed of rafters, with cross braces, springing from and covered with boarding, laid diagonally, and stained and varnished. The chancel roof will be composed of rafters and moulded purlins, with lath and plaster between the rafters, coloured a deep blue. The font and pulpit will be executed in Caen stone. There will be stalls of an ornamental character in the chancel; and the seats, which are to be open, will be of deal, stained and varnished, with ornamental bench-ends of quatrefoil panels. The church will seat 700 persons, inclusive of 100 children; and the estimated cost of its construction is 1,750*l.* It will be heated with hot water by the apparatus of Mr. Scott, of Greenwich. The architect is Mr. H. Elliott, of Dunstable; and the builder, Mr. Robert Greig, of Pimlico.

Portswood and Highfield.—The *Hampshire Independent* states that the addition which has been made to Christ Church, Portswood, by Mr. Chinnock, builder, under the superintendence of Mr. Elliott, architect, was opened on Monday before last for divine worship. This enlargement will afford 300 additional sittings, more than half of which are appropriated for the poor of this rapidly-increasing district.

Winchester.—The tower of St. Thomas's Church here is nearly up to the point at which the spire commences. The new windows of the tower give a different character to the building.

Sherborne.—A vestry was held at the town-hall, on Thursday in last week, to consider the propriety of reopening the west door of the abbey church of St. Mary. When this church was partly under restoration, some five years since, it was thought advisable by the architect, Mr. Carpenter, to close these doors, which was accordingly done, leaving a blank wall as the result. Mr. Slater, the present architect, said, in reply to an inquiry, he thought it would be most desirable that the west door should be opened as a western entrance. Some alterations required would probably cost about 25*l.* exclusive of the masonry work, which would cost about the same amount. It was resolved that the west door of the church be reopened, at a cost not exceeding 60*l.*

Knaresborough.—The consecration of Trinity Church, Knaresborough, took place on Monday in last week. The first stone of the new edifice was laid on the 8th of August, 1854. The church is built on the south-west side of Windsor-lane, on a plot of land given by Sir Charles Slingsby. It is calculated to accommodate 800 persons.

Bristol.—A painted window, in the Early English style, has just been placed in St. Peter's Church, by Mr. Pearce, of Stoke's-croft. St. Peter's has been lighted by gas by Messrs. Hale and Co. of this city.

Oswestry.—The celebration of the completion of the new church tower, Llanyblodwel, took place on Thursday in week before last, when the Gothic tower and spire were completed. This structure is the gift of the Rev. J. Parker, the vicar. The design was from the same gentleman. The church needs repewing.

Llanedwen (Anglesey).—The old church in the chapelry of Llanedwen having become so dilapidated that it was unfit for the celebration of Divine service, and not worth restoring, a new edifice has been erected on the same site, from designs by Mr. H. Kennedy, of Bangor, architect; Mr. Ebenezer Thomas, Menai-bridge, being the contractor. It is built in the Perpendicular style, and consists simply of a nave and chancel, with roof of open frame timber work, the old oak principals being restored. The seats are all free, and calculated to accommodate from 200 to 300 persons. The materials used consist of blue rubble stone, Stourton-hill stone being used for the dressings of the doors, windows, and buttresses, and also of the spire. The church is situated on a gently rising ground, at a short distance from the shore, facing Port Dinorwic. There are two memorial windows of stained glass, to members of the Plas Coch family, one being in the chancel, and consisting of three lights; the other on the north side of the pulpit, which, with the reading-desk, is of oak, and foliated. The cost has been principally borne by the landed proprietors of the parish.

Llandudno.—Divine service was celebrated on Sunday evening at the ancient church of St. Tudno, on the Great Orme's Head, lately restored for Mr. Reece.

Nottingham.—A new Congregational church for the parish of Sneinton, at Nottingham, was opened on Thursday before last. It is built after a plan by Mr. Thomas Oliver, jun. of Sunderland, architect.

Doncaster.—At the beginning of the year, says the local *Gazette*, we stated that it was the intention of Mrs. Saunders, of Hall-gate, to place a memorial window in the west end of the south aisle of the parish church, to the memory of the Elston and Saunders families; and that the design had been entrusted to Mons. Capronnier, Rue de Brabant, Brussels. Since then we find that this benevolent lady has expressed a wish to have the window facing the north aisle also filled with stained glass, and in perfect keeping with the one already mentioned. The principal figures will represent Charity in all her attributes. Mr. Wailes, of Newcastle, has been entrusted with the design for the windows intended for Forman's chapel. The drawings will be specially provided for him, under the direction of an artist, and approved of by Mr. Forman and Mr. Scott.

Huddersfield.—On Thursday in last week St. Paul's Church, Huddersfield, was reopened. About 300 guineas have been expended in renewing the floor, which was very much decayed, and in rearranging the pews.

South Stockton.—A subscription has been commenced for the purpose of building a church

in South Stockton. A site has been offered gratuitously, and it is hoped means will soon be found to raise the building.

Scarborough.—Several alterations and improvements have lately been made in the parish church of Scalby, part of the church having been taken down and rebuilt, and the interior repaired. At the eastern end of the chancel is a window of stained glass, containing three lights, representing respectively figures of "The Baptism," "The Last Supper," and "The Crucifixion of Christ." This window is the gift of Mrs. Betsey Hardcastle, of Scalby Villa, in memory of her deceased husband. These improvements have been carried out under the direction of Mr. Petch, of Scarborough, architect. Other alterations of a more extensive character are contemplated.

Glasgow. — Claremont church, erected at the West End by members of the United Presbyterian body in this city, was recently opened for public worship. The church consists of nave and aisles with clerestory measuring 100 feet from north to south, and 70 feet from east to west, with its west front to Claremont-street, and the north or entrance front to the New Park. The windows of the aisles are gabled into the roof, and divided by mullions into three lights or bays branching into flowing tracery in the pointed tops. On the east and west sides are doorways with segment-headed arches, moulded and enriched with detached flowers in the mouldings leading to the staircases and main porch. The south gable fronting the mews lane is filled in with two-light windows and traceried heads, and the five-light window of the nave, with symbolic tracery. The north, or grand entrance, fronting the park, has a doorway flanked with triple buttresses running into octagonal pinnacles. Over the door is a four-light window inferior to that at the south end, and there are two-light windows at the end of the aisles filled in with tracery and traceried panels at the foot of all these windows. The door is yet to be covered with floriated iron work. The pewing is all of simple design, cushioned with crimson-covered hair-cushions. Something like 20 per cent. more space is allowed for each sitter than generally allowed in Scotland. The gallery is carried round the two aisles and across the north end of the nave, supported on bronzed pillars, disengaged from the pillars of the arcade. The panels of the front are filled in with traceried work. The church is seated for 1,180; but, had the pews been the usual width, it would have accommodated 1,400. Underneath the church is a hall, to accommodate 400 Sunday scholars, or prayer meetings, lectures, &c.; besides a session-house, with the church-officer's apartments, heating-chambers, vaults, closets, lavatories, &c. The building is enclosed with a railing of ecclesiastical design. The entire cost of the building, exclusive of the land, and including the stained windows, cushions, gas-fittings, &c. is considerably under 7,000*l.* The mason work has been executed by Mr. Allan Craig; the wright work by Mr. James Russell; the plumber work by Messrs. Leadbetter and Son; the plaster work by Mr. John Craig; the slater work by Mr. Anderson, Greenock; the painter work by Mr. Graham, of Stirling; the glazier work by Mr. Watson, of Dunfermline; the painted windows by Mr. Ballantyne, of Edinburgh, and Mr. Cairney, of Glasgow; the stone-carving by Mr. James Crawford; the upholstery by Mr. Goldie. The architects are Messrs. Hay, of Liverpool.

FOREIGN INTELLIGENCE.

Kaulbach and the German Museum. — The ancient mural paintings lately discovered in the Town-hall of Nuremberg, have been now cleaned and copied in their natural size, by M. Eberlim, who has already completed those of the inside of the hall and the outer wall of the pediment. This has been done at the expense of the German Museum, and the fine group of musicians has been lithographed for being painted, and privately distributed, with an explanatory text, amongst friends and patrons. Although Nuremberg has possessed many great painters, it is not rich in mural paintings. The more pleasing is it to hear that Kaulbach has offered to adorn one of the walls of the *Kaethause* with a mural painting, and there is, no doubt, that such an example will be followed by many other artists of distinction.

Potable Water. — M. Darcy, of Dijon, has published a work, entitled "Les Fontaines Publiques" (the public fountains of the city of Dijon), which discusses the important question of *drink* water in large towns. It is so far back as the earlier days of Arago and Brougham that the great sanitary importance of potable water for large cities was recognised. M. Darcy has repeated these assertions, and has, moreover, furnished a monography of all the *public fountains* and the various borings and aqueducts of Dijon, which shows what strenuous exertions are made even by small communities for the welfare of their citizens.

The amount of gold exported from Australia, since its first finding in 1851, has been 46,000,000*l.* sterling, of which seven millions have been from New South Wales, and thirty-nine millions from Victoria. It appears, farther, that the amount of gold found in Victoria has been nearly the same during the last four years, but has considerably decreased of late in New South Wales.

The Salubrification of Paris on a new System, &c. (*Paris*, 1856, 8*vo.*)—Notwithstanding the great efforts made for the salubrity of Paris, still no one can pass even the best quarters in the evening hours, during the warm season, without finding himself unpleasantly affected by the smell emanating from the *égouts* of the paving. In Paris, it seems, all the waste water of the households has to take its course in the streets, &c. Thence M. Allain proposes that it should be carried off at once to the greatest depth possible. Now already two large sewers, built on both banks of the Seine, receive those impurities which formerly polluted the waters of the river. The owners of the new streets of Rivoli and Strasburg are bound to have both an ample supply of water and a subterraneous drainage.

Benevento: the Triumphal Arch of Trajan.—The Papal Government have purchased the houses which have been plastered up at both sides of Trajan's Arch, in order to demolish them. The fine basso-relievos, which seem well preserved, will, therefore, come to light, after centuries of concealment. As there will be a place opened around the arch, it will assume the appearance it had in the Roman period. It is time now that this splendid monument should be properly designed, as there exists no good engraving of it. There is at Benevento also the church of Sta. Sophia, a diminutive specimen of its great prototype. It was executed by a Greek architect under Gisulph III. a Longobard king of Benevento. It will next claim the restorative care of the Papal authorities.

THE TUMULI AT KERTCH, IN THE CRIMEA.

Dr. Duncan Macpherson in his paper read at Cheltenham, illustrative of his researches in the Crimea, said,—The present town of Kertch is built close to the site where 500 years before Christ the Milesians, who were of the family of Ionians, formed a colony and founded the city of Panticapæum. The colony of Cherson, near Inkermann, was founded about the same period by the Dorians, a people at rivalry with those of the colony of Miletus. History records that the race denominated the Cimmerians originally inhabited this locality, and that the Tauri, a savage and cruel people, who made offerings and feasts of human victims, and whose dwellings cut out of the solid rock are still seen around Kertch, succeeded them. The Scythians who appear to have descended from the mountains of Thibet in Tartary, and were probably the ancestors of the present race of Tartars, conquered the Tauri, and became the Tauro-Scythians. Crossing from Pontus, where they held sway, the Milesians expelled the Scythians and founded a kingdom, which, from the salubrity of its climate, the fertility of its soil, and the industrious habits of the colonists, speedily arose in its prosperity and became, in its palmiest days, the granary of Athens. They dedicated their new city to the sylvan god Pan: because of the abundance of the wine found, the worship of Bacchus became very general among them, and they called the chief city of this colony Panticapæum. The characteristic features around Kertch are the immense tumuli, or artificial mounds, that abound in this locality, more especially in the second valium. These sepulchres of the ancient world are found in many places. They are in the form of barrows in England, and cairns in Scotland. Calculated as they are for almost endless duration, they present the simplest and sublimest monuments that could have been raised over the dead. The size and grandeur of the tumuli found in the neighbourhood of Kertch excite astonishing ideas of the wealth and power of the people by whom they were erected, for the labour must have been prodigious and the expenditure enormous. Specimens of the highest Hellenic art have been discovered in these tumuli, such as sculptures, metal, alabaster, Etruscan vases, glass vessels remarkable for their lightness, carved ivory, coins peculiarly pleasing on account of their sharpness and finish, and trinkets executed with a skill that would vie with that of our best workmen. All originals were forwarded to the Hermitage at St. Petersburgh, duplicates being preserved in the Museum at Kertch, and these might have been easily secured to England on the investment of the place by the Allies, but, with the exception of some bas-reliefs which, in connection with two other officers, Dr. Macpherson transmitted to the British Museum, the whole of these rare treasures were barbarously made away with. The local tradition is, that these tumuli were raised over the remains and were intended to perpetuate the memory of the kings or rulers who held sway over the colonists, and that the earth was heaped upon them annually on the anniversary of the prince's birth, and for a period of years corresponding to those in which its tenant had held rank or reigned; and to this day the successive layers of earth which were laid on each succeeding year can be traced, a thin coating of sea-shell or charcoal having been first put down. Dr. Macpherson counted as many as thirty layers in a scarp made in one of these mounds about two-thirds from its base. They are to be seen of all sizes, varying from 10 to 300 feet in circumference, and in height from 5 feet to 150, and are usually composed of surface soil and rubble masonry. Herodotus's reference to these sepulchres is the earliest account which history has recorded of this mode of burial, and the attention of the meeting was particularly drawn to his description of the mode adopted to perpetuate the memory of their deceased princes, as it would be seen that one of the excavations to be referred to corresponded exactly with the description given by him. "The tombs of the Scythian kings," he states, "are seen in the land of Sberri, at the extreme point to which the Borysthenes is navigable. Here, in the event of a king's decease, after embalming the body they convey it to some neighbouring Scythian nation. The people receive the royal corpse and convey it to another province of his dominions, and when they have conveyed it through all the provinces, they dig a deep square foss, and place the body in the grave on a bed of grass. In the vacant space around the body in the fosse they now lay one of the king's concubines, whom they strangle for the purpose, his cupbearer, his cook, his groom, his page, his messenger, fifty of his slaves, some horses, and samples of all his things. Having so done, all fall to work throwing up an immense mound, striving and vieing with one another who shall do the most." The Greeks, who always respected the religion of the countries they had conquered, and who, in process of time, imbibed to a certain extent their customs and observances, appear to have adopted this Scythian mode of burial. Instead, however, of placing their magistrates or rulers in "a deep, square fosse," dug in the earth, they built tombs, and over these raised the conical hill. All, or nearly all, of these tumuli have been examined. The Genoese explored the largest and most valuable, and the Russian Government have also carried on explorations with much success. Selecting those which promised best, assisted by Major Crease, Royal Engineers, Dr. Macpherson carefully explored these tumuli. In some the tomb was found above the natural surface, and in some beneath it. Some were arched in the Egyptian, others in the modern style. Square flags, resting on each other in the centre, and supported by a niche in the side wall, supported a few: others had flat roofs, while occasionally no masonry was discovered. Fragments of bracelets, which were exhibited in the room, were found in one of the tumuli. Having descended many feet under the natural surface, he came upon the bed of ashes. The bones of a horse, a human skeleton, and other remains were also met with; and on removing the masonry, fibulæ and bronze coins were picked up in niches between the stones. Having worked at this tumuli for two months without success, he turned his attention to Mons Mithridates. The whole of this hill, from its base to its summit, and the spur extending from it to a distance of three miles, is composed of broken pottery and *débris* of every description to a depth of from 10 feet to 100 feet over the natural clay hill. The height and size of this Milesian work are so enormous, that it is scarcely possible to believe it to be the result of

human labour; and it must have been the work of ages to have conveyed the surface soil from the plains below, to raise it and the neighbouring heights to the present elevation. On the top of this hill is a rude chair, cut out of the rock, and a hollow resembling a sacrificial altar.

INTERDICTION OF PORTICOES IN LONDON.

THE BOARD OF WORKS.

As the architect of works now in progress at No. 30, Grosvenor-street, I consider it my duty to ask you to direct the attention of the profession to the proceedings of the Metropolitan Board of Works, on their last meeting at Guildhall, as reported in the *Daily News* on the 16th inst. and the *Observer* on the 17th inst.

A portico was wished for by the owner of the residence referred to, and after a delay of upwards of three months (arising from a portion of the property being held in trust), the *written consent* of the adjoining owners was obtained, in accordance with the printed instructions of the Metropolitan Board of Works. The design received the approval and recommendation of their superintending architect, and the district surveyor sanctioned its being erected; but the Board of Works decided, by a small majority, against its being erected, not from any objection to the design or mode of construction, but partly on "sanitary grounds," arguing that porticoes are an obstruction to light and air, and partly because the District Board of St. George's, Hanover-square, had objected to them. I find that so far from the Metropolitan Building Act interdicting the erection of porticoes, the 26th section shows that the continuance of such erections for the future was contemplated and expected by the framers of the Act. If, without consulting the public or the profession, this decision of the Metropolitan Board of Works, that for sanitary (!) improvement, porticoes hereafter must not be built in London, is to become the law, I, of course, must submit to this decision. If it were simply a question as to site, I might respectfully urge that few situations in London are more appropriate.

Independently of architectural effect, a portico in a climate like ours becomes a most useful addition to a dwelling, and also it frequently affords shelter to the public. It appears to me that the question whether we are to have porticoes or not in London should be at once definitely settled: it is one of great importance to the architects of London, and I think it is incumbent upon them to take some steps towards remedying what appears likely to become a great evil; for, in the exercise of their profession, they may be induced to comply with the instructions issued by the Metropolitan Board to prepare, as I have done, a block plan of the neighbourhood, showing the various projections in the immediate locality; to make drawings, and obtain the consent of the adjoining owners; pay professional fees for reporting thereon; and probably, as in my case, solicitors' charges also; and after taking every possible pains to comply with the conditions required under the 26th section of the Building Act, and sec. 143 of the Metropolis Local Management Act, be afterwards informed, "We do not object to your design, but to porticoes."

I enclose a tracing from my drawing for the proposed portico, in order that you may judge how far it would have interfered with light and air. The materials were to have been Portland stone, with polished Aberdeen granite shafts, and it would have been much smaller and lighter than any other in the street. JOHN DWYER.

MANUFACTURE OF BRICKS.

Blue Bricks.—In the article on the manufacture of bricks in your last number, the blue or dark-coloured bricks of the Birmingham district are mentioned as being made by exposure to a greater heat than that requisite for burning red bricks, and it is added, that "the iron, melting at a lower temperature than is sufficient to destroy the bricks, gives the outer surface of them a complete metallic coating." I have been told by workmen employed in the manufacture, that when a well-shaped brick is required for outside work, it is usual to produce this metallic coating by throwing salt on the fire the last time fuel is put on before closing the fire-holes. The reason given is, that as the temperature at which the iron melts is but little below that sufficient to destroy the brick, if the blue colour is obtained by simple heat the greater part of the bricks are sure to be more or less misshapen. In Shropshire, I am told the same effect is produced by sprinkling powdered ironstone over the brick before burning. I would trouble you to inquire if the above statements are correct, as I have found it very difficult to obtain information on this subject, my experience in brick-making having been limited to making the common red brick on a farm near here. In one case, the man who undertook the burning offered to produce blue brick if I would supply the salt, but I did not like to run the risk of spoiling a kilnful, without knowing more about the subject; and I have found the blue brick-makers very uncommunicative. S. P.

Iron, Bricks, Pipes, and Tiles.—As you are now noticing Mr. Chamberlain's paper on the manufacture of bricks, allow me to refer your readers to my correspondence last year on this subject, showing the capability of not only making one fire produce from clay, direct from the pit, in less than two hours, a perfect and finished article (except the annealing or gradually cooling) of any form or shape, avoiding all the difficulties of drying and burning out of form, to which all other processes are liable; and as the waste heat of the furnace is not required, it may be applied for generating steam, drying, and burning common bricks, lime, cement, &c.; and as I perceive by the supplement to the *Mining Journal* of last week that Mr. Bessemer's improvements in the iron manufacture are calculated to dispense with the puddling of iron, I would suggest the employment of the puddlers and their furnaces in the manufacture of iron and clay slags, and thereby retain the use of the waste heat for generating steam for rolling the iron, tempering, moulding, drying, and burning common bricks, pipes, tiles, &c. As slag direct from the furnace is moulded into any form or shape, similar to glass, in less than two minutes, and the iron moulds ready for use again immediately, the article is taken out and placed in the oven to anneal. By this simple process all the difficulties of tempering, moulding, drying, and burning, as appear by the paper above referred to, are overcome, either upon a large or small scale, as the melting process is applicable to both in every locality, and more particularly to situations remote from an established brickyard, where a quantity of bricks are wanted at a short notice for a special purpose only, such as the building of a bridge or tunnel, and where the carriage would exceed the cost of the articles manufactured on the spot, from earth required to be removed for foundations, as, with the assistance of moveable machinery to temper and mould common bricks, the clamping system might be adopted for burning where it would not answer to build permanent kilns.

W. G. ELLIOTT.

TOWER-HILL AND ITS NEIGHBOURHOOD.

I WISH you could spare time to visit Tower-street, and also Postern-row, Tower-hill, for the purpose of looking at the tinkering going on in both places. At the corner of Mark-lane a ricketty old house is not to be pulled down because the public service requires that some 50 or 60 square feet should be added to the inconveniently narrow footway. But this is nothing to the Woods and Forest Commissioners' proceedings at Postern-row, where some real improvement is so much needed that several Acts of Parliament have been passed to effect it, and it was the first on the list of thoroughfares which the Commissioners for Metropolitan Improvements gave as imperatively required. Ten years ago that might have been done for a few hundred pounds, which will now cost as many thousands, owing to mismanagement or supineness. So absolutely necessary was something required to be done, that the City authorities have stepped beyond their jurisdiction to make the roadway at least passable. Whom the footway round the Tower belongs to, I do not know, but it is in a state too disgraceful for even the field-marshal, who rules in the neighbouring fortress, to be supposed capable of approving. X. Y.

RAILWAY MATTERS.

Sleepers.—Some experiments have recently been made by the Permanent Way Company at Westminster, showing the operation of Dr. Boucherie's patent process for preserving timber sleepers from decay. The object of the process is first to expel the sap, and then fill the pores of the timber with a preservative solution. The apparatus is very simple, and the cost of the whole, it is said, need not exceed 50*l*. It consists of a slate tank, containing a solution of sulphate of copper, placed at an elevation of about 32 feet from the ground. Flexible tubes convey the solution to the timber intended to be preserved. A cap is fitted to one end of the piece of timber, and the flexible tube conveys the solution to it. The pressure from above forces the sap gradually out of the other end of the timber, and as that is accomplished the solution follows the sap, takes its place, and the operation is comp'eted. It appears from official statements that this process has been applied with success on the Northern of France Railway, where upwards of 80,000 beech and birch sleepers so prepared and laid in 1846, were found, in 1856, to be as sound as when first laid down. It also appears that about 230,000 telegraphic posts in France have been successfully treated by the same process. The great object appears to be, to apply the process to cheap wood, such as Scotch fir, beech, elm, and other timber, immediately after the tree has been cut down, with a view to make it available in place of more expensive timber.

New Station at Chippenham.—A new station is to be built at Chippenham for the Great Western Railway Company. It will be a covered structure 140 feet long, having a covered platform of 400 feet, with spacious offices and commodious waiting-room suitable for the increasing traffic there. The present goods station will also be taken down and a larger one erected a short distance up the line. The contract for the new works has been taken by Mr. Brotherhood, who has already commenced clearing the ground.

New Route to India.—The paper on a Syro-Arabian Railway, contributed to the geographical section of the British Association by Mr. Locke, suggested a line of railway from Acre to Busrah, passing the Jordan between the 32nd and 33rd degrees of latitude, to be continued from Busrah along the southern shore of the Persian Gulf, and crossing the northern spur of the Arabian peninsula by Bireimah to Sohar, to proceed coastwise to Maskat, and thence to Bombay. The gain *in space* of this line over the proposed Euphratean routes was stated to be 400 miles; and *in time* (making due allowance for greater velocity of locomotive than steamer), two days and a half, and, over the present overland route, 1,000 miles, or six days, which might be increased one day and a half by accelerating the speed in the long level reaches of the desert, where the traveller can observe, at the distance of several miles, any object of a size calculated to impede or endanger a train.

AUSTRALIAN NEWS.

THE Melbourne Market Committee had approved of the plans of the proposed new Eastern Market on 1st April. The plans are from the design of Mr. M. P. Smith, the city surveyor. The dimensions of the market are, as compared with any public edifice that has yet been erected in Melbourne, gigantic. The extent of the front exceeds, by nearly 100 feet, that of the Western Market—the latter having only 232 feet frontage, while the proposed Eastern Market will have 330 feet. The sides are to extend 313 feet, the whole forming a quadrangle. The frontages will abut on Bourke-street, Stephen-street, Little Collins-street, and a new street to be formed at the western extremity, from Bourke-street to Little Collins-street. The style of the chief buildings will be Italian. The estimate of cost will be nearly 40,000*l*. The income anticipated from rents is 9,500*l*. a year.

The several classes of mechanics and workmen at Melbourne have been holding meetings to obtain a general combination for restricting the time of labour to eight hours per day, which they contend is quite as much as ten hours in the mother country, considering the difference of climate. All the meetings of the different trades had been unanimous on this question up to the last despatches.

The executive at Melbourne had accepted a tender from Messrs. Holmes and Co. for the construction of 3¼ miles of plank road, at a short distance from town. The amount of the contract is 16,900*l*. being at the rate of nearly 5,000*l*. per mile. The Government have also accepted tenders for the erection of mile-posts upon the roads in the vicinity of Melbourne.

The following appointments in connection with the Victorial railway department had been made by the Acting-Governor:—To be Engineer-in-Chief and Surveyor, Mr. George Christian Derbyshire, C.E.: to be Engineers and Surveyors, Mr. Charles R. Sayer, C.E.; Mr. Robert Watson, C.E.; Mr. William B. Hull, C.E.; Mr. William A. Zeal, C.E.; Mr. William H. Greene, C.E.; Mr. William F. Hardie, C.E.; Mr. Frederick C. Christy, C.E.; to be Draughtsmen, Mr. Robert Adams, C.E. and Messrs. William E. Bryson, Adam A. Jackson, and Samuel W. Kemp.

The *Australian Builder*, speaking of colonial resources, says:—Some time since, Captain Pasley, the Commissioner of Public Works, published a general invitation soliciting samples of all kinds of building materials indigenous to the colony. This very commendable act has not been disregarded, many intelligent persons having been induced to turn their attention to the discovery of new and the improvement of existing materials. We have inspected several samples of fine granite from the Plenty, Mount Gellibrand (Broadmeadows), and Western Port, and a very beautiful specimen of porphyry, which is said to abound on Gabo Island. We have also seen some samples of blue lias cement, now being tested by Mr. Knight, the resident architect at the Houses of Parliament, and so far as the trial has gone the material appears to be of a very superior quality. Mr. Knight has also manufactured a small quantity of plaster

from colonial gypsum, but the sample forwarded to him was insufficient to make a fair experiment. The manufacture of bricks has also been wonderfully improved. A new kind of prepared brick, made by steam power, has just been turned out from an establishment on the Salt-water River, superior to anything ever made or even imported into the colony. In addition to the uniform squareness and beauty of these bricks, they are found to be perfectly fireproof, and fully equal to the celebrated Stourbridge clay.

In the department of Public Works, at Adelaide, according to the *Adelaide Observer*, of May last, "the committee advised no specific retrenchment of expenditure, but counselled general reforms in the service: the Government have, however, greatly reduced this item: instead of 600*l.* for occasional overseers of works, they have put down 100*l.*; on forage 50*l.* are saved: the salary of the colonial architect is now entered at 393*l.* instead of 600*l.*; and the salary of the assistant colonial architect at 300*l.* instead of 400*l.*: a draughtsman at 208*l.* disappears, and sundry reductions are made in clerks' salaries."

The new Congregational Chapel recently erected at the junction of the Norwood and Kensington townships, according to the same paper, was opened in April. The chapel stands at the end of the Norwood-parade, its principal front facing westward, and forming a conspicuous object along the Parade. The windows are filled in with stained glass. The interior fittings consist of open pews in cedar, with Gothic panels. The architect was Mr. George Abbott, of Adelaide; the builder, Mr. Samuel Lewis, of Kensington. The chapel, including all expenses, cost 2,196*l.* 14s. 6d.

BATS IN CHURCHES.

I see by your paper of the 26th April, a churchwarden wishes to know how to rid his church roof of bats,—animals which abound in this country, and in some places are a great nuisance. The method adopted here, and which is most effectual, never failing to drive them from the house, is to tie portions of the prickly pear (a species of cactus growing wild here, and of which they make hedges), on a string across the room, or even on the bottom of the punkah (it is my misfortune to be in a country where such things are required). The bats, in their blindness, fly against the spines, half an inch long, and suffer so severely, that they soon desert the house where this expedient is tried. The prickly pear could, I feel sure, be obtained in many places in England.

Rajahmundry District, Madras Presidency. INDICUS.

Notices of Books.

Aphorisms on Drawing. By the Rev. S. C. Malan, M.A. Vicar of Broad-Windsor. London: Longman and Co. 1856.

This nice-looking little volume, inscribed with propriety to Mr. J. D. Harding, contains some useful remarks, in short sentences. There would seem to be, however, in the rev. author's mind, some confusion as to the meaning and the aim of drawing. He says, "Drawing is human art, in *imitation* of nature." We need scarcely give any reason for saying that it is nothing of the kind. It may represent, but never seeks to imitate. The author considers drawing in a two-fold aspect, "as *positive*, or *real*, and as only *relative*;" and proceeds to define real drawing as "an image of God's works," and relative drawing as "an imitation of man's work." Drawing is the art of justly representing the appearances of objects by a certain process, and a view of the summer-house we have set up in our garden may be as fully real drawing as the representation of the everlasting hills which form the back-ground. Harm is done, as it seems to us, by seeking to invest a necessary and easily acquired power, which all ought to possess, with higher attributes than belong to it; and we do not think it necessary, therefore, to believe with the author that the idea of *devotion* "of right belongs to drawing" (any more than to every act of our lives), "since drawing is an image of God's fairest works." We deny altogether that no one can ever learn drawing unless naturally qualified for it by a combination of gifts, and protest against the doctrine, that "it is of no great use to teach children to draw before the age of fifteen or sixteen." All can learn to draw, and the earlier they begin, the greater will be the power they will acquire over the pencil.

VARIORUM.

The twelfth edition of "Black's Picturesque Tourist of Scotland" (C. and A. Black, Edinburgh) has been issued. A twelfth edition speaks for itself, and all we need say is that it abounds with illustrations, and forms an excellent guide to tourists in Scotland.——The fourth and concluding treatise of Messrs. Walton and Maberly's scientific series, by Dr. Lardner, titled the "Handbook of Natural Philosophy," is now published. It treats of electricity, magnetism, and acoustics, and completes a new edition of a very valuable and standard work. Many hundreds of engravings have been added to those of the previous edition, already numerous.——"An Introductory Lecture on Education, being the first of a series of plain and simple Lectures on the Education of Man," by Thomas Hopley, F.S.S. author of "A Lecture on Respiration," favourably noticed by us some time since, has been published by Churchill, of New Burlington-street. This is one (and the first) of a series written with a view to delivery in London for behoof of the funds of various charitable institutions. The training of the faculties and organs in general during childhood is treated of in this introductory lecture, and the views appear to be in general harmony with those of a sterling treatise by Dr. Andrew Combe on a similar subject.——Relfe, Brothers, of Aldersgate-street, have published "A Complete Guide to Government Appointments, and to the Civil Service Examinations," by J. C. Hurst, of Her Majesty's Civil Service. Besides lists of the branches of education requisite in candidates for the various Government offices, it contains some curious specimens of the results of past examinations, in defective spelling, and various other information, including an analysis of the Civil Service Commissioners' report, and a general preface.——"The Metropolitan Reformatories and Refuges," published by the committee of the Reformatory Union, 118, Pall-mall, gives an interesting and authentic account of some thirty institutions.——An important lecture on epidemical forms of disease, and the necessity and advantage of pure air and light to healthfulness in towns, on malaria and other poisons (such as lead), and on other sanitary subjects, has been published by Bell and Daldy, under the title of "The Progress of Preventive Medicine and Sanitary Measures." It comprises the Thrustton speech on the Wendy Commemoration, at Caius College, Cambridge, delivered in May last, by A. W. Barclay, M.D. officer of health for St. Luke's, Chelsea.

Miscellanea.

The Hull Glass Company.—This company, which was established and failed at Hull, is about to be completely wound up, after being in Chancery since April, 1850, the date of the order to wind up.

"The Georama."—A company is in course of formation to carry out a patented improvement in pictorial representations, by which, it is asserted, countries, cities, towns, and villages, with their surrounding or connecting scenery, may be impressed upon the imagination of the spectators, or nearly so, as if they were viewing the real objects themselves! "Persons who have visited dioramic exhibitions, similar to those at present in use, are aware that the scenery passes from right to left, or from left to right, in front of the spectator; but by this novel mode of exhibition, the scenery will pass sideways, or on each side of the spectator—so as to represent, at one and the same time, both sides of any street, road, river, canal, harbour, &c. In other words, the scenery will move from the centre, in front of the spectator, divergingly or obliquely, to either side; and as it thus passes, the spectator will fancy himself in the act of moving forwards, whilst the scenery will appear to be fixed and stationary."

Purify!—Will you allow me to make a brief sanative suggestion through the medium of your columns? In order to counteract the toxical gases abounding in the atmosphere of all large towns, and so productive of phthisis, I beg to propose that large superficies of matter be formed, of such composition as will cause the absorption of such gases. Carbonic acid gas and sulphuretted hydrogen, our two greatest enemies, might be counteracted by the familiar chloride of lime, exposed in sufficient quantity.—O. H. H.

*** We have often said that municipal and other authorities ought to be obliged by law to make large use of such agencies.

Death of Mr. James Bremner, C.E.—Mr. James Bremner, civil engineer and shipbuilder, at Pulteneytown, Wick, retired to bed in his ordinary state of health on Wednesday in week before last, but was suddenly taken ill, and died before twelve o'clock. Mr. Bremner's share in removing the steam-ship *Great Britain* off the strand in Dundrum Bay is well known: the fatigue he then underwent, says the *Scotsman*, tried his iron constitution very much, he having been almost constantly employed night and day for about three months.

Relics discovered at Taunton.—The workmen of Mr. Jeboult, builder, have found in the middle of the wall of a house in Fore-street, Taunton (probably about 250 years old), several specimens of the remains of Ham-hill stonework, supposed to have formed part of the porch of the Portman town residence, which formerly stood near the spot. The pieces appear to have been worked up in the original building, and consist of several carved bosses on the intersection of a groined rib, a carved gurgoyle, stone pattern complete, portions of the jambs of doors and tracery of stone windows. The workmen also discovered about the same time, whilst making alterations in a house in North-street, several sandstone chimney mantels, one of which is richly cut in sunk Gothic tracery, and was found in its original position, but covered with plaster and rubbish; also a moulded oak casement window, taken from the north wall.

Antiquarian Remains at Cardiff.—The workmen employed in constructing the town drainage at Cardiff discovered, last week, the vaulted entrance of a subterraneous passage in that portion of the road which passes along the pine end of the Cardiff Arms Hotel. On opening the aperture, so as to admit ingress, it was ascertained that the passage extended for about 50 feet beneath the pavement, and terminated in a Gothic arch, which had been blocked up with masonry of a later date. The passage appeared to have been ventilated from the roof in two places. These outlets were of a circular shape, lined with masonry, and had been closed at the summit with pieces of timber, still visible, supported by iron bars. The passage crosses the road diagonally from the small window of the Cardiff Arms Hotel towards the Castle Lodge, but it has not been opened more than 73 feet. The arch is roughly but solidly formed of Lockwith limestone, and the sides of river pebbles. The passage is supposed by some to have formed a communication between Cardiff Castle and an ancient mansion, which, in the days of the Commonwealth, stood on the site now occupied by the dead-house, with the view of affording the inmates of the castle an opportunity of escape in those troublesome times. It is also believed that this subterranean passage extends beneath the bed of the river Taff, to another ancient house, which formerly stood on the opposite side. On condition of a large reward being given him, a soldier is recorded to have showed the Protector's army a secret subterranean passage, which communicated with the castle beneath the bed of the river Taff, by means of which the garrison was surprised during the night. Cromwell having obtained the castle, the soldier was very properly hanged as a reward for his treachery.

The Great Bell for Westminster Clock.—This bell has now been raised from the pit, and was sounded for the first time with a clapper of 7 cwt. on Friday last. The casting is said to be clean, and the tone fine. The diameter is 9 feet 5½ inches; the height outside, 7 feet 10½ inches; inside 6 feet 8 inches; thickness of sound bow, 9 inches; of the waist, 3 inches. It has not yet been weighed, but, as it has shrunk less than was expected in casting, it is believed that the weight will be rather over 15 tons. The note is E natural. The bell has the following inscription running round it, just above the sound bow:—"Cast in the 20th year of the reign of her Majesty Queen Victoria, and in the year of our Lord 1856, from the design of Edmund Beckett Denison, Q.C.; Sir Benjamin Hall, baronet, M.P. Chief Commissioner of Works." On the waist or middle of the bell are the Royal arms, and the names of the founders and patentees of the mode of casting which has been adopted for it,—"John Warner and Sons, Crescent Foundry, Cripplegate, London." The certificate of Professor Wheatstone and the Rev. W. Taylor, F.R.S. or one of them, is required in addition to that of Mr. Denison. The quarter bells will now be proceeded with: the largest of them will be 6 feet in diameter, and will weigh about 4 tons, and is also to be cast at Norton, near Stockton-on-Tees.

A Large Gasometer.—A gasometer of enormous size, no less than 200 feet in diameter, is in course of construction for the Imperial Gas Company, near Stanley-bridge, in the King's-road, Chelsea. It comprises about 1,000 tons of iron, and, including the tank, will probably cost more than 20,000*l.* Messrs. Westwood and Wright, of Dudley, are the contractors. The works of the company here are now becoming of immense extent.

Boring and Excavating.—Mr. R. A. Brooman has patented an invention (a communication), which consists of certain arrangements of machinery, driven by steam or other like suitable power, whereby earth, stone, and rock are bored or excavated. The *débris*, or part dug out or excavated, is deposited in waggons, at the side or out of the track of the machine, and whereby the machine is made to propel itself forward; all these actions being simultaneous, and communicated from the same prime mover. Immediately behind the excavating tool a series of hollow funnel-shaped gatherers are fixed upon the shaft, and again behind them a hopper, which by means of slides is made to open to one or both sides, or to the centre of the machine.

Destruction of Ancient Relics in Scotland.—Another interesting antiquity has just been destroyed. The *John O'Groat's Journal* thus speaks of it:—The Dwarfie Stone of Hoy (one of the Orkney isles, if we mistake not) has, we understand, been irretrievably destroyed by the barbarian hands of some visitors to the island, who, to all appearance, maliciously lit a fire within the excavation in the stone, and by that means succeeded in splitting it into fragments. A reward has been offered to any one who may give such information as will lead to their conviction.

Opening of the Grand Belgian Economic Exhibition.—*L'Exposition d'Economie Domestique de Belgique* was opened at Brussels on the 25th inst. under the special patronage of King Leopold, and at the sole expense of the Government. It is held in Les Jardins Botaniques, and under the buildings attached to these grounds. The Minister of the Interior, accompanied by several of his *attachés*, inaugurated the opening. This is an exhibition emphatically for the working classes, and to attract the beholder by the simplicity and economy of the main articles necessary for the comfort and convenience of a family. It is held preliminary to the *Congrès International de Bienfaisance*, which is summoned for the 15th of next month, and which is to consider the most effectual means of improving the condition of the industrious classes throughout the world, and to adopt such measures as may be deemed necessary for the promotion of that view. The objects exhibited are divided into six classes, which are again subdivided into a great number of details. These classes are—1st, Lodgment and Construction; 2nd, Furniture and Household Objects; 3rd, Clothing; 4th Food; 5th, Tools and Implements of Manual Labour; 6th, Education and Instruction. The lowest price is marked upon each article. It is proposed that the exhibition shall remain open until the 1st of October; that the visitors shall be admitted gratuitously from ten to four o'clock each day, on Sundays, Mondays, and Thursdays; and that on the other days of the week they shall be admitted upon payment of half a franc each. A vast number of persons entered the building on the opening day.

A Dublin Athenæum.—A new literary institute, named the Dublin Athenæum, has been formed in Grafton-street, in the southern part of the city. Classes are in process of formation, reading-rooms and conversational galleries have been established, and a library is in course of collection. Lecturers are being engaged, and other arrangements made, for an active opening session.

Mortar in Ancient Buildings.—In corroboration of your statement in the last *Builder*, respecting the durability of mortar in ancient buildings, the following may be a farther illustration. It was only yesterday that I was examining, with an intelligent builder, the sole vestiges remaining of the ancient castle of *Oswestry*. These vestiges comprise two large masses of masonry, each containing several cubic yards, one of which, though completely turned out of its bed, still retains its integral tenacity: the other stands as the builder laid it. They are portions of the keep, and must date nearly as far back as the Conquest, if not anterior to that period. The masonry is of the very rudest kind, and is composed of large and small boulder stones, lumps of red sandstone, and fluts. They appear to me to have been laid dry at first in indiscriminate rubble, and grouted or flushed at intervals with mortar, composed of lime, sand, and pebbles; thus, from the shape of the stones, giving a proportion of nearly one-fourth of mortar to the entire structure. Nor does it appear to me that a hammer has been used even to the face of the wall, which is composed of the same sort of stone, but laid close, and as even as the surface would admit. Notwithstanding * the exposure of this mortar to the atmosphere for ages, in a bleak situation, it will still resist the blow of a hammer as well as stone, and it must have cost some powder and shot, in more senses than one, to bring it to a ruin, such as the wind might reduce some of our modern buildings to.

J. Blake.

* Read "Because of."—Ed.

The Restorations at Christ Church Cathedral, Oxford.—The restorations and alterations at Christ Church Cathedral, which are being effected by Messrs. I. and W. Fisher, of Oxford, builders, from the designs of Mr. John Billing, are progressing rapidly. The architectural features of the edifice, and more especially the groined roof, with its carved pendants, instead of being, as hitherto, in some measure concealed, will be prominently brought out to view. According to the *Oxford Journal*, the present dean, Dr. Liddell, aims at putting Christ Church Cathedral, as far as is practicable, on the same footing as other cathedrals, with regard to the public. The north transept, immediately opposite to the organ, is to be devoted to the public, and is to be fitted up with seats, which will accommodate at least 300 persons. The edifice, being not only a cathedral but a college chapel, it has been found necessary to modify the new arrangements, to suit both these characteristics. During the progress of the work, two sarcophaguses, or stone coffins, have been discovered. One of these was found on the south side of the choir, and the other in a corresponding position, between the second and third columns, on the north side of the choir, and almost on a level with the ground, forming, probably, at one time, a part of the paving, as the lid is richly sculptured with a long cross and other ornaments. On removing the lid, which appeared to be of the twelfth or thirteenth century, all that were found were remains perfectly decomposed, a portion of a shoe, remnants of the burial dress, and one bone—but no skull: in the coffin were also found a pewter chalice and paten. The coffins have been allowed to remain in their original resting-places.

The Wellington Statue at Manchester.—According to the *Manchester Guardian*, upon a pedestal of granite stands the statue of the duke: at each angle of the pedestal is a small projecting foot or pedestal for the reception of a subordinate figure: the two figures at the front angles are (to the spectator's left) Mars or Valour, and (to the right) Minerva or Wisdom. Behind Mars is the reward of valour—Victory: behind Minerva is the reward of wisdom—Peace. In four panels or plinths in the square of the pedestal will be placed as many bas-reliefs, but not in time for the inauguration. That at the rear is to portray the battle of Assaye, Wellington's greatest victory in India; that in front, the battle of Waterloo, his crowning victory in Europe. Between the figures of Mars and Victory is to be a bas-relief of the Congress of Vienna; and between Minerva and Peace another representing the duke receiving the thanks of the House of Commons. The statue and the four subordinate figures are all of bronze. The figures were cast by Messrs. Robinson and Cottam at their Pimlico works, and the aggregate weight of metal in them is about ten tons. The statue of the duke alone weighs five tons, and stands 13 feet high: the granite pedestal is about 19 feet in height, and weighs about 100 tons.

Archæological Excursions.—The annual excursion of the North Oxon Archæological Society was fixed for Thursday and Friday in this week, the 28th and 29th inst. Starting on the first day from Brailes, they were to proceed to Compton Wynyatts, Tysoe, the Sun Rising (where they were to lunch), Warmington, Shotteswell, and back to Banbury, where, in the evening, there was to be a meeting in the Vicarage Hall, Mr. W. Dickins, of Cherrington, in the chair. On Friday the route was to be to Adderbury, Deddington, Somerton, Middleton Stoney, Wendlebury, Weston-on-the-Green, Alchester, and Bicester, at which place the company were to dine. The Worcester Diocesan Architectural Society made, some short time since, a proposal to the Oxfordshire Society to join in this excursion: the offer was accepted, and a larger concourse of strangers than usual was anticipated.

A Model City.—We can imagine a city with no ground floors; with every house upon an elevated foundation; the drainage, the gas and the water supply, carried on through ducts, easily constructed, accessible in every part, and under constant inspection. We can imagine the railway on the same level, noiselessly distributing its hundreds of thousands, regularly throughout the day; the omnibus—lumbering make-shift of a half-civilised community—disappeared; the horse, rude slave of a barbarous unscientific time, preserved only as the slave of the rider for pleasure; a builded esplanade above the railway; above the aqueduct, the drainage and gas ducts, on a level with the lowest floor of the houses; the whole of the underground of life accessible to the inspector and the workman, ventilated, and constructed to assist in maintaining the health of the whole metropolis, instead of being the source of poison. We can imagine trades and callings distributed into classes and districts; the penny railway ride being only a customary portion of the rent. The houses of all classes, palaces; the roofs, emancipated from smoke, garden-terraces; and the view from any elevated tower, a picture of health and beauty, of animated movement without crowding.—*Spectator*.

Statue of Vandyke.—At Brussels during the late *fêtes*, a statue of Vandyke, the work of M. Cuyper, a native architect, was inaugurated.

MESSRS. CLARK and CO.

15, Gate-street, Lincoln's-inn-fields.

Gentlemen, — After eight years' trial of your Patent Revolving Shutters, erected here, I can safely pronounce them most effectual in their action, and they have given me the utmost satisfaction.

I am, Gentlemen, yours truly,

Geo. Downe.

155, Leadenhall-street, August 7th, 1856.

TENDERS

For building school and residence, St. John's, Upper Lewisham. Mr. Joseph Peacock, architect.—

Thompson	£1,416	0	0
Wells	1,380	0	0
Patman and Co.	1,339	0	0
Todd	1,278	0	0
Harmer	1,268	0	0
Peper and Son	1,256	0	0

For an Independent chapel and schools, at Banbury, Oxon:—

Orchard and Co.	£2,589	10	0
Cartidge	2,150	0	0
Chesterman	1,660	0	0
Davis (accepted)	1,397	0	0

For re-building premises in the rear of 134, Fleet-street. Mr. C. H. Howell, architect:—

W. Cubitt and Co.	£4,645	0	0
Brown and Co.	4,542	0	0
T'Anson	4,534	0	0
Lucas, Brothers	4,231	0	0

For the erection of new parsonage-house, at Little Brickhill, near Fenny Stratford, Bucks. Mr. Arthur Billing, architect. Quantities supplied:—

Williams (Luton)	£1,497	0	0
Andrews (Tring)	1,445	0	0
Cooper (Aylesbury)	1,325	0	0
Lawson and Joy (Bedford)	1,325	0	0
Quarterman (Oxford)	1,298	15	0
Chesterman (Banbury)	1,198	0	0

For hotel, to be built at Knightsbridge, for Mr. Martin Wallace. Mr. F. R. Beeston, architect:—

Myers	£7,700	0	0
Cubitt and Co.	7,380	0	0
Lucas and Co.	7,308	0	0
Holland	7,197	0	0
Wilkinson and Son (accepted)	7,189	0	0

For alterations to Mr. White's premises, 68, Cheapside. Messrs. Tress and Chambers, architects. Quantities supplied:—

Brand	£1,498	0	0
Brown (College Hill)	1,437	0	0

William Wills	1,012	991	994	971
Joseph Hayden	920	940	—	—
Benj. Wells (accept.)	880	878	865	853

The terra cotta was specified to be supplied from Mr. Blanchard's Works, Blackfriars-road.

TO CORRESPONDENTS.

"*Taking out Quantities*"—Sir,—As one of your oldest subscribers, I will feel obliged by any of your correspondents replying to the following:—It is usual with many architects to employ building surveyors to take out quantities: can the architect demand a copy of the detail calculations?—S Y.

"E. W. T." publicati on would not be desirable at this moment.—"B. B. B."—"W. P."—"J. G."—"W. G. E."—"Subscriber."—"C. R. S."—"D. G. A."—"C. E."—"W. R."—"Otho."—"F. J. F."—"J. C."—"G. W."—"H. A. H."—"C. Estate."—"G. T. R."—"E. A. S."—"R. B."—"A. B."—"J. C."—"Constant Subscriber."—"J. C. H."—"B. O. B." (under our limit).—"W. D. M."—"F. S."

Erratum. For Duke of Alnwick, p. 464, *ante*, read Duke of Northumberland.

NOTICE.—All communications respecting *advertisements* should be addressed to the "Publisher," and not to the "Editor:" all other communications should be addressed to the Editor, and not to the Publisher.

ADVERTISEMENTS.

A YOUTH WANTED in a BUILDER'S OFFICE, who understands time and book keeping. Must have some knowledge of the business. Apply, with full particulars of age, where last employed, and salary required.—Address, W. A. L. 80, Aldersgate-street.

SURVEYOR of GAS MAINS, and CHIEF INSPECTOR of LIGHTS.—A Metropolitan Gas Company is in want of a Gentleman to fill the above appointment. It is indispensable that he be a good draughtsman, of mechanical abilities, good address, and a thorough man of business. A DISTRICT INSPECTOR is likewise required, who must possess similar qualifications to the above.—Apply by letter only, stating particulars of previous engagements, age, salary expected, and copies of testimonials, to GAS, Wadham's Newspaper Office, 169, Strand.

TO BUILDERS' CLERKS.

WANTED, a BUILDER'S CLERK, of good, practical experience. He must be a good draughtsman, and full competent to take off quantities, make estimates, measure up works, and keep the books of a builder's office.—Reference will be required.—Address, stating age, terms, and where last employed, to DELTA, Post-office, Leicester.

TO FOREMEN JOINERS.

WANTED, a capable MAN to manage the joiners' department of a builder's establishment accustomed to set out the best work for, and superintend, a number of men working piece-work, in connection with machinery. Good references indispensable. Apply, in the first instance, to Mr. ELLIS, 44, Botolph-lane, City.

WANTED, an ASSISTANT in an Architect's Office, thoroughly acquainted with ecclesiastical architecture and land-surveying.—Apply by letter to OMEGA, at Messrs. Aldridge and Street's, Clement's-inn, stating age, terms, references, &c.

WANTED, a DRAUGHTSMAN, thoroughly acquainted with building details, who can work out a finished drawing from a sketch, and who can measure work. He is competent to land and town surveying would be preferred.—Address, stating experience, capabilities, and terms, to C. S. care of Abbott, Brown, and Co. Advertising Agents, 2, Upper Wellington-street, Strand.

WANTED, in a Land-Surveyor's Office in the country, an ASSISTANT, who is fully competent to take a part in surveys in the field, and to make copies of maps in the office. A good reference will be required.—Address, W. B. Post-office, Banbury, Oxfordshire.

TO KILN BURNERS.

WANTED, a MAN who perfectly understands GLAZING and BURNING SANITARY PIPES. Address, Z. Z. Mr. Arnold, 23, Poultry, London.

WANTED, a SHOP FOREMAN of JOINERS, in London.—Apply to Mr. TIBBATTS, 44, Bishopsgate-street Without.

WANTED, for an Indian Railway, a Person well acquainted with rock tunnelling. All such persons experienced in that work, and desirous of proceeding to India, should apply by letter direct to the undersigned, stating age, qualifications, and experience, to Mr. W. G. THORNE, 1, Hare-court, Old Temple, London.

TO BUILDERS' FOREMEN.

WANTED, by a London Firm, a steady, experienced MAN, to take the SUPERINTENDENCE of the ERECTION of a HOUSE at a short distance from town. Address, stating particulars where last engaged, and salary required, to X. X. Office of "The Builder."

TO BUILDERS.

WANTED, by a practical Man, a SITUATION as GENERAL FOREMAN. The country preferred.—Apply, G. C. 68, St. John's-street, Clerkenwell.

TO MASTER BRICKMAKERS, RAILWAY CONTRACTORS, BUILDERS, AND OTHERS.

WANTED, by a respectable Man, a SITUATION as FOREMAN of a BRICKFIELD, who has had twenty years practical knowledge in Making common stocks, and stop brick, and white close kiln brick, tiles, and drain pipes of every description; and well understands making, preparing, and moulding such goods, and all matters connected therewith. Has no family to embrace. Most respectable references can be given.—Address, A. B. J. Bristow, 24, Hanbury-road, Stoke-Newington.

WANTED, an ENGAGEMENT as STAIRCASE HAND, or as SHOP or GENERAL FOREMAN, by an experienced person, having a general knowledge of building, and acquainted with drawing, taking out quantities, and estimating; satisfactory references.—Direct, A. B. 2, Alpha-cottages, Ford-road, Old Ford, Bow.

TO TIMBER MERCHANTS.

WANTED, by the Advertiser, a SITUATION, &c. in which he is well acquainted with the routine of a timber merchant's office, having been engaged for several years in the above capacity at one of the largest houses in London.—Address, F. E. office of "The Builder."

TO ARCHITECTS, ENGINEERS, AND OTHERS.

WANTED, an ENGAGEMENT with an Architect or Engineer as Draughtsman and general Assistant. The advertiser is a first-rate artistic and architectural draughtsman and delineator, and can turn his hand to general engineering or mechanical drawing; and has specimens submitted if required.—Address, X. Y. Z. Post-office, Star-street, Bethnal-green, London.

TO LIME, TILE, BRICK, AND CEMENT MERCHANTS.

WANTED, by a Young Man, aged 26, who has had nine years' experience in the above trades, a SITUATION as BOOK-KEEPER or COLLECTOR. Best testimonials as to ability, integrity, &c. can be given.—Address prepaid, to W. H. 13, Swinton-street, Gray's-inn-road.

TO PAINTERS AND DECORATORS.

WANTED, a SITUATION as GRAINER and WRITER, in a general shop; has a thorough knowledge of house painting. Terms, 30s. per week, constant.—Address, Y. X.—Office of "The Builder."

TO BUILDERS AND OTHERS.

WANTED, a SITUATION as FOREMAN of MASONS and BRICKLAYERS, by a Young Man, who has practical knowledge of the above trades. He can measure work, take out quantities, make working drawings, keep books, &c. and can be well recommended.—Apply to J. B. M. 13, Wale's-square, Kensington-road, Lambeth.—London preferred; the country objected.

TO ARCHITECTS &c.

WANTED, by the Advertiser, a thorough practical Man, aged 40, a SITUATION as HEAD WORKS, who has had extensive practice in the working details of works of magnitude is competent to make fair and working drawings, estimate, take out quantities, and can be highly recommended; has 20 years' reference from the situation he is about to leave.—Address, J. W. M. care of Mr. Argles 17, St. George's-place, Knightsbridge, London.

TO CARPENTERS, &c.

WANTED to APPRENTICE, IN-DOORS, a respectable Youth, aged 14, to a Master Carpenter and Builder in the country, where he will have an opportunity of acquiring a thorough knowledge of his business. A small premium will be given.—Address, post-paid, J. R. O. at the Post-office, Hemel-Hempstead, Herts.

TO CARPENTERS AND JOINERS.

WANTED, by a Young Man who has served his time in London to the above trade, a PERMANENT SITUATION. Moderate wages only required.—Address, P. W. Charterhouse, London.

TO BUILDERS.

WANTED, a SITUATION as GENERAL or SHOP FOREMAN (of joiners), with good reference.—Address, J. H. B. 81, Upper Ebury-street, Eaton-square.

WANTED, by a first-rate DRAUGHTSMAN, WRITER, and COLOURIST, an ENGAGEMENT, to execute Maps and Plans of Estates, Towns, Parishes, Railways, Docks, Mines, Cemeteries, Drainages, Bases or Works and Local Board of Health Plans, &c. Has for eighteen years executed plans of projects of every variety, for the profession and the Government.—Apply, by letter, to R. THEODORE, 4, Trafalgar-square.

TO BUILDERS.

WANTED, a SITUATION for a YOUTH, aged 18. He can write a good hand, square dimensions, and trace drawings.—Address, B. B. care of Mr. Smart, 39, Manchester-street, St. Pancras.

WANTED, a SITUATION, by a well-experienced CLERK of the WORKS; is a good draughtsman, and competent to prepare working drawings; is well conversant in all the branches of building, and has first-rate testimonials.—Address, A. D. 10, Liverpool-street, King's-cross.

WHEELWRIGHT.—A respectable Married Man wishes for a permanent ENGAGEMENT on a Builder's or Contractor's Works. The most respectable reference and further years' character will be furnished. Not objection to town or country.—Address, H. S. 34, Ravelagh-grove, Pimlico.

TO PLUMBERS BUILDERS, AND OTHERS.

THE Advertiser, who thoroughly understands PLUMBING, PAINTING, and GLAZING, wishes for a PERMANENCY.—Direct E. P. 1, White Hart-court, Bishopsgate-street, London.—Town preferred.

TO ARCHITECTS BUILDERS, &c.

THE Advertiser, a Middle-aged Man, competent to prepare finished and working drawings, is open to an ENGAGEMENT. Salary moderate, or would be glad to employment. Good testimonials.—Address to A. Z. 37, Gloucester-street, Queen-square, Bloomsbury.

TO ARCHITECTS, SURVEYORS, AND BUILDERS.

THE Advertiser, who is a neat and expeditious draughtsman, and can materially assist in taking out quantities, &c. wishes for a SITUATION in either of the above offices. Salary moderate.—Address, S. S. S. Mr. Howell's, 25 Alfred-road, West-borne-grove.

TO CARPENTERS, BUILDERS, &c.

PORTLAND and ROMAN CEMENTS.—T. H. BOORMAN, WILD, and CO. MEDIAVAL LIME and CEMENT WORKS, LOWER HALLING, near Rochester. Agent at the Works Mr THOMAS WEEKES.

Agents in London, Messrs. GEORGE POUTER and CO. Limemerchants, Purfleet-wharf, Earl-street, Blackfriars, and No. 19, North-wharf-road Paddington.

PORTLAND and BATH CEMENTS.
TATHAM and CO.
14, South Wharf, Paddington.

PORTLAND and BATH CEMENT.—FULLWOOD THOMPSON and CO. request the attention of Merchants and Contractors to the quality of their Portland and Bath Cement, which they manufacture on an improved system, securing regularity of strength and colour, and at a less cost than is attainable by most other makers.

These cements set under water in a few minutes, and are not affected by extreme heat or cold.

FULLWOOD THOMPSON & CO. will be happy to send prices and samples in reply to application by post. They deliver free into the Bristol and Exeter Railway Company's trucks at their works, or free on board in the Port of Bridgewater.

GEO. & THOS. EARLE, CEMENT MANUFACTURERS, HULL.—Light, Dark, and Portland Cements equal to any made. Manufacturers also, and Dealers in Plaster, Paris White, Mastic, Hair, Lime, Lime Juice, Roman and Slate Slabs, Fire-bricks, Grindstones, Cement Chimney-tops, ditto Vases, Ridging, &c. Paints, Stucco, &c. Marble Merchants and Importers of Pozzolano.

11 George-yard, Lombard-street, City.

ELMLEY CEMENT WORKS.—ROMAN and PORTLAND CEMENT of the first quality, manufactured on the above works. Also STOCK and KILN-BURNT BRICKS, hand moulded and machine made, for shipment or otherwise.—Apply to G. BOOTH, Agent, as above.

KEENE'S and PARIAN CEMENTS and FRENCH PLASTER, for internal uses. These well-known hard Stuccoes dry quickly, and can be painted upon within a few days.—Made and sold by JOHN BAZLEY WHITE and BROTHERS, Millbank-street, Westminster.

ATKINSON'S CEMENT, so long known and esteemed in London for plastering purposes, is a quick-setting Cement, that requires no colouring.—Sold exclusively by JOHN BAZLEY WHITE and BROTHERS, Millbank-street, Westminster; and Seel-street, Liverpool.

ARTIFICIAL HYDRAULIC or PORTLAND CEMENT combines the valuable qualities of the natural Cements with the additional advantage that it greatly excels them in its cementitious properties; is not affected by frost, and does not vegetate in damp situations. Account of COMPARATIVE EXPERIMENTS on the strength of this and other Cements read at the Institute of Civil Engineers, to be obtained from the Makers, JOHN BAZLEY WHITE, and BROTHERS, Millbank-street, Westminster, who prepare one quality only of Portland Cement.

BATH, PORTLAND, and ROMAN CEMENTS.—The London and West of England Cement Company can offer to the Trade the best natural HYDRAULIC CEMENTS at reduced prices. The Company particularly recommend the best quality of their Bath Cement for all modelling cornices, decorations, &c. as having all the qualities requisite for an interior cement, and being quite unaffected by extremes of weather. The Company also supply BLUE LIAS LIME, lump and ground, which will carry more sand than any other lime.—All Communications to be addressed to the General Offices, 50, Old Broad-street, London; to Mr. MONUMENT, 4, Carolina-place, Clifton-road; to Mr. TIMEWELL, the Depôt, 9, North Wharf-road, Paddington; or to the Works, Dunball, Bridgewater.

SOUTHAM BLUE LIAS LIME DEPOT.
Glazed Stoneware Sewage Pipes.
Brick, Lime, and Cement Merchants,
TATHAM and CO.
14, South Wharf, Paddington.

PARIAN CEMENT, reduced in price 25 per cent. This article is valuable for inside stucco, and especially for skirtings, for flooring on brick arches, &c. It takes paint in a few hours after its application on walls or laths, is without efflorescence, and may be tapered in a couple of days. A finer quality forms a beautiful Scagliola, with any admixture of colours.—Manufactured by FRANCIS, BROTHERS, Cement Works, Nine-elms, London.

CEMENT.—ROMAN and PORTLAND CEMENTS, and PLASTER of PARIS, manufactured by C. J. HILTON, can be had in any quantity, wholesale and retail, at his wharf, 6, Upper Thames street, London; and also at the manufactory, Faversham, Kent.—N.B. These Cements supplied for shipment, on advantageous terms.

JOHNS and CO.'s PATENT PERMANENT STUCCO WASH (perfectly non-absorbent). STUCCO, CEMENT, STUCCO PAINT.—CLARK and BENGOUGH, Manufacturers, Grand Surrey Canal Bridge, Old Kent-road Office, 4, George-yard, Lombard-street.

PORTLAND CEMENT.—JAMES WESTON having enlarged that portion of his CEMENT WORKS on Millwall, Poplar, for Manufacturing the above CEMENT, begs to inform the Trade in general that they can be supplied with any quantity they may require, either at his Works, St. Andrew's Wharf, Earl-street, Blackfriars, or Middle Wharf, Scotland-yard, Westminster. Manufacturer of Roman, Lias, and Mastic Cements, English and French Plaster, &c.

PORTLAND and ROMAN CEMENT.
PLASTER of PARIS
Manufactured by J. M. BLASHFIELD, at Millwall, Isle of Dogs.
Warehouse, No. 1, Wharf, Paddington-basin

BLUE LIAS LIME.—CHAS. NELSON begs to offer to consumers a supply of Blue Lias lime direct from his Quarries in Warwickshire, the quality of which has been tested by several of the largest building firms in the metropolis and approved by them; and those who have favoured C. N. with their patronage during the last three years have always expressed themselves satisfied with his system of weighing or measuring the lime. When the lime is delivered by boat, the master has instructions to produce on demand the canal company's pass, by which the purchaser may know the exact weight delivered.—Orders addressed to the London Depôt, 16, South Wharf, Paddington, J. D. BLYTH, Sole Agent, will have immediate attention.—Quarries and Manufactories, Stockton, near Southam, Warwickshire.

HUBBUCK'S WHITE BODY PAINT of superior body to the Best White Lead, whilst it is as smooth and permanent as Zinc Paint. One coat laid on as directed is equal to two coats of White Lead, whilst the consumption of material is less than for one coat. It dries very fast and hard.

HUBBUCK'S STONE COLOUR BODY PAINT the same as the former, at three-fourths the price.

HUBBUCK'S PATENT WHITE ZINC PAINT is invaluable for Iron Ships and Iron exposed to salt water; neither blue water, nor noxious vapours from cargo, nor heat on funnels of Steam Vessels act upon it. Sold by the Wholesale Paint Dealers, in original packages, stamped, Hunnicx, London. PATENT; and when so marked the quality is guaranteed.

HUBBUCK'S COPPER COLOUR ENAMEL PAINT prepared expressly for the bottoms of Iron and Wood Steam Ships, a protection from rust and incrustation. Timber coated with this Enamel is not attacked by the worm neither do barnacles attach to it.

Full particulars of THOMAS HUBBUCK and SON, Paint and Varnish Works, opposite the London Docks, London.

OLD ZINC AND ZINC CUTTINGS BOUGHT TO ANY EXTENT.

CHARLES RICHARDSON,
3 & 6, SOUTH-WHARF, PADDINGTON BASIN.
COWLEY AND KENT BRICKS,
PORTLAND ROMAN, AND OTHER CEMENTS,
TAMWORTH GLAZED SEWAGE PIPES
BLUE VITRIFIED BRICKS, COPINGS, PIPES, &c.

NOTICE.

CHARLES RICHARDSON takes the earliest opportunity of informing Engineers, Architects, Contractors, and others, that he is now both the GREAVES'S BLUE LIAS LIME per the Great Western Railway from Harbury to Bull's-bridge and Paddington, from whence it can be delivered alongside any part of the river Thames, canals, or railway stations in London the day after it is burnt and ground, in any quantity, and at a great reduction in price.

All applications for prices and terms will meet with prompt attention.

N.B. Please observe the lime is ground at the works, not in London

GREY STONE LIME WHARFS,
12, UPPER GROUND STREET, Blackfriars (Surrey side),
7, NORTH WHARF-ROAD, Paddington.

WILLIAM PETERS begs to inform the trade he is in a position to supply the best GREY STONE LIME in any quantities from the above wharfs, or per barge direct from the kilns.

Large Grey Stone, or Grey Chalk, free on board at Works, 8s. per ton.
Barges loaded in a few minutes.
Wouldham-hall Grey Stone Lime Works, on the Medway, near Rochester.

NOTICE.

SOUTHAM HYDRAULIC BLUE LIAS LIME.

WILLIAM OLDHAM begs to inform those parties requiring genuine Hydraulic Blue Lias Lime, that he is prepared to deliver the best quality of ground and lump, into boats, at the Works.—Address, WILLIAM OLDHAM, Blue Lias Lime and Cement Works, Southam.

BLUE LIAS LIME.—Messrs. GREAVES and KIRSHAW having completed their Works on the Birmingham and Oxford Line of the Great Western Railway, at Harbury, are now prepared to supply LUMP and GROUND LIME of the best quality, direct from the kilns, to all the Stations on the Great Western Railway.—Greaves's Blue Lias Lime.—Portland, Bath, and Lias Cement.—Works, at Harbury, Stockton, and Wilmcote. Office, at Warwick.

PLASTER of PARIS manufactured by T. P. BLYTH, Baldwin's-place, Gray's-inn-lane, Holborn. The trade and shippers supplied on advantageous terms. Roman and Keen's Cement, Tiles, Plasterers' Hair, Pan and Plain Tiles, Fire Goods, &c

BRICKS of all kinds (clamp-burnt or kiln-burnt), Lime, Chalk, Chalk Rubbish for brick-making, Flints for building and pottery work, Foundry Loam, Washing Whiting, Sand for ashphalte, Land Drain Pipes, Patent Drain Pipes, Gas Soil for brick-making, &c. &c. sent by barge from Messrs. MEESON and CO.'S works at Grays, Essex, to any part of the Thames, the various canals, the river Lea, &c. or by rail to any stations on the London and Southend and Eastern Counties Railway, or any railway connected with them. Vessels of 200 to 600 tons can load alongside the wharves at Grays. At MEESON and CO.'S wharf and kilns, Bow-bridge, Stratford, Essex, the above named articles can also be procured, as well as all kinds of fire goods both Welsh and Newcastle. Fire-clay, Flare-burnt Lime, and Marble and Temper Lime; and here Lime is packed in hogsheads, casks, jars, &c for exportation

General Office—No. 12, GEORGE-YARD, LOMBARD-STREET. Letters addressed to Grays Essex, will meet with immediate attention.

BRICKS.—Malm Cutters, Yellow and Pale Seconds, Paviors, and Pickings, of good and sound quality, constantly on sale at H. DODD'S Brick-fields, which are only a quarter of an hour's walk from the City. H. D earnestly requests purchasers to favour him with a visit, in order to inspect his stock and to judge for themselves.

Malm Place, half-washed Stock, and Place Bricks, also on sale. These bricks are sound, well burnt, and unusually free from defects; a very large proportion of the stock being suitable for external facing.

Apply to HENRY DODD and CO. at the Counting-house, Hoxton Brick-fields, Grange-walk, near the Rosemary Branch, Hoxton

N.B. Light-coloured Pit Sand of a proved quality constantly on sale upon reasonable terms. This Sand, from its not containing any saline matter, is acknowledged to be preferable to river sand.

BLUE BRICKS and TILES, of superior quality, and in great variety of mould, for ornamental work, paving, coping, and general purposes.—GEO. C. RYLAND, Haulstone Wharf, Crescent, Birmingham.

THE BEST HERTFORDSHIRE MALM SECONDS;
THE BEST WHITE SUFFOLK and RED FACINGS;
WHITE SUFFOLK PERFORATED BRICKS;
DEEP-RED RUBBING BRICKS.
Also COWLEY and KENT STOCKS, in any quantities.

Norwood Lodge, Palace-road, Roupell park, Lower Norwood, Surrey.

THE PATENT BRICK MACHINE COMPANY invite orders for their IMPROVED MACHINES. One of them is working in a field at Caterham, near Croydon, and arrangements are made with the owner for hirers of a letter from the Secretary, to see it in operation every Thursday and Friday. It is the most simple machine invented. Trains from London-bridge to Warlingham (close to the field), leave at 6 and 9 30 a.m. and 3 p.m.; return at 9 55 a.m. and 7 35 p.m.

HENRY C. MOUNT, Sec.
37, King William-street, City.

BEADON'S EAVES GUTTER TILES.—MR. LAWES is prepared to CONTRACT for the ERECTION of the above TILES on roofs of all descriptions, in the south-eastern suburbs of London, at 7½ per foot; above 100 feet, 6d.—Office, 1, Adelaide-place, London-bridge.

BEADON'S PATENT IMPERISHABLE GUTTER-TILES,
For Spouting Roofs of Houses (either old or new, whether of thatch, slate, or tile, and other structures.
SOLE AGENT,
J. B. LAWES, 1, Adelaide-place, London-bridge.

This is the cheapest kind of spouting known; for, besides its lower cost, it will last without paint or repair as long as the building itself. It will bear the weight of any ladder; and in case of accident a labourer can repair it. It occupies the room of a large amount of roofing, effecting a great saving in slates, tiles, &c. It is especially applicable to the backs of houses in town, cottages, and agricultural buildings.

Price 4d. each tile of about 13 inches long; stop-ends and outlets, 6d. Any mason can put them up, or, if over 100 feet are required, a man will be sent to fix them at 5s. per 100. This charge to include tiles (delivered in Agent's yard), cement, and labour. May be had in London, Gloster, Bridgwater, and Rugby.

FOR SALE, 20,000 hexagon RED TILES, of first-rate quality, for flooring &c.—Apply by letter to Y. Z. Office of "The Builder," where a specimen may be seen and price obtained.

MINTON and CO.'S ENCAUSTIC and other PATENT TILES, for Churches, Entrance Halls, Conservatories, Balconies, &c.; Antique, Geometrical, and Alhambraic Mosaics, manufactured of a highly decorative character, and extreme durability, Slabs and Tiles for Fireplaces and Hearths, Covings for Grates, Door Furniture, White Glazed and Ornamental Tiles for Baths, Dairies, and Kitchen Ranges, may be had, in great variety at their Warehouse, 9, Albion-place, Blackfriars-bridge, London; and at their Manufactory, Stoke-upon-Trent, Staffordshire.

MAW and CO.'S ENCAUSTIC TILE PAVEMENTS, form a highly decorative and durable substitute for ordinary floorings, and their perishable oil cloth now in use for entrance halls, corridors, conservatories, baths, passages, &c. &c. Price 1 pattern-book forwarded, post-free, and sketches of the designs adapted to any given dimensions, supplied without charge, accompanied by estimates, on application to MAW and CO. Benthall Works, Broseley, Salop

PEAKE'S TERRO-METALLIC TILES, PIPES, &c.—Notice is hereby most respectfully given, that the LONDON DEPOT for this WARE is REMOVED to No. 31, WHARF, Macclesfield-street North, City-road Basin. Secondly, that the trade term, "TERRO-METALLIC," is the exclusive right of the Proprietor; and, thirdly, that the "REPORTS OF THE JURORS," page 581, of the Great Exhibition, rank the Manufactories known so long as "The Tileries," Tunstall, Staffordshire, as the first of the kind in the world.

PANTILES, PAVINGS, &c. — J. H. ANDREWS, Wisbeach, Cambridgeshire, begs to offer pantiles at 32s. 6d. per 1,000; floor bricks and 6-inch pavings, at 37s. 6d. per 1,000; 8-inch pavings, at 57s. 6d. per 1,000; plain tiles, at 30s. per 1,000, delivered. Cash prices.—Delivered on trucks in London or Eastern Counties Railway.

H. and R. HAYWOOD, Brownhills Blue Metallic Tileries, near Burslem, Staffordshire; London Depôt, 15, South Wharf, Paddington, Manufacturers of Improved Plain and Ornamental Roofing, Ridge, and Flooring Tiles, for Churches, &c.; also Metallic Plain and Socket Sewerage Pipes, &c. adapted for Sanitary and Railway purposes. They are extensively used on the London and North Western, Great Western, Trent Valley, North Staffordshire, and other Lines of Rail, and highly approved. Warranted impervious, and to resist all acids and exhalations.

*** A FIRST-CLASS MEDAL was awarded to H. and R. HAYWOOD, by the Jury of the GREAT EXHIBITION.

WILLIAM GILBERT, Manufacturer of all kinds and colours of Tiles, Quarries, Drain-pipes, Moulded Bricks, Brackets, Vases, Chimney-pots, Stoneware Glazed Sewerage Pipes, Ornamental Quoin Blocks, &c
Tividale, Staffordshire.

WINDOW-BLINDS.—J. FULLER, Manufacturer, 29, Charlotte-street, Blackfriars-road. Established, 1850.—Venetian Blinds, from 10s. each, or 8d. per foot; Wire ditto, 7s. each, or 1s. 9d. per foot; Holland ditto, from 5s. each, or 5½d. per foot. Every other description of Blinds equally low, warranted of the best manufacture. Discount to Builders and the Trade. Fixed complete.

WINDOW BLINDS.—TYLOR & PACE, Window Blind Manufacturers, 104, New Bond-street, and 3, Queen-street, Cheapside, London, submit the following PRICES of WINDOW BLINDS, which they can recommend as being made in the best manner:—Venetian blinds, per square foot, 9d.; best holland blinds, on rollers, 6d.; best ditto, on spring rollers, 9d.; gauze wire blinds, in mahogany frames, 3s.; perforated zinc blinds, in ditto, 1s. 10d.; outside blinds of striped cloth, 2s. Transparent blinds in great variety. Engravings, with prices and 4 accounts to Builders and the trade, forwarded on application, post free.

CHEAP AND DURABLE ROOFING.

By Her Majesty's  Royal Letters Patent.

F. McNEILL and CO. of LAMB'S-BUILDINGS, BUNHILL-ROW, LONDON, Manufacturers and ONLY Patentees of

MANUFACTORY AT AYLESFORD, NEAR MAIDSTONE, KENT.

The above Company having now been in existence for nearly seven years, and having regularly supplied DRAIN PIPES, &c. to some of the largest Works in and around London, viz.:—The New Castle Market, Wellington and Clarendon Barracks, Deptford Dockyard, Her Majesty's Commissioners of Works, &c. and in all instances parties who have used the Pipes have continued to do so, they undertake this as a fair test of the quality of the articles supplied by them: and as the Company have no Partners, Agents, or Travellers, offer their Goods to Contractors, Builders, and others, at prices which cannot be equalled by any Company NOT BEING IN ANY WAY CONNECTED WITH THE LONDON POTTERS' ASSOCIATION.

TO BUILDERS AND PLUMBERS.

The attention of the Trade is called to JOHN WARNER & SONS' PATENT VIBRATING STANDARD PUMP,

which is recommended for the simplicity of its construction, and the ease with which it works.

In the introduction of the vibrating standard, the cumbrous carriage and expensive slides and gearing are unnecessary, rendering the pump considerably less than Pumps made on the old plan.

Deep and Shallow Pumps for raising fluids from a depth not exceeding 24 feet, also Garden Pumps, constructed on the same principle.

JOHN WARNER & SONS,

8, Crescent, Jewin-street, London, Manufacturers and Patentees.

R. RICHARDS and CO. PUMP MANUFACTURERS and ENGINEERS

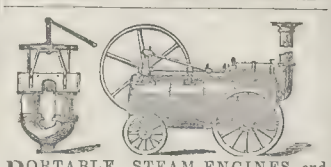
Pumps in Wrought and Cast Iron and Brass, bored by machinery, and fitted in the best possible manner, suitable for waterworks, mills, breweries, dairies, gardens, sinks, liquid manure, slops, farm and sinking, &c. adapted for any depth. Hydraulic Pumps for deep wells. PUMPS ON HIRE.

Pumps of any size, single or double barrel, up to double 18-in. diameter, kept ready for use at reduced prices.

N.B. The above can be worked either by hand, horse, or engine power.

Iron Pails 3s. per doz. painted.
Ditto .... 48s. per doz. galvanized.

Upper Ground-street, Blackfriars Bridge, Surrey Side.



STEAM PUMPING ENGINES.—PATENT PORTABLE STEAM-ENGINES, from four to ten-horse power, always ready to let on hire, by the week or month, for pumping, sawing, [illegible], raising materials, &c. &c.

Contracts taken for pumping any quantity of water.

JAMES BURTON & SONS,

Engineers and Contractors, Johnson-place, Holland-street, Southwark, London.

PORTABLE STEAM-ENGINES and PUMPS kept in Stock for Hire at reduced Prices. R. RICHARDS and CO. Pump Manufacturers and Engineers, Upper Ground-street, Blackfriars Bridge (Surrey Side).

CONTRACTORS' STEAM-ENGINES.—TO BE LET, on HIRE, or for SALE, several NEW and SECOND HAND STEAM-ENGINES of various powers suitable for contractors' work generally. Apply to Messrs. MAUDSLAY and HALL, Engineers, Surrey Iron Works, Blackfriars-road, where they may be seen.

LAND DRAINAGE.—Mr. THOS. SCOTT, 5 CHARING CROSS, LONDON, is now prepared to undertake large or small DRAINAGE CONTRACTS, and to complete the same in as short a space of time as may be required.—Reports as to the most improved system to be adopted, or its new drawing; and also to officers of the Crown.

MACINTOSH INDIA-RUBBER WAGGONCOVERS, of peculiar [illegible] sizes of different shapes also cases, and can be inspected at their Warehouse, Messrs. SON and DAVIES, 11 and 12, Aldersgate-street, and at the Factory, India-Rubber Steam Works, Bow-common.

DURABILITY of GUTTA PERCHA PIPING.—Many inquiries having been made as to the durability of the Patent Gutta Percha Tubing, the Gutta Percha Company have much pleasure in publishing both the following Testimonials:—

SIR RAYMOND JARVIS, Bart., VENNER'S HOUSE, NEWPORT, Isle of Wight.

Newport, Isle of Wight, March 14th, 1850.

In reply to your letter, dated this morning, concerning the Gutta Percha Tubing for Pump Service, I can state, with much satisfaction, it answers perfectly. Many persons have recently examined it, and there is not the least apparent difference since the first laying down, now several years, and I am informed that it [illegible] in the houses the water is elevated by it.

N.B. From this Testimonial it will be seen that the CORROSIVE WATER of the ISLE of WIGHT has no effect on Gutta Percha Pipes.

THE GUTTA PERCHA COMPANY, PATENTEES, 18, WHARF-ROAD, CITY-ROAD, LONDON.

HANCOCK'S PATENT VULCANIZED INDIA-RUBBER TUBING, HOSE-PIPES, WASHERS, [illegible] Solid Round Rubber Cord of all sizes of any length. Billiard Cushions and Rubber Springs for Carriages, Railways, &c. Vulcanized Rubber Sheeting, Paper, Canvas, and Prepared Vulcanized Rubber Solution for Paste.

Vulcanized Rubber in sheets from three to four feet wide and of any thickness. Air-beds, Pillows, and Cushions inflating Portable Baths, Invalid Cushions, and Articles of this kind made to any pattern to order.

N.B. All communications and orders punctually attended to, addressed to the Manufactory, JAMES BYNE HANCOCK, Gosset-mews, Gosset-road, London.

ROYAL POLYTECHNIC.—Patron:—H. R. H. PRINCE ALBERT.

Last Two Weeks of the Present Arrangements, previous to the Pantomime Season. Recreations and Professorships of Geology, Garden Theatre. Popular Lectures on Chemistry, &c. by J. H. Pepper, Esq. and Dr. Bachhoffner. These pipes are made for steam pressure, and burnt to great hardness, and are capable of bearing nearly double the hydraulic pressure of ordinary glazed pipes. The porous seamless red-ware is overcome by this manufacture, and it is well known that good earthenware, UNGLAZED is the oldest material discovered in a perfect state in Rome, Babylon, Nineveh, &c. &c.

LAMBERT'S SELF-CLOSING LAVATORY AND CLOSET VALVE No 7.

is adapted for high or low pressure, and for any kind of BASIN. Many hundreds are in use under continuous pressure of 100 to 200 feet: they are found to be exceedingly durable, and are cheaper than common cocks. Manufactured solely by the Patentees,

THOS. LAMBERT and SON,
Brass Founders and Engineers,

Lloyd's fan, five tons of cast and shear steel, ten tons of bar and rod iron, and numerous other effects.—To be viewed on Saturday and Monday previous to the sale, when catalogues may be had on the Premises; or of Messrs. FULLER and HORSEY, Billiter-street, City.

IMPORTANT WATER-SIDE PROPERTY, ON THE THAMES, IN THE CITY OF LONDON.

MESSRS. FULLER and HORSEY are instructed by William Crawshay, Esq. to SELL by AUCTION, on WEDNESDAY, OCTOBER 15, at TWELVE, at the MART (unless an acceptable offer is previously made by private contract), the splendid MERCANTILE PROPERTY, held under the Corporation of London, known as George-yard, Upper Thames-street, in the city of London, having a frontage next the Thames of 133 feet, and occupying a superficial area of about 34,000 square feet, a site unrivalled in the metropolis, either as a depôt for landing and loading goods or for carrying on any wholesale business for which extensive water-side premises are desirable. George-yard is universally known as the London establishment of Mr. Crawshay, the eminent ironmaster, and has been in the occupation of his family and predecessors for more than a century. The trade carried on ranks among the first in the City, the returns are very large, and, to any firm wishing to occupy the premises for the same business, a large proportion of the connexion may be transferred. In the year 1842 the counter expended many thousands of pounds in the erection of a massive pile of fine stone, 66 feet in length by 66 feet in width, abutting on to the river; the structure is of the most substantial character, and, if needful for the purpose of warehousing goods, the foundations and walls are quite equal to support an elevation of seven or eight stories above those already erected. The building is one lofty groundfloor, with gallery supported on iron girders and columns, and constructed to carry a heavy weight. There is also a stack of warehouses, abutting on the river, 75 feet in length, of two floors, and a stack of warehouses, 60 feet in length, of three floors, abutting on Thames-street. A counting-house in the centre of the yard, the lower part occupied as offices for clerks and principals. A comfortable dwelling-house in Thames street, and spacious paved yards, with a separate entrance, affording every convenience for loading and landing goods. The whole held on lease from the Corporation of London, for a term which will expire in the year 1900, subject to a ground-rent of 1,200l. per annum. A stack of warehouses adjoining, of three floors, with frontage of 133 feet in Castle yard, may be added if desired, at a rent of 150l. per annum To be viewed; the printed particulars and plans will shortly be ready, and may be obtained at the Mart; of Messrs. CROWDER and MAYNARD, Solicitors, 57, Coleman-street; and of Messrs. FULLER and HORSEY, Billiter street, London.

VICTORIA-STREET, WESTMINSTER.—Important Sale of new Building Materials, Plant, Stock, and Utensils of a Builder.

MESSRS. FULLER and HORSEY are instructed to SELL by AUCTION, on THURSDAY, SEPTEMBER 11, 1856, and following days, at ELEVEN o'clock precisely, in the PREMISES, Victoria-street, Westminster, in lots (without reserve), an important stock of well-assorted NEW BUILDING MATERIALS, partly prepared, adapted for first-class buildings; including 30,000 feet super. 1-inch and 2-inch plate-glass; 3,000 feet ditto, stained with sheet-glass; 400 feet 2-inch marginal sashes with ornamental glass; 1 feet ditto, not glazed; 6,400 feet 3-inch sashes and frames, 500 feet 2-inch ditto, 2,000 feet 3-inch Venetian sashes and frames, 800 feet 2-inch Venetian sash-frames; 20 cubic feet 4-inch mouldings in small lengths for square panels, 10 squares 1-inch, and 2 squares 1¼-inch deal flooring boards, 2,000 feet moulded architraves, 1,500 feet 6 by 3 door-frame, 800 feet cube Portland stone, 5,000 feet 9-inch touched York paving, 5,000 feet self-faced ditto, 2,000 feet York landings, 350 feet cube York stone, 1,700 feet cube granite, 600 feet iron girders, 90,000 stock and fire-bricks, 400 yards cast-iron rain water-pipe, 30 register and hall stoves, 20 black and bright fenders, 40 marble chimney-pieces, 15 slate cisterns, 12 copper baths, 10 gas stoves, 30 coils iron-pipe, 8 galvanized tanks, gas brackets and pendants, 10,000 feet iron tube, an assortment of T's, elbows, bends, sockets, &c., 1,000 sheets of lead, 1,000 feet moulded skirtings, 1,500 feet 6 by 3 and corners, 200 feet muslin pattern glass, 500 feet polished embossed and ground plate-glass, 200 feet ditto, in various sizes, 20 tons cast iron girders, 2 tons wrought ditto, 2 tons paper-hangings, 5 tons sheet and pipe lead, traps, service boxes, &c. 4 cwt. brass tube, 10 cwt. of brass castings, dusters, brushes, pencils, &c. The plant will include a Clark's portable steam-engine, an hydraulic lift, 7 hoisting machines and chains, mortar mill, sweeping machine, 5 stone trucks, 7 Asphalte pots, crab-cranes, blocks and falls, 2,000 scaffold boards, 1,000 scaffold poles, 10 to 40 feet; 1,000 feet run 3-inch plank, 500 dozen scaffold cords, 60 ladders, 30 benches, barrows, 6 brass-finishers' lathes, smiths' forges, vices, anvils, benches, air furnace, moulding trough, and tongs, 3 painters' machines, 24 pair steps, and trestles; an assortment of stocks and dies, steel tools, 50 dozen new files, 100 pair gas metal (wood) patterns, and numerous other effects. To be viewed four days previous to the sale, when catalogues, at 6d. each, may be had on the Premises; and of Messrs. FULLER and HORSEY, Billiter-street.

SALES BY AUCTION.

Highly-finished Condensing Steam Engine, by Nasmyth.

MESSRS. FULLER and HORSEY are instructed by the First Commissioner of her Majesty's Board of Works, to SELL by AUCTION, at HERBERT'S-BUILDINGS, Waterloo-road, on WEDNESDAY, SEPTEMBER 24, at ELEVEN, a highly-finished, direct acting, CONDENSING STEAM-ENGINE, by Nasmyth, with 14-inch cylinder, 5-feet stroke, 5-slide-valve, throttle-valve and governors, air-pump and two feed pumps, with solid cast-metal eccentric, bright wrought-iron crank shaft, fly-wheel, condenser, and apparatus, made for the House of Parliament.—To be viewed on Tuesday previous to the sale, when catalogues may be had on the Premises; and of Messrs. FULLER and HORSEY, Billiter-street, City

BOROUGH-ROAD.—Well executed Groups, Figures, Vases, Fountains, &c. in Artificial Stone.

MESSRS. EVERSFIELD and HORNE are instructed by the Proprietor to SELL by AUCTION, on the PREMISES, 74, Borough-road, Southwark, on TUESDAY, SEPTEMBER 9, 1856, at TWELVE for ONE, the remaining portion of the extensive STOCK; comprising fountains, vases, groups pedestals, centre flowers, &c. To be sold without reserve—May be viewed one week previous, and catalogues had on the Premises and of the Auctioneers, 40, Parliament-street, Westminster.

TO TIMBER MERCHANTS, BUILDERS, SHIP-BUILDERS, CABINET-MAKERS, PIANOFORTE-MAKERS, &c. AND OTHERS.—On the Premises, Snow's-fields, King-street, Borough, and Robinson's Saw-mills, Swan-street, Grange-road, Bermondsey.

MR. PEAKE is favoured with instructions from the Executors of the late Thos. Elliston, esq. to SELL by AUCTION, on the PREMISES, on TUESDAY, SEPTEMBER 9, 1856, and two following days, at TWELVE o'clock each day, his well known, superior, and well-seasoned STOCK in TRADE; comprising 25,000 feet Spanish and Honduras mahogany, in planks and boards, 15,000 planks, deals and battens, flooring boards, mixed, lining, 1-inch feet wainscot, Spanish, Honduras, and walnut veneers; 800 feet Spanish cart logs, a large quantity of perfectly dry pine, Honduras boards, oak, ash, and all woods, in all twenty loads of Baltic Timber, &c. —May be viewed Monday previous and mornings of sale. Catalogues obtained on the Premises; at Rennie's Saw-mills; and at Mr. PEAKE'S Offices, 344, Tooley-street, Southwark. Approved bills at three months will be taken from purchasers to the amount of 20l. and upwards. Luncheon provided.

WOOLWICH, KENT.—To BUILDERS and others.

MR. G. HUDSON has received instructions from the Lords of the Admiralty, to SELL by AUCTION, upon the PREMISES, near the Royal Marine Barracks, on WEDNESDAY, SEPTEMBER 17, 1856, at ONE for TWO o'clock, in lots, the valuable BUILDING MATERIALS, and HOUSE FIXTURES of Bennet Cottage and Office, late the residence of Captain Yarde, R.M. together with the greenhouse adjoining, 21 feet 6 inches by 10 feet.—Catalogues may be had at Her Majesty's Dockyard, Woolwich; and of the Auctioneer, Brewerstreet, Woolwich.

GRAVESEND, KENT.—Three Freehold Private Residences in Parrock-street.

MR. CHARLES JOHNSON has received instructions to SELL by AUCTION, from the executors of Mr. J. Little, at the NEW INN, Gravesend, on WEDNESDAY, the 3rd of SEPTEMBER, 1856, at THREE o'clock, exact time, in lots, THREE FREEHOLD PRIVATE RESIDENCES, known as Nos. 13, 14, and 15, Parrock-street, in the occupation of respectable tenants, and producing a rental of 73l. per annum. This eligible estate is situate in the centre of the town, and offers an unusually eligible opportunity for Investment. Particulars and conditions of sale may be obtained of Messrs. GIBSON and WATES Solicitors, Gravesend and Dartford; at the Place of Sale; and of Mr. CHARLES JOHNSON, Auctioneer, Valuer, and Estate Agent, 39, Harmer-street, Gravesend.

GRAVESEND, KENT.—Valuable Freehold Estate, producing 45l. per annum.

MR. CHARLES JOHNSON has received instructions to SELL by AUCTION, at the NEW INN, Gravesend, on WEDNESDAY, SEPTEMBER 3rd, 1856, at THREE o'clock precisely, in one lot, that FREEHOLD PLOT of BUILDING LAND, situate on the north side of the MILTON PARK ESTATE, comprising plots of Building Land, in the Grove and Wellington-street; Fifteen Freehold Private Dwelling-houses, producing 270l. per annum; also Freehold Peacock street, producing 27l. per annum; a well-secured Freehold Ground-rent, of 7l. per annum; also Three Freehold Houses, Nos. 9, 10, and 11, Peacock-street, producing 45l. per annum—Particulars and conditions of Sale, with plans of the Estate, may be had (ten days before the sale, of G. M. ARNOLD, Esq. Solicitor, Berkeley-crescent, Gravesend; of G. H. KNIGHT, Esq. Solicitor, 5, Essex-court, London; of Mr. H. NEWMAN, and Messrs. GUARD and HOWSEGOE, House Agents, Harmer street; Mr. J. GOULD, Jun. Surveyor, Gravesend; at the Place of Sale; and of Mr. CHARLES JOHNSON, Auctioneer, Estate Agent, and Valuer, 39, Harmer-street, Gravesend.

GRAVESEND, KENT.—Eligible Freehold Estate in Peacock-street.

MR. CHARLES JOHNSON has received instructions to SELL by AUCTION, at the NEW INN, Gravesend, on WEDNESDAY, SEPTEMBER 17, 1856, at THREE o'clock precisely, in lots, FOUR FREEHOLD PRIVATE RESIDENCES, being Nos. 31, 32, 33, and 34, Peacock-street, in the occupation of respectable tenants, and producing a rental of 72l. per annum—Particulars and conditions of sale may be obtained of G. M. ARNOLD, Esq. Solicitor, Berkley-crescent, Gravesend; of G. H. KNIGHT, Esq. Solicitor, 5, Essex-court, Temple, London; of Mr. H. NEWMAN, Bond-street, Dover; Messrs. GUARD and HOWSEGOE, Harmer-street, Gravesend; Mr J. GOULD, Jun. Surveyor, Gravesend; at the Place of sale; and of Mr. CHARLES JOHNSON, Auctioneer, Valuer, and Estate Agent, 39, Harmer-street, Gravesend.

TO MAHOGANY MERCHANTS, CABINET MAKERS, SHIP and RAILWAY-CAR BUILDERS, and others.—To BE SOLD by AUCTION, on WEDNESDAY NEXT, the 3rd SEPTEMBER, 1856, at ELEVEN o'clock precisely, in the WOOD SALES SHED, Brunswick Dock, Liverpool,—

- 600 Logs Honduras Cedar,
- 900 Logs and Carls Colo Mahogany,
- 672 Logs and Carls St. Domingo Mahogany,

Being the cargoes just landed per steamer "May Flower," "Marie Leocadie," and "Adelgunde," direct from Cuba and St. Domingo, respectively. On account of the Importers.

The above wood is well worthy the attention of shell-grown Honduras Mahogany, Hyas, Wainut, Bahia Rosewood, Bird eyed Maple, Pencil Cedar, Riga Wainscot, Billets, &c. &c. particulars of which may be seen in catalogues lying at the Office of this newspaper, and the same may be had by addressing the Broker.

Mahogany is now a cheaper wood than teak or Greenheart, these last-named being 1l. 5s. per load per measurement on the contract, every piece of mahogany, however small, and frequently presented as rare, so that while paying for 2 feet, he actually receives 3 feet per measurement, Queen's calliper. The importer of the Honduras Cedar and Cuba Mahogany, "May Flower," has actually paid freight on 189,034 feet of the former, and 1,033 feet of the latter, which is 190,067 cubic feet, against 17,903 cubic feet; thus paying freight in excess of 114,970 superficial feet, or 59½ per cent. on the actual amount of the freight. The Mahogany and Cedar per this vessel are not of large diameter, but are extremely long, thereby valuable for ship-building and railway carriages and waggons, and the price probably will not be more than equivalent to 10l. per load, Queen's caliper measure, while Teaks and such woods range up to 15l. per load. Railway carriages and waggons are now built of self-coloured woods: varnished mahogany and cedar, if so dealt with, would be more handsome, cheaper, and more durable than most woods, and could be more easily worked and altered, besides which they shrink and expand less than any other woods, most important considerations in railway-carriage work: exported to warmer countries.

EDWARD CHALONER, Broker,
No. 6, East Side, Queen's Dock, Liverpool.

SALES BY AUCTION.

IN BANKRUPTCY.

MR. ALFRED DAY has received instructions from the assignees of Messrs Rowland and Evans, bankrupts, to SELL by AUCTION, on the PREMISES, in the field known as the Cricket-field, near the late Cattle-market, Lower-road, Islington, on TUESDAY, the 9th of SEPTEMBER, 1856, at TWELVE o'clock without reserve, the second portion of the extensive STOCK and UTENSILS of a Builder, comprising an 8-horse power steam-engine, 3-horse do. 10-horse egg-end boiler, circular-saw table, up and down frame do. planing table, grooving machine mortise do. moulding do. tenoning do. MR. MARSH has received instructions from the Executors of the late Thos. Hunt, esq. to SELL by AUCTION, on the PREMISES, Well-street, Sydenham, on THURSDAY, SEPTEMBER 11, 1856, at THREE for FOUR o'clock, in convenient lots, 600,000 of superior STOCK, PLACE, and other BRICKS The premises are close to three railway stations, and in the vicinity of excellent roads.—May be viewed the day prior and morning of sale, and catalogues obtained of the Premises; the principal Inns in the neighbourhood; and at Mr. MARSH'S Offices, 2, Charlotte-row, Mansion-house.

17, PUDDING LANE, CITY.—Lease of Premises, Stock of a Builder, and Effects, by

MR. RICHARDS, on the PREMISES, on TUESDAY, SEPTEMBER 2nd, at TWELVE o'clock, by direction of Mrs. Hinton, on retiring from business. The STOCK comprises sixty round and other timber, long scaffold poles, boards, purlins, cords, screens, plasterers' steps, and a variety of tools. You pass from Lombard-street into the bankers, pantiles, iron door, &c. Also the lease of the commodious premises held from the City at the low rent of 50l. per annum.—On view the morning of sale. Catalogues obtained on the Premises, and of the Auctioneer, Tottenham.

TO MASONS and OTHERS.—The STOCK, IMPLEMENTS, and GOODWILL of a small but very long-established BUSINESS in Marble, in mourning and general work, in a market town in Devon, TO BE DISPOSED OF. This is an unusual opportunity of purchasing business with a small capital.—For address and particulars, apply, prepaid, to C. 29, Vauxhall-bridge-road, Westminster

BUILDING BUSINESS TO BE SOLD.—That is an eligible JOBBING BUSINESS, and is sold upon account of the premises of Mr. Thomas Hall, Bridge-road, Cottingham, and will include everything. Rent of premises, 35l.—For full particulars, apply to Mr. C. BROWN, House and Estate Agent Hammersmith.

TO PAINTERS, PLUMBERS, and GLAZIERS.—TO BE DISPOSED OF (in consequence of the death of the proprietor), a small OLD-ESTABLISHED BUSINESS in the above Trades, with a respectable connection, and capable of great extension. The premises and tools are ready with every convenience. The terms are moderate.—Apply to Messrs WM ROBERTS and CO. Falcon Wharf, Hollandstreet, Blackfriars, London.

BUILDER'S BUSINESS FOR DISPOSAL. TO BE DISPOSED OF, by order of the Executors, an old-established BUSINESS, with a first-rate connection, situate in a small country town about thirty miles from London. The works executed by the late proprietor have gained for the concern a high reputation; they have included the erection and restoration of several churches and others, both of a substantial and ornamental character. The trade are very complete in their arrangements: the rent nominal, and the stock well selected. The amount required will be from 1,200l. to 1,500l. There are several substantial cottages and land which will be included in the purchase. The business has been conducted by the late proprietor and his ancestors for more than half a century, and to any practical man of business a more eligible opportunity can rarely be met with. For further part culars, apply to Messrs. FULLER and HORSEY, Billiter street, City

TO ENGINEERS, BOILER-MAKERS, and OTHERS. TO BE DISPOSED OF, the STOCK and PLANT of an ENGINEER and IRONFOUNDER, situate in a large manufacturing town in the north of England. The premises are spacious and well arranged with steel facings for tool and water-carriage. The plant now at work is capable of employing fifty hands, and the trade is of a first-class character, and as the business is well established, this is a favourable opportunity for an enterprising person with a moderate capital.—Letters to be addressed to D. TAYLOR, Esq. Kennington-park, Surrey.

PLUMBING, PAINTING, or GLAZING.—The Advertiser, having some SURPLUS LABOUR, would request to TENDER for any quantity of WORK in the above line with or without materials. Any party requiring work done would find this worthy their notice.—Address, THOS. STANWAY, 10, Dorset-street, Portman-square, London.

LONDON: Printed by CHARLES WYMAN, of 13, Hunter-street, Brunswick-square, in the Parish of St. George, Bloomsbury, Printer, at the Printing-offices of COX (Bros.) & WYMAN, 74 & 75, Great Queen-street, Lincoln's-inn-fields, in the Parish of St. Giles-in-the-Fields; and published by the said CHARLES WYMAN, at the Office of "THE BUILDER," 4, Wellington-street, in the Parish of St. Paul, Covent Garden, all in the County of Middlesex.—Saturday, August 30, 1856.

BUILDERS' BENEVOLENT INSTITUTION.—The NINTH ANNIVERSARY DINNER will be held at the LONDON TAVERN, on WEDNESDAY, 29th OCTOBER next, Mr. Alderman WILLIAM LAWRENCE, President, in the Chair.

Gentlemen desirous of promoting the interests of the Institution by becoming Stewards, will be pleased to forward their names to the Treasurer, Mr. GEORGE BIRD, 34, Sloane-square; or to the Secretary, at the Offices, 19, Southampton-street, Bloomsbury.

A. G. HARRIS, Secretary.

BUILDERS' BENEVOLENT INSTITUTION.—An ELECTION of PENSIONERS will take place 27th NOVEMBER next. Candidates may obtain forms of application to be returned on or before 29th SEPTEMBER) at the Offices of the Institution 19, Southampton-street, Bloomsbury.

Pensions: £24 per annum for males, and £16 for females.

August 28, 1856. A. G. HARRIS, Secretary.

ARCHITECTURAL EXHIBITION and COLLECTION of MATERIALS, PATENTS, and MANUFACTURES connected with Architecture.—All Drawings, Models, Photographs &c. must be delivered at the Galleries Suffolk-street Pall-mall East, on the 1st and 2nd of DECEMBER next. The printed rules may be had on application to the Hon. Secretaries.

The Committee announce with much satisfaction that the Rev. Mr. Boutell, Mr R. W. Billings, Mr. Owen Jones, Mr. George Scharf (unless circumstances in the mean time should interfere), and other gentlemen, have kindly promised Lectures for the Tuesday Evenings, as on the last occasion. Full particulars will be published as soon as arrangements are complete. Season tickets, admitting at all times to the Exhibition and to all the Lectures, will be half-a-crown, as before.

DEPARTMENT for MATERIALS.—Persons desirous to make their inventions known, will find this the best and indeed only way of bringing them under the notice of the whole body of Architects in London and the country; and the Committee request that applications for space (directed to Mr. JAMES EDMESTON, Jun. Hon. Sec.) may be made at once, as full two-thirds of the two rooms devoted to this purpose has been already applied for, and many who delay will certainly be disappointed

Intending subscribers should send their names to the Secretaries; and it is requested that unpaid subscriptions for last year may be forwarded at once, as the issue of the balance-sheet is delayed until these are received.

JAMES FERGUSSON, F.R.A.S., 20, Langham-place, } Honorary
JAMES EDMESTON, jun. } Secretaries.
5 Crown-court, Old Broad-st.

COMPETITIONS.

TO SURVEYORS and OTHERS.—PREMIUMS for PLANS.—The Trustees for Sale of a Freehold Estate of 50a acres, including the Scotch Sow and near the Crystal Palace, require PLANS for LAYING OUT the SAME for building purposes, showing the necessary roads, sewers &c. the whole to be clearly defined and apportioned in suitable lots, and laid down to a scale of two chains to an inch, from actual admeasurement. The following premiums are offered:—For the plan adjudged the best by the trustees, 15 guineas; for the second, 100 guineas; for the third, 50 guineas. The plans to which the above premiums shall be awarded, will be retained by and be the property of the trustees.—Further particulars may be obtained of Mr. PEACOCK Builder, near the Jolly Sailor Station, Norwood, close to the property. The trustees will meet on the 20th day of OCTOBER next, to examine the plans, which are to be previously forwarded enclosed and sealed, to the Secretary's Office, Auction Mart, London, addressed to the Trustees of the White Horse, Norwood, Estate.

CONTRACTS.

NOTICE to BUILDERS and CONTRACTORS.—ORDNANCE WORKS.—The Commanding Royal Engineer of the Dover district hereby gives Notice, that sealed TENDERS will be received at the Office of the Director-General of Contracts, Pall Mall, London, on or before WEDNESDAY, the 10th day of SEPTEMBER, 1856, from persons desirous of CONTRACTING for TAKING DOWN and REBUILDING portions of the SCARP WALLS of the CITADEL, Dover. A specification of the works to be executed, may be seen by persons duly competent to undertake the work (none others need apply), and forms of tender obtained at the Royal Engineer Office, Dover between the hours of TEN and FOUR o'clock, from MONDAY the 1st of SEPTEMBER, to TUESDAY, the 9th of SEPTEMBER, 1856 (Sunday excepted). The party whose Tender may be accepted for the work, will be required to enter into a bond, with two eligible securities, jointly and separately, to be bound under a penalty of £600, for the due performance of the Contract. Tenders for the above work to be addressed to the Director-General of Contracts, Pall-Mall, London, and endorsed "Tender for Repairing Scarp Walls, Citadel, Dover."

N.B. The War Department reserve to themselves the right of rejecting the whole or any of the Tenders.

Royal Engineer Office, Dover, August 28, 1856.

TO BUILDERS.—Notice is hereby given that TENDERS will be received at the Office of the Director-General of Contracts, War Department, Pall-mall, London, on or before the 15th SEPTEMBER, 1856 from such persons as may be desirous of contracting with the War Department for CONSTRUCTING and ERECTING FOUR POWDER MAGAZINES (to contain 55,000 barrels), and EIGHT SHOEING-SHEDS, together with boundary walls, rolling stage, and earth traverse, at Marchwood, in the county of Hants. Plans and specifications, with forms of Tender, may be seen, and all other information obtained, on application at this Office, any day (Sundays excepted) between the hours of TEN and FOUR, from the 25th AUGUST, 1856, to 14th SEPTEMBER, 1856. The time of the work to be completed within eight calendar months from the date of notification of acceptance of Tender. No notice will be taken of any Tender unless it be on the prescribed form. The War Department reserve to themselves the right of rejecting the whole or any of the Tenders.

Royal Engineer Office, Portsmouth, 19th August, 1856.

TO BUILDERS.—Notice is hereby given, that TENDERS will be received by the War Department, at their Office, Pall-Mall, London, on MONDAY, the 8th day of SEPTEMBER, 1856, from such persons as may be willing to undertake the ERECTION of a BOMB-PROOF MAGAZINE to contain 10,368 Barrels of Gunpowder, at Tipner, near Portsmouth, in the county of Hants. The plans, specification, and conditions of Contract, may be seen, and every information obtained on application at this Office on or after the 24th day of AUGUST, 1856, between the hours of TEN and FOUR each day (Sundays excepted). Tenders to be endorsed, "Tender for the Erection of a Bomb-Proof Magazine, at Tipner, near Portsmouth, in the county of Hants."

N.B. The War Department reserves to itself the right of rejecting the whole or any of the Tenders.

Royal Engineer Office, Portsmouth, August 7, 1856.

NOTICE to CONTRACTORS and BUILDERS.—TENDERS will be received by the Director-General of Contracts, War Department, Pall-mall, London, on or before the 6th OCTOBER next, from such persons as may be willing to enter into a CONTRACT for the CONSTRUCTION of a FORT, near the village of Elson, in the county of Hants. Plans and specifications may be seen, and every information obtained on application at the Royal Engineer Office, Gosport, between the hours of TEN and FOUR daily, from the 15th SEPTEMBER to 4th OCTOBER, 1856. No notice will be taken of any Tender unless upon the printed form. The War Department reserve to themselves the right of rejecting the whole or any of the Tenders

Royal Engineer Office, Portsmouth, August 25, 1856

NOTICE to BUILDERS.—ORDNANCE CONTRACT.—The principal Officers of her Majesty's War Department hereby give Notice, that they will receive PROPOSALS for the following CONTRACT, viz.:—For the several Works proposed to be executed for the ERECTION of QUARTERS for NON-COMMISSIONED OFFICERS and MARRIED SOLDIERS, Laundry, Drill-shed, and Privy, together with Rebuilding a Portion of the Boundary Wall, &c. at Beggars-bush Barracks, Dublin. Persons desirous of Tendering for the same, will receive every information on application at the District Commanding Royal Engineer's Office, Lower Castle-yard, Dublin, and may obtain a specification, with the terms of Contract. The Building-wall to be completed sixty days after the acceptance of the Tender and the whole of the buildings roofed by the 10th March, 18 7, and the remainder of the Works to be completed on or before the 31st July, 1857.—The letters of Tender, with specifications, to be sealed, and transmitted, under cover, to "The Director-General of Contracts, War Department, Pall-mall, London," so as to be received on or before the 15th day of SEPTEMBER, 1856 and to be marked on the outside, "Tender for Work at Beggar-bush Barracks, Dublin."

Commanding Royal Engineer's Office, Dublin, 29th August, 1856

NOTICE to BUILDERS.—ORDNANCE CONTRACT.—The Principal Officers of her Majesty's War Department hereby give Notice, that they will receive PROPOSALS for the following CONTRACT, viz.:—For the several Works proposed to the ERECTION of CAVALRY QUARTERS and STABLING, together with OUT-BUILDINGS, at the BARRACKS at ISLAND BRIDGE Dublin. Persons desirous of Tendering for the same will receive every information on application at the District Commanding Royal Engineer's Office, Lower Castle-yard, Dublin; and at the Royal Engineer's Office, Island Bridge Barracks; and may obtain specifications, with the terms of contract. The soldiers' ablution-room to be completed, and all the buildings roofed in, by the 1st of MARCH, 1857, and the remainder of the works completed on or before the 31st of AUGUST, 1857. The letters of Tender, with specifications, to be sealed, and transmitted, under cover, to "The Director-General of Contracts, War Department, Pall-mall, London," so as to be received on or before the 15th day of SEPTEMBER, 1856 and to be marked on the outside, "Tender for Work at Island Bridge Barracks, Dublin."

Commanding Royal Engineer's Office, Dublin, August 29, 1856.

CONTRACTS.

NOTICE to BUILDERS and CONTRACTORS.—The Commanding Royal Engineer at Guernsey hereby gives Notice, that sealed TENDERS will be received by the Director-General of Contracts, War Department, Pall-mall London until TUESDAY, the 23rd of SEPTEMBER, 1856, for CONSTRUCTING a small BATTERY, ERECTING BARRACK BUILDINGS, with enclosure walls, &c and FORMING DITCHES, GLACIS, and ROAD, at HOMMET POINT, in the Island of Guernsey. Detailed drawings of the works may be seen, and every requisite information obtained, on applicat on at the Royal Engineer Office, Guernsey, every day (Sundays excepted), between the hours of NINE and FOUR. The terms of contract, specification for the works, and forms of Tender, may be procured at the Office of the Inspector General of Fortifications, War Department, Pall-Mall, London; as well as at the Royal Engineer Office, Guernsey. Each Tender to be in one lump sum, in British sterling, for the whole work, to be attached to a copy of the terms of contract and specification, addressed to "The Director-General of Contracts, War Department, Pall-Mall, London," and endorsed, "Tender of Works at Hommet, Guernsey." The War Department reserve the right of rejecting any or all of the Tenders.

Royal Engineer Office, Guernsey, August 27, 1856.

TO BUILDERS.—Sealed TENDERS for BUILDING the ESCARP of the right flank of the Flat Bastion, and part of the adjoining Curtain in the Lines of Devonport, will be received by the Director-General of Contracts, at the War Department, Pall-mall, London, on or before FRIDAY, 12th SEPTEMBER, at NOON. Specifications may be seen at the Royal Engineer's Office Devonport, on week days, between the hours of NINE and FOUR o'clock, from THURSDAY, 4th SEPTEMBER, to THURSDAY, 11th SEPTEMBER, both days inclusive.

Royal Engineer's Office, Devonport, 28th August, 1856.

TO BUILDERS.—Sealed TENDERS for BUILDING NEW BARRACKS for non-commissioned officers and married soldiers, at Devonport, including all requisite Pavements; also, separate Tenders for the Asphalte Work required for same, will be received at the War Department, Pall-Mall London, on or before TUESDAY, the 30th SEPTEMBER next, at NOON, addressed "To the Director-General of Contracts," and endorsed "Tender for Married Soldiers' Barracks, Devonport," "Asphalte Work for Married Soldiers' Barracks, Devonport" as the case may be), on the left-hand corner of the envelope. The barrack comprises—three blocks of two story buildings, laundry, cook-houses, outbuildings, ash-pits, enclosure walls, gates, footpaths, roads, and parade.

Plans and specifications, with terms and conditions, may be seen, and forms for Tenders and every information obtained at the Royal Engineer's Office at Devonport, between the hours of NINE and FOUR o'clock on week-days, from MONDAY, the 15th, to SATURDAY, the 27th SEPTEMBER next, both days inclusive

TO BUILDERS and CONTRACTORS.—Persons desirous of TENDERING for the ERECTION of the proposed NEW FORT and BATTERY at Grange, near Gosport, may obtain all necessary information, bills of quantities, and forms of Tender, from Mr. P. F. CASLIN, C.E. and Architect duly of the Royal Engineer Department, 16, Bond-street, Shefhe d, and Mr J. JAMES, 3, John street, Adelphi, London, who are retained by parties about to Tender.

134 Hi h street, Gosport, Aug. 28, 1856.

TO BUILDERS and CONTRACTORS.—NEWARK CHRIST-CHURCH SCHOOLS.—Persons desirous of CONTRACTING with the Committee for the ERECTION of NEW INFANTS' and GIRLS' SCHOOLS, in CORTLAND-STREET, in the Parish of NEWARK-UPON-TRENT, may see the drawings and specification, and obtain all further information, on application at my Offices, in Kirkgate, on and after WEDNESDAY, SEPTEMBER 3rd, until WEDNESDAY, SEPTEMBER 17th, on which day I shall receive sealed Tenders, endorsed, "Tender for Newark Christ-Church Schools," and to be delivered at my Office before SIX o'clock.—The Committee do not bind themselves to accept the lowest or any of the Tenders sent in.

CHARLES BAILY, Architect.

Newark, August 27, 1856.

SOUTHAMPTON LOCAL BOARD of HEALTH.—TO STONE-MERCHANTS, CONTRACTORS, and OTHERS.—Notice is hereby given, that the Southampton Local Board of Health are prepared to receive TENDERS from any person or persons willing to supply from 1,000 to about 1,600 TONS of BROKEN GUERNSEY GRANITE STONE, for repairing the Macadamized roads within their district. Specifications may be seen and information obtained on application to Mr. POOLE, Surveyor to the Local Board of Health, Southampton. Sealed Tenders (according to the forms mentioned in the specification), must be delivered at my Office on or before the 19th day of SEPTEMBER next. No pledge is given to accept the lowest or any other Tender.—By order of the Local Board of Health,

CHARLES E. DEACON, Clerk.

Public Health Office, Southampton, August 27, 1856.

FARM BUILDINGS and DWELLING-HOUSE.—Persons desirous of CONTRACTING for the ERECTION of either or all of the following WORKS, for the Earl of Essex, may see the plans and specification at the Office of Mr. HUMBERT, Land Agent and Surveyor, Watford, Herts.

1. FARM BUILDINGS, at Rayne Hall, in the parish of Rayne, near Braintree, Essex.
2. FARM BUILDINGS, at Porter's Hall, in the parish of Stebbing, near Dunmow, Essex.
3. A DWELLING-HOUSE, at Walkern Park, in the parish of Walkern, near Stevenage, Herts.

All Tenders must be delivered to Mr. HUMBERT on or before the 23rd day of SEPTEMBER, on which day, at noon, they will be opened at his Office.—The Advertiser does not bind himself to accept the lowest or either of the Tenders.

[*For remainder of Contracts see next page.*

CONTRACTS.

TO BUILDERS.—TENDERS will be received from competent parties for Works to be done in ALTERING and REPAIRING the HOUSE and PREMISES, No. 33, Euston-square. The specification and drawings may be seen at the Office of Mr. ROBT. W. ARMSTRONG, Architect, 16, Essex-street, Strand. The Proprietor does not bind himself to accept the lowest Tender.

TO BUILDERS and OTHERS.—Persons desirous of contracting for the ERECTION of a POLICE STATION and FOUR HOUSES at Luton, Bedfordshire may see the plans and specifications at the Office of Messrs. WILLIAMSON and AUSTIN, Solicitors, Luton, on and after the 1st day of SEPTEMBER next. The Tenders to be sent in sealed and marked "Tender for Police Station and Court-house, Luton," on or before TWELVE o'clock on the forenoon of SEPTEMBER next—the lowest or any Tender will not necessarily be accepted.

TO BUILDERS.—TENDERS are requested for the ERECTION of AGRICULTURAL CHAPEL, at Buckingham; the plans and specifications for which, may be seen on and after the 1st of SEPTEMBER next, at the Office of Mr. WILLIAM WALKER, Esq. Buckingham; or at the Offices of Messrs. POSTER and WOOD, Architects, 4, Park-street, Bristol. The Tenders are to be sent to WILLIAM WALKER, Esq. sealed and endorsed, "Tender for Chapel" on or before the 20th instant. The lowest or any Tender will not necessarily be accepted.

ST. MARY, ISLINGTON, MIDDLESEX. METROPOLIS LOCAL MANAGEMENT ACT.—The Vestry of this Parish hereby give Notice, that a Committee will meet at the Offices, 21, MILNER-SQUARE, Islington, on WEDNESDAY, the 10th day of SEPTEMBER, 1856, at TEN o'clock in the MORNING precisely, to receive TENDERS for the CONSTRUCTION of about 800 FEET of SEWER, 3 feet 6 inches high and 2 feet 6 inches wide, and other WORKS connected therewith in and along John street, Liverpool-road, in the said parish. The form of Tender (which alone will be received) may be obtained, and specification and plans seen, at the Vestry Office (Surveyor's department), during the hours of TEN and FOUR o'clock. Parties desirous of attending are invited at the time and place above stated, with sealed Tenders, endorsed "Tender for Works in John-street, Liverp'ol road." The Vestry do not bind themselves to accept the lowest or any Tender.

JOHN LEYTON, Vestry Clerk.

21, Milner-square, Islington. 1856.

RUGBY.—To BUILDERS.—Persons desirous of TENDERING for the ERECTION of a TERRACE-WALL of Bath stone and Brickwork, at Calthorpe Lodge, may see the drawings and specification at the Office of Mr. A. B. FREND, Architect, 44, Bedford-row, London.

BOROUGH of LEEDS.—HOLBECK BURIAL-GROUND.—CONTRACT B.—To IRONFOUNDERS and SMITHS. TENDERS wanted for providing and fixing an IRON FENCE and ENTRANCE GATES to the proposed Burial-ground at Holbeck. Plan and specification may be seen on and after WEDNESDAY, the 27th instant, at the Office of Mr. EDWARD TILLOTT, Borough Engineer and Surveyor, No. 16, Greek-street, Leeds. Tenders to be sent to the Town-clerk's Office, not later than TWELVE o'clock at noon, on WEDNESDAY, the 10th SEPTEMBER next, addressed to "The Chairman of the Burial-grounds Committee; Tender for Ironwork."—By order, JOHN A. IKIN, Town-clerk.

Leeds, August 22, 1856.

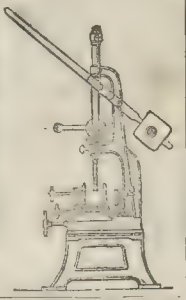
PANCRAS, MIDDLESEX.—The Burial Board of the Parish of St. Pancras in the County of Middlesex, are prepared to receive TENDERS for various ALTERATIONS and ADDITIONS to the CHAPELS of that Cemetery, at FINCHLEY. The plans and specification may be seen, and particulars obtained at the Office of Mr. W. C. BIRCH, Architect, 16, Essex-street, Strand, and sealed Tenders endorsed, "Tender for Alterations," to be left at my Office, Vestry-hall, King's-road, St. Pancras, on or before TWO p.m. on MONDAY, the 22nd inst. on which day and hour the Board will proceed to consider the same.—The Board do not bind themselves to accept the lowest or any Tender. By order,

CHARLES GREENE, Clerk to the Board.

TO RAILWAY CONTRACTORS.—Parliamentary Estimates required for Constructing a Railway of sixty miles in length, now surveying.—Address, L. R. C. care of Messrs. Hooper and Gill, 13 Lombard street, City.

NAILS and IRONMONGERY

From BIRMINGHAM direct

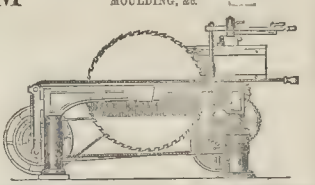


Builders, Contractors, and Others, supplied with Nails, Iron, and Ironmongery of every description, at the

LOWEST PRICES IN BIRMINGHAM PRICES.

A complete LIST of which will be forwarded upon application to BLYTH and BRANCH,

Nail Manufacturers and General Factors, BIRMINGHAM; or at 11, Gresham street, LONDON.



NEW PATENT MACHINE for MORTISING and TENONING HARD or SOFT WOOD and BORING WOOD or IRON.

House and Coach Builders, Joiners, Cabinet-makers, and others, doing similar work, are invited to call at the Patentees', DOWIE, JAMES, and Co. Wholesale Builders and Cabinet Makers, Ironmongery Establishment, 36, Watling-street, City, and see in action this very simple, powerful, and expeditious machine, which is the only one yet brought out, for performing these three separate kinds of work by one machine; and as it is self feeding, it does not require any skill or care in using it—the older inventions introduced. It can either be worked by a boy, or made to go by steam power.

P.S. Steam Engines and Machinery attended to.

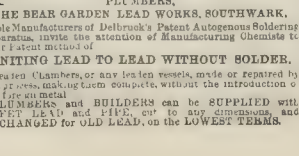
MACHINERY for SAWING, PLANING, MOULDING, &c.

SAMUEL WORSSAM and CO. beg to call the attention of Contractors, Shipbuilders, proprietors of Saw-Mills, and others, to their improved Inventions and Adaptations in Saw Frames and Benches, Roller and Chain Planing Machines, Endless Saw Frames, and all other kinds of Machines, for Sawing, Planing, Grooving and Moulding Wood. They have constantly on hand machinery, either wholly or partly made so that they can at all times on short notice supply them. S. W. and CO. beg to state that they have hitherto confined their attentions to this sort of machinery, and have had the honour of supplying some of the most distinguished companies, shipbuilders, or the trade in the world with their machines, for home and foreign use. One of their Saw Benches, and also a smaller one, with Boring Apparatus, may be seen at the Machinery Department, Crystal Palace. A descriptive Catalogue, with Drawings, may be had on application to SAMUEL WORSSAM and CO. Engineers, &c. King's-road, Chelsea, London.

WOOD-CUTTING MACHINERY, JOHN M'DOWALL and SONS, WALKINSHAW FOUNDRY, JOHNSTONE, near Glasgow. MANUFACTURERS of VERTICAL SAW-FRAMES (driven by straps).

For cutting balks of timber, from 6 feet on the side down to the smallest deal frame.

Patent vertical saw-frames, of the foregoing dimensions, with steam-power attached, circular cross-cut radial sawing machines; power mortising ditto; patent horizontal cross-cut sawing machines, for heavy timber; planing machines, for working boards from a ½ of an inch thick to 6-inch deck plank; revolving planers, for squaring and planing heavy timbers, as used by ship-builders &c.; patent curvilinear sawing machines, for circles, sweeps, and straight cutting, well adapted for ship-builders, power morticing and tenoning machines; moulding machines, for sole and double; veneer mills of all sizes, with all appendages; sole-board machines, for hat-boxes, &c.; patent silent feed motions for saw-frames, and every description of machinery for cutting and shaping timber, all constructed of iron, of the best materials, and first-class workmanship. Mr M'D. and Co. have been the engineering and millwright business for upwards of 30 years, during the last 24 years he has directed his attention particularly to the manufacture of wood-cutting machinery, as evident by the numerous patents he has obtained for its improvement, and by the extensive orders his firm has been favoured with from the British and other European Governments and private establishments in almost all parts of the world; and from their large and commodious premises and first-class plant, made for every department of the works at the lowest rates of cost, the largest contracts can be executed with a regularity, accuracy, and despatch which cannot be excelled by any other firm in Europe. Applications as above for further particulars, will be promptly attended to.



HART and SON, MALLEABLE IRON FOUNDERS, 4, Vine-street, York-road, Lambeth. Orders for Malleable Iron Castings executed within a week.

HART AND SON,

IRONMONGERS AND MANUFACTURERS,

53, 54, 55, & 57, WYCH-STREET, STRAND,

London

DR. ARNOTT'S, SHERINGHAM'S, HART'S, and other VENTILATORS.

First-class Prize Medal, Paris Exhibition, 1855.

Specimens at the Hardware Court, Crystal Palace, Sydenham. Illustrated Lists of prices sent free on application.

TO MANUFACTURING CHEMISTS, PLUMBERS, BUILDERS, &c.

ANDREW CLARK and COMPANY, PLUMBERS,

THE BEAR GARDEN LEAD WORKS, SOUTHWARK,

Sole Manufacturers of Delbruck's Patent Autogenous Soldering Apparatus, invite the attention of Manufacturing Chemists to their Patent method of

UNITING LEAD TO LEAD WITHOUT SOLDER.

Leaden Chambers, or any leaden vessels, made or repaired by this process, making them complete, without the introduction of any fire or metal

PLUMBERS and BUILDERS can be SUPPLIED with SHEET LEAD and PIPE, cut to any dimensions, and EXCHANGED for OLD LEAD, on the LOWEST TERMS.

ECONOMIC COOKING-STOVE.—DEANE, DRAY, and CO. recommend with confidence their IMPROVED COOKING-STOVE to the notice of the public. It is cheap in first cost, simple in construction, easy of management, capable of doing a large amount of work with a comparatively small consumption of fuel, and is manufactured in sizes suitable for large or small families. In operation daily in the store and fender department of Deane, Dray, and Co.'s establishment; where may also be obtained engravings with prices, or forwarded free by post. DEANE, DRAY, and CO. opening to the Monument, London-bridge. Established A.D. 1700.

GURNEY'S WARMING APPARATUS, for CHURCHES PUBLIC BUILDINGS, and PRIVATE HOUSES.—This Apparatus is a modification of that invented by Mr GURNEY the surveyor, and now used by him for warming the House of Commons and House of Peers. It is constructed so as to be available for private houses, churches, and other buildings. It is simple, inexpensive, and powerful the fuel may be coal, coke, or any combining the laws of conduction and convection of heat, to temper and warm air for respiration, without drying or reducing its natural hygrometric state. For further particulars apply to Mr. WOODCOCK, 85, Bessborough-gardens, Pimlico, who will supply the Apparatus, and is empowered to grant licenses for agencies under the patent.

WARMING and VENTILATING.—ALFRED MAY begs to call the attention of Architects, Builders, and others to his system of WARMING by HOT WATER, Lunatic Asylums, Workhouses, Churches and other Public and Horticultural Buildings, Mansions, and Offices.

A. M having had great experience in the above line, is enabled to guarantee the efficiency of such works as may be intrusted to him for execution; he has just completed, to the entire satisfaction of the architects, the warming and ventilation of the Baron's and Sir Anthony Rothschild's new mansions and conservatories

Manufactory, Eagle-street, Red-lion-square, Holborn; and at 50, Devonshire-street, Queen's-square, Bloomsbury.

Artificial heat applies for drying linen on a very economical and effective system.

HEATING BY  HOT WATER.

JOHN WEEKS and CO. King's-road, Chelsea, HOT WATER APPARATUS MANUFACTURERS. Buildings of every description, and of the most extensive dimensions, can be effectually warmed by Hot Water. JOHN WEEKS and Co. can give innumerable references of Churches, Dwelling-houses, Warehouses, &c. &c where they have fixed their Hot Water Apparatus. Also to be seen in extensive operation at their Premises, King's-road, Chelsea.

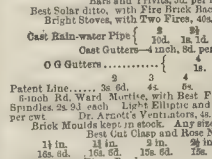
BATHS and HOT-WATER APPARATUS. J. TYLOR and SONS' ILLUSTRATED CATALOGUE of BATH WORK, &c. to be had on application. Estimates and Plans for Fixing given.—J. TYLOR and SONS, Manufacturers, Warwick-lane, Newgate-street, London.

DR. ARNOTT'S SMOKE-CONSUMING GRATE.

Will this Grate become universally used?

Its advantages over every other consist in—

1. A saving of 50 per cent. in fuel.
2. Its being a cure for a Smoky Chimney.
3. Its not requiring one half the attention of an ordinary fire.
4. Its being perfectly safe.



A Prospectus, with a Second Series of Testimonials, just issued, from all parts of the country, will be sent on application.

F. EDWARDS, 80N, and CO. 43, Poland-street, Oxford-street.

TO GAS COMPANIES, FITTERS, and IRONMONGERS. SAMUEL MARTIN, Sole Manufacturer of the PATENT ALBERT GAS-BURNER, begs to call the attention of English and Foreign Gas Companies and the Trade generally, to his large and well-assorted stock of new designs in Gas Chandeliers, Lustres, Brackets, Lanterns, and Fittings of every description, which he is enabled to offer at the lowest market prices, and to execute all orders with the utmost despatch, at his Birmingham, Wolverhampton, and Sheffield Wrought-iron Tube, Gough-square, Fleet-street, London.

SAVING IN GAS.—D. HULETT, INVENTOR and PATENTEE.—The Mercurial Gas Regulator is the only efficient instrument for ensuring wholesome and uniform lighting, equalizing the pressure, and preventing any irregularity arising from the height of the flame.—D. HULETT and Co. 85, High Holborn, London, Manufacturers of Gas Chandeliers, Glass Lustres, &c. &c.

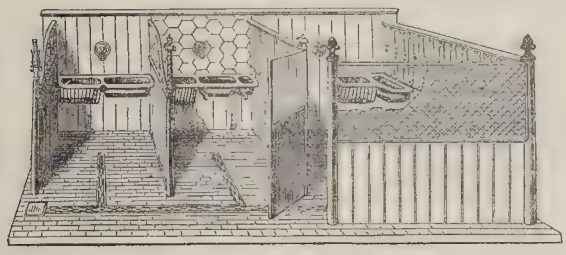
TO ANY DEPTH,
FOR BUILDERS, CONTRACTORS, EXCAVATORS, WELL-SINKERS, &c.
Sizes, from 3-inch to 15-inch barrels.



N.B. The Largest Stock in London for hand or steam-power, and for every possible purpose for which a Pump is required upon the largest or smallest scale in Wrought or Cast Iron, Copper, or Brass.

BENJAMIN FOWLER & CO. GENERAL ENGINEERS, WHITEFRIARS-STREET, FLEET-ST.

NEW PATENT INVENTIONS FOR STABLE REQUISITES.

AWARDED A PRIZE AT THE PARIS EXHIBITION, AND PATRONISED BY THE ENGLISH AND FRENCH GOVERNMENTS.

COTTAM and HALLEN, of Winsley-street,

Are the original inventors of the PATENT ENAMELLED MANGER, WATER-TROUGH, and WROUGHT-IRON RACK, united to an iron top-plate, and forming one complete and useful fixture, having Cottam's Patent Noiseless Halter-Guide and Collar-Rein attached, the ball of which is taken to the back of the manger, and works with ease and freedom up or down the guide-bar. Cottam's new Patent Seed-Box, of privacy & electron, is an important addition to the above fittings, being simple in construction, light and durable, promotes cleanliness, and is economical in its results. Also, the Patent Saddle and Harness Bracket combined, which can be used with great advantage where space is an object, as it can be turned up out of the way when not in use.

Improved Harness Holders, for preserving the shape of the harness, and preventing its cracking. Patent Loose-Box Fittings, Cheap and Durable Corn-Bins.

Improved Surface-Drain, with safety covers, Sanitary Traps, and every article for the harness-room and stable, kept in stock, plain, galvanized, and enamelled. Iron Gates, Fencing, Hurdles, &c.

The new Illustrated Catalogue for 1856, and estimates gratis, upon application to

COTTAM AND HALLEN, 2, WINSLEY-STREET, OXFORD-STREET.

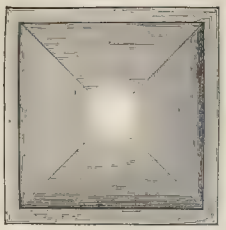
Sylvester and all other Patent Stoves, with radiating hearth-plates. All which he is enabled to sell at these very reduced charges.

Firstly—From the frequency and extent of his purchases; and Secondly From those purchases being made exclusively for cash.

Illustrated catalogues sent (per post) free.
39, OXFORD-STREET; 1, 1A, 2, and 3, NEWMAN-STREET; 4, 5, and 6, PERRY'S-PLACE, London. Established 1820.

TO IRONMONGERS AND THE TRADE GENERALLY.

D. HULETT and CO., Manufacturers of GAS CHANDELIERS, HALL LANTERNS, GLASS LUSTRES, &c. &c. A large assortment of the newest designs always on show—every article marked in plain figures. Patentees and manufacturers of the Mercurial Gas Regulator. Complete pattern-book and price list, 10s.—55 and 56, High Holborn.



IRONMONGERY,

PFEIL AND STEDALL.

THE LARGEST STOCK AT

THE LOWEST PRICE,

5 AND 6, BROAD-STREET, BLOOMSBURY.

Plan and Section of Buckled Plate; Convex Side.

MALLET'S PATENT BUCKLED PLATES.

TUPPER AND CARR,

SOLE LICENSEES AND MANUFACTURERS.

THESE Plates are applicable to every purpose where strong, rigid, light, and durable load-sustaining surfaces are demanded; as for the Flooring of Bridges, Viaducts, Jetties, Fireproof Flooring for Buildings, Fireproof Partitions, Bulkheads, Doors, and Shutters; the Plating in betwixt Iron Piling for Wharf or Dock Walls; the Covering of Iron or other Roofing, as for Building-Slips in Dockyards, for Railway Stations &c. The construction of Iron, Military, Colonial, or other Huts, Stores, and Iron Buildings of all sorts; the Formation of Water-Tanks; the Covering of Reservoirs of Waterworks; and, generally, to every purpose to which Corrugated Iron has been applied, besides many others to which that is inapplicable.—as, for example, the Construction of Balcony or Cantilevered Galleries, Projecting Footways, &c. the Plates deriving their support solely from themselves and the walls

BUCKLED PLATES may be united to each other, or to the frame of the structure they cover, by either lap or butt joints, and either by screw bolts, rivets, or wood screws (to timber), and the joints are made absolutely water-tight when required, by rivetting and chinking up, or by interposed strips of felt saturated in oil cement, or in tar and pitch, or by strips of vulcanised India-rubber, or by a thin layer of oil putty.

The sizes of the Patent Buckled Plates are—4 ft. by 4 ft.; 3 ft. by 3 ft.; 4 ft. by 2 ft.; and 3 ft. by 1 ft. 6in.

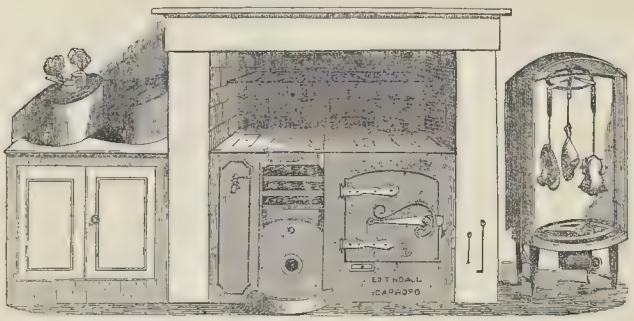
Other sizes by agreement.

For further particulars, prices, &c. apply to the Licensees,—

TUPPER AND CARR,

3, MANSION-HOUSE-PLACE, LONDON, AND 6, BERKLEY-STREET, BIRMINGHAM.

PARKIN AND MARSHALL,



GENERAL MERCHANTS, AND MANUFACTURERS OF

TABLE CUTLERY, PEN and POCKET KNIVES, SCISSORS, RAZORS, ELECTRO-PLATED WARES, FILES, SAWS, EDGE and JOINERS' TOOLS, AUGURS, STEEL, &c. &c.

TELEGRAPH WORKS, SHEFFIELD.

OFFICES—{NEW YORK 71, JOHN-STREET. BOSTON—35, KILBY-STREET, U.S. MELBOURNE 84, COLLINS STREET EAST.

CORPORATE MARK—**XLALL.**—Granted by the Cutlers' Company, 1789.

Messrs. PARKIN and MARSHALL have also pleasure in stating that they are appointed Sole Wholesale Agents for the Sale of the undernamed Articles, manufactured by

MR. ENOCH OLDFIELD TINDALL, IRON WORKS, SCARBOROUGH, viz.:—

TINDALL'S PATENT PORTABLE MANGLES, WASHING AND WRINGING MACHINES, NAPKIN PRESSES, COOKING RANGES, LAUNDRY STOVES, SANATORY TRAP AND GRATE, CHAFF CUTTERS, OAT, BARLEY, MALT, AND LINSEED MILLS, BEAN MILLS, OILCAKE BREAKERS, PORTABLE SAW-MILLS, TURNIP CUTTERS, CULTIVATORS, PLOUGHS, HARROWS, &c. &c.

THE PATENT COOKING RANGES AND ROASTERS are now amongst the most complete and inexpensive before the Public, and are rapidly superseding the antiquated Ranges of our country.

THE IMPROVED LAUNDRY STOVE will heat Fifteen Flats at once, occupies only 12 inches in space, is removable from one room to another, and will be found invaluable in Public Hospitals, Infirmaries, Laundries, and Private Families.

E. O. T.'S SANATORY GRATE AND TRAP is now acknowledged to be the best and most secure from effluvia (as well as not being liable to choke, and easily cleaned) that has been introduced.

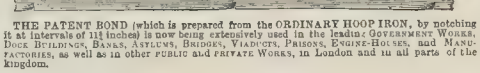
THE MANGLES AND WRINGING MACHINES have been introduced into the Royal Household, most of the Public Laundries, and also into many thousand Private Families, who bear testimony to their efficiency and superiority over all others.

Prize awarded for Mangles by the Yorkshire Agricultural Society, at Rotherham, August, 1856.

THE OAT BRUISERS AND CHAFF CUTTERS, like the above, combine cheapness with the greatest simplicity of construction, and only need to be tried to be appreciated. They effect great saving, and should be in every stable.

N.B.—E. O. TINDALL is the Sole Licensed Manufacturer for the North of England of BUSHE'S celebrated ROOT PULPER and SHELP TURNIP-CUTTER.

Illustrated Catalogues per post, on receipt of twelve stamps.



TYERMAN'S PATENT HOOP-IRON BOND,

FOR BUILDING PURPOSES.

ADOPTED BY SEVERAL DEPARTMENTS OF THE GOVERNMENT.

TARIFF OF PRICES beyond the current Price of Hoop-iron.

Gauge.	In wide.	Per 1,000 ft.
No 16	1½	7s. 0d.
16	1⅝	7s. 6d.
15	1¼	8s. 0d.
15	2	8s. 6d.
15	2½	9s. 6d.

THE PATENT BOND (which is prepared from the ORDINARY HOOP IRON, by notching it at intervals of 1¼ inches) is now being extensively used in the leading GOVERNMENT WORKS, DOCK BUILDINGS, BANKS, ASYLUMS, BRIDGES, VIADUCTS, PRISONS, ENGINE-HOUSES, and MANUFACTORIES, as well as in other PUBLIC and PRIVATE WORKS, in London and in all parts of the kingdom.

Sole Manufacturers—THOMAS PERRY and SONS, Highfields Works, Bilston.

London Depôt—ST. ANN'S WHARF, EARL-STREET, BLACKFRIARS.

FLAVEL'S PRIZE KITCHENER.

The only Kitchen Range which obtained a Prize Medal and special approbation at the Great Exhibition, 1851.

These Ranges are strongly recommended for their simplicity of construction and their economy and cleanliness in use.

The top forms a Hot-plate, and the open fire removes many of the objections which are felt to close Ranges.

They are made in all sizes, from 3 feet to 18 feet in width, suitable for large or small establishments.

They are admirably adapted for the Cure of Smoky Chimneys.

SOLE AGENTS:

JOHN WARNER and SONS, Patentees of IMPROVEMENTS in the MANUFACTURE of LARGE BELLS.

J. W. & SONS having of late years devoted much time and study to the long neglected art of Bell Casting, have recently invented and patented a new process connected therewith, by which they are enabled to manufacture Bells of any size, note, or weight, of superior tone, truer in form, and at less cost than has heretofore been accomplished.

Bells for Churches, Chapels, Colleges, Schools, Turret Clocks, &c. cast for any size, note, weight, singly or in peals.

TUNED BY MACHINERY.

Stocked and wheels ready for fixing. Old Bells recast or taken in exchange.

MUSICAL HAND-BELLS tuned to the Chromatic Scale, with improved Clappers, and pegged on a new system, which give more tone and facility for ringing.

TO ARCHITECTS, &c.—The IMPROVED SELF-ACTING WATER-BAR for FRENCH CASEMENTS, the best and most effectual yet invented, is made by T. SMITH, of 14, Queen street, Oxford-street, near Argyll-street where a working model can be seen or will be sent for inspection on the shortest notice.

N.B.—Espagnolette Bolts of a superior quality, at reduced prices

WROUGHT IRON GIRDERS, Steam Boilers, Gas Holders and Gas Apparatus, General Castings, Chains, Cables, and Contractors' Iron Work, Manufactured by MELROSE and HUSSEY, Phœnix Works, Tividale, near Dudley.—London Office, 73, Hatton-garden.

TO BE DISPOSED OF, a quantity of PILE SHOES and HOOPS, BAR and ANGLE IRON, for roofing, and a WROUGHT-IRON CHIMNEY for a 4-horse engine, 20 feet high, and 3 feet 9 inches in diameter.—Apply to Messrs PATMAN and FOTHERINGHAM, 68, Theobald's-road, Red Lion-square

IMPORTANT to ENGINEERS, MILLOWNERS, &c. — NORTH WOOLWICH ELASTIC STEAM-PACKING Canvas and India Rubber, at 1s. 4½d. per pound (Rings 3d per lb extra), as supplied to her Majesty's dockyards. CAUTION—None genuine unless stamped, thus—

S. W. SILVER and CO.—Works, North Woolwich.

TESTIMONIALS

"Commercial Mills, Crubrook, Manchester, Oct 6, 1854.

"GENTLEMEN,—We have been using almost exclusively, for the last three years, your Packing to our stuffing boxes and steam and water joints, previous to which time we tried all the sorts which came under our notice, but yours we consider decidedly the best and most economical.—We are yours respectfully,

"JOSHUA SCHOFIELD and SONS."

"King and Queen Iron Works, Rotherhithe.

"London Dock, 11, 1854.

"GENTLEMEN,—We have tried your Patent Packing for some time in our steam-engines, and also in steam-pipe joints, and find it effectual and economical, and to be much superior to the ordinary hemp packing. It is especially serviceable in the slide valve.—Yours truly, "HOWARD RAVENHILL and CO."

"Works, Deptford, Jan. 29, 1856.

"I have pleasure in stating that the Packing of Messrs S. W. Silver and Co. has been in use in the various parts of the engines on board the steam-ships of the round by, and is in every satisfaction. "J BLARDMORE, Engineer,

"General Steam Navigation Company."

Copies of further testimonials forwarded, on application to S. W. SILVER and CO. Nos. 3 and 4, Bishopsgate-street Within, opposite the London Tavern.

P. O'CONNOR'S PATENT LEVER HINGE.—The most perfect and simple INVENTION for CLOSING SWING DOORS and GATES yet produced. The motive power being a weighted lever, it may be easily adapted to any size door, and it is not liable to get out of repair, as spring hinges generally are. May be had from all Ironmongers and Factors; J. OARTLAND and SON, Manufacturers, Birmingham; or from the Patentee, P. O'CONNOR, Ironmonger, Wavertree, Liverpool.

MAHOGANY and WAINSCOT seasoned by Symington's New Patent Process.—JOHN COUMBE solicits an inspection of his stock. The above process enables him to season his wood in a comparatively short space of time, he sells at prices generally observed for well worked Timber. ADDRESS, PATENT WOOD SEASONING WORKS, Lady Lake's grove, Mile-end-gate.

FURTHER REDUCTION of PRICES.—SAMUEL PUTNEY has much pleasure in informing his numerous friends that he has made a further reduction in the prices of Pine planks, &c. and respectfully solicits an inspection of his large and well-selected stock of Deals &c

Pine Planks, 12 feet by 3 in. by 11 in. from	£21	0 per 120.
Yellow Battens, from	11	10 "
Yellow Deals, from	20	0 "
Spruce Deals, from	18	0 "

Prepared Flooring, &c equally low. A list of prices forwarded on receipt of a postage stamp.—N.B. All sawn goods delivered within two miles free of carriage. Borough road, Southwark, and Elm street, Gray's-inn-lane.

FLOOR BOARDS, &c.—R. SLADE begs to inform Builders and the Trade, that he has now on hand a large assortment of FLOORING and MATCHED BOARDING, from ¼ inch to 1¼ inches thick, seasoned, and ready for use; also, Mahogany, Moulding, Wainscot, and all kinds of Timber required for Building purposes. Address, R SLADE (late E. Simms), Flooring Manufactory, Wilton-road, Pimlico.

ALFRED ROSLING begs to inform his Customers and the Building Trade generally, that he is enabled to allow a discount of 15 per cent. upon his list prices for Mouldings.—A large stock of dry flooring at low prices.—Southwark-bridge Wharf, Bankside

MACHINE CARVING WORKS (Patent). Ecclesiastical and every other description of CARVING A magnificent Gothic Screen, Carved Glass Frame, and other specimens. Tables, Chairs, Lecterns, &c. Designs and estimates at the Works, Belvedere-road, Lambeth, foot of Hungerford-bridge

LETT'S WHARF PATENT SAWING, PLANING, and VENEER KNIFE-CUTTING MILLS, Commercial-road, Lambeth. The Proprietors beg to announce to the Trade that they have completed their extensive arrangements, and will be happy to execute all orders entrusted to their care with despatch and punctuality. Wet and dry docks and powerful cranes for landing heavy goods, offer facilities not to be obtained elsewhere. A large assortment of seasoned prepared flooring match boarding, &c &c always in stock at reduced prices.

ROBINSON and BARTRAM, SAWING and PLANING MILLS, BELVIDERE-ROAD, LAMBETH, and SWAN-STREET, BERMONDSEY, having completed new MACHINERY for SAWING TIMBER, for building purposes, will be glad to receive ORDERS in this Department and beg to assure their friends that all favours shall be executed in the best manner, and with the utmost punctuality and despatch.

ST. PANCRAS SAWING, PLANING, and MOULDING MILLS, Cambridge-street, Old St. Pancras-road (NEW WORKS), and have the honour to inform Builders and the Trade generally, to their STOCK of DRY FLOORING, at the following prices, for cash:—

¾-inch white, 12s. 6d. per square; ¾-inch white, 15s. per square; 1-inch white, 18s. per square; 1-inch yellow, 15s. per square; 1-inch yellow, 18s. 6d.; 1-inch yellow, 20s.

Timber, deals, planks, &c. at the lowest remunerative prices. A liberal discount allowed on mouldings for exportation. Book of designs forwarded on application.

TO FRENCH POLISHERS, CABINET-MAKERS, BRASS-WORKERS, &c.—A considerable reduction has taken place in the price of French polish, white and brown hard spirit varnishes, spirit lackers, and finishing spirit. The present price is 6s. to 6s. 6d. per gallon; white French polish, 10s. per gallon; white shellac, 1s. 8d. per lb.; gums, shellacs, and acid at the lowest prices. A net cash list forwarded on application to JAMES SLIPPER, 97, Leather-lane; and 14 and 15, Dorrington-street, Holborn.

KENT'S PAINTING-BRUSHES are of the very best quality, and may be obtained at all the first houses in the trade, and of the manufacturers, G. B. KENT and CO. 11, Great Marlborough-street, London. Established 1777.

N.B. Kent's Painting Brushes are all stamped G. B. KENT & CO. Price Lists forwarded by post.

GRAINING by MACHINERY.—The present system of graining is far surpassed by the use of BELLAMY'S PATENT GRAINING MACHINES, by which an ordinary workman can produce first-class work, and at an immense saving of time. The designs are perfect imitations of the choicest specimens of fancy woods and patterns of the first artists.

The Patent Graining Company are now prepared with a large and well-assorted stock of instruments, which they offer to grainers, painters, builders, and others without royalty.

Grained paper in imitation of all kinds of fancy woods of the choicest descriptions, in the press, or in sets for borders, &c. wholesale and for exportation. Pattern-books and cards for the trade in great variety.

The Trade, Grainers, Decorators, Merchants, and others are respectfully invited to inspect the patterns, and see the process at the Company's Offices, 30, Minories, London

WOLSTON'S TORBAY IRON-PAINTS, warranted to stand the action of the Atmosphere, Steam, Gases, Heat as Vapours, Damps, and Salt Water: also interse best without blistering. These Paints have been tested for five years in Her Majesty's Dockyards, and two Official Reports made thereon, which fully that 62 lbs. of Wolston's Torbay Iron Paint will effectually cover as much surface as 112lbs. of either White or Red Lead, and that they resist atmospheric action better than Lead Paints. For all Public Works Galvanized and other Iron Roofing, Fencing, Shipping purposes (Wood or Iron), Stucco and Cement Fronts, economy and durability will be secured. To Builders and Painters, for all priming purposes, the saving will be immense. Manufactured at the TORBAY IRON PAINT and ORE WORKS, Brixham, Devon; London Depôt, Chamberlain's Wharf. Letters or orders will addressed to Mr. WOLSTON, at the Works, or No. 34, John-street, Bedford-row, will have immediate attention.

NEW WINDSOR ESTATE. — Valuable BUILDING LAND TO BE LET, in Plots for first and second class Villa Residences, with stabling, which are much needed in this beautiful locality. The situation is the finest in or near Windsor, adjoining on the Park and Long Walk, and commanding a splendid view of the Castle. Within ten minutes of the Great Western and fifteen minutes' walk of the South-Western Railway Stations. Immediate possession can be had by respectable parties.—For particulars apply to Mr. WILLIAM SIM, Architect and Surveyor, 2, Danes-inn, Strand.

BUILDING LAND, Wanstead-park, Essex. TO BE LET, on Building Leases, for long terms, several PLOTS of highly desirable LAND for villas and other residences in the above park. The land is situate in the immediate neighbourhood of the Woodford and Loughton Railway which is just opened. Plans of the property may be seen, and all particulars and information may be obtained, on application to Mr. CLIFTON, Architect, &c. No. 5, Gresham House, Broad-street.

VALUABLE SITE for BUILDING, TO BE LET, or SOLD.—The Directors of the Western Bank of London are prepared to receive TENDERS for the SURPLUS BUILDING GROUND, in BROOK STREET, adjoining the Bankhouse, in Hanover-square. Particulars may be had on application to Messrs. RYMER, MURRAY, RYMER, and JACKS N, 12, Hanover-street, Hanover square, to whom the tenders may be addressed.

FREEHOLD LAND TO BE LET, on Building Lease for ninety-nine years. Money advanced to responsible parties. Freehold land to be Sold for building purposes in eligible situations.—Apply at the Offices of Messrs. MORGAN and PHIPSON, Architects, 3, Danes-inn, St. Clement's, Strand.

FINCHLEY.—LAND fronting the Regent's Park-road, and East-end-road, TO BE LET on Building Leases for ninety-nine years, with power of enfranchisement. Plots from one to four acres in size, suitable for villas and smaller plots for semi-detached houses, and plots for shops in the village. Apply to W. A. BOULNOIS, Esq. Architect, 8, Waterloo-place, Pall-mall; or to Messrs. BARKER, BOWKER, and PEAKE, 1, Grey's-inn-square.

FREEHOLD LAND TO BE LET, on the river Thames, between the river and the Victoria Docks, being very near the dock entrance, on building leases for 50 years. This land has not only the advantage of river frontage, but it is bounded on the land side by a branch of the Eastern Counties Railway, into which goods may be made. Plans of the property may be seen, and particulars had of Mr. JOHN OAKLEY, Land Agent and Surveyor, 60, Doughty-street; and of Messrs. KINGSFORD and DORMAN, Solicitors, 23, Essex street, Strand.

"	XVIII.	" the Elizabethan period	3 "
"	XIX.	" the Italians	5 "
"	XX.	A series of Leaves drawn from Nature as Models of Ornament	10 "
			100

The Author will endeavour in the several chapters to define the apparent origin, and trace the development of the several styles of Ornament. He will proceed to ascertain the laws which govern their composition, those which are general to all styles and those which are peculiar to each. He will further attempt in the 20th chapter to show how bearing in mind those general laws which have influenced the works of nature and from which all true art has derived inspiration, we may yet go forward, and, whilst availing ourselves of the experience of all time, may be enabled to produce works in harmony with our own times instead of blindly following in the footsteps of the past.

The collection of this vast amount of material has been the labour of many years. On the eve of giving it forth to the world the Author fully feels the difficulty of the task he has undertaken; he trusts, nevertheless, that with this collection, artists, and all others engaged in any way with the decorative arts, will have before them an amount of material which does not elsewhere exist in any such convenient form, and in the use of which it will be his endeavour to serve them as a guide.

N.B. The Letterpress will appear at intervals during the progress of the Work. Size, 8vo. royal.

Published by DAY and SON, LITHOGRAPHERS to the QUEEN, 6, GATE-STREET, LINCOLN'S-INN-FIELDS.

*** *Intending Subscribers are requested to forward their Names immediately.*

PAPIER MACHE AND CARTON PIERRE WORKS,

49, RATHBONE-PLACE.

GEORGE JACKSON AND SONS

Beg the attention of Architects, Builders, Decorators, and the trade in general, to their large assortment of Enrichments for Ceilings and Cornices, in the Gothic, Elizabethan, Italian, Renaissance, Louis XIV. XV. XVI. and many other styles; also rich or simple Panel decorations, Elizabethan and Gothic Dados, Door Trusses, Column and Pilaster Caps, all executed in the highest style of art.

The large and lengthened experience of GEORGE JACKSON and SONS, in decorations of Drawing and Dining rooms, Libraries, &c. for private houses, or public buildings, many of which they have had the honour of executing under architects of the highest eminence, enables them with confidence to direct notice to that branch of their business.

Tradesmen are invited to inspect the large variety of Glass Frames, Tables, Cornices, Screens, Candelabra, &c. The large extent of their works, and the recent adoption of steam power and machinery, enable them to offer very superior advantages in materials and speed, while for design, quality, relief, and finish, they flatter themselves they stand unrivalled.

DESIGNS MADE FOR ANY WORKS.

PAPIER MACHE AND CARTON PIERRE WORKS, 49, RATHBONE-PLACE, LONDON.

M. BLASHFIELD, in Patent impermeable Terra-Cotta, at Millwall, Isle of Dogs; and sold at No. 1, Wharf, Pratt-street, Paddington-basin.

The Builder.

VOL. XIV.—No. 709.

SOMERSETSHIRE is so rich in churches and Mediæval and Elizabethan mansions, that the members of the *British Archæological Association*, during their recent congress, held first in Bridgwater, and afterwards in Bath, have found the excursions full of interest. Somerset is the county of noble towers. Apart from the great churches of Bristol and Bath, St. Mary's at Taunton, St. Mary's North Petherton, the church of Huish Episcopi, Wrington church, Yatton church, Chewton-Mendip church, St. Cuthbert's at Wells, and others, possess towers of unrivalled magnificence and beauty. Representations of many of these will be found in Mr. Wickes's admirable "Towers and Spires," and will well repay study.

A ride through the county is made particularly interesting by this prevalence of towers: the earthworks, too, are not few: the hedgerows are full; and the hills are covered with foliage. All these make a journey in this neighbourhood more than usually pleasing, and the pleasure is increased by the connection between the locality and events in the early history of the country, more particularly with Alfred the Great and his defeat of the Danes. It was on the Isle of Athelney, within a few miles of Bridgwater, that Alfred, leading a troubled life, as Asserius writes, in the forests and marshes of Summurtune county, took up his abode in the cottage of one of his cow-herds, and let the cakes burn. Here, some time after, he made a stronghold, and, with the men of Somersetshire and Wiltshire, ultimately defeated the Pagans, and forced them to leave the country; their king, Godrum, or Gurtharum, agreeing to become a Christian and receive baptism. This ceremony was performed a few weeks after the battle; Alfred acting as his godfather, at the church of Aller, close by. The decisive battle was fought at a place then called Ethandune, or Edendune, and has been claimed for Edington, in Wiltshire. During the meeting of the Association in Bridgwater, Mr. Gabriel Poole, a local antiquary, in an interesting paper, made out a very strong case for a place called Eddington, in Somersetshire, about six miles east of Bridgwater, and which certainly seems to accord better with the account left by Asserius than the Edington in Wiltshire. Mr. Poole said, justly, that as the great events referred to had been mainly brought about by the valour of the men of Somerset, he felt that, as their descendants, they ought, on such an occasion as this, to bring to mind the great deeds of their forefathers; and that, if these events took place in the neighbourhood of Bridgwater, they ought not to allow themselves to be deprived of the honour of calling them their own, unless some other county could show a better right to them.

Bridgwater, where the meeting we are speaking of took place, is situated on the river Parret, about six miles from its mouth. It is an ancient town, though most of the evidences have been removed, and is peculiar as the only place in the kingdom where the well-known bricks for scouring purposes, known as Bath bricks, are made. Why they have this name is not known. It would seem that a mixture of sand from the sea with the alluvial deposit of the river, is here formed naturally, to the extent of about half a mile above the town bridge, and half a mile below it. The works are situated on the banks of the river, so that the sediment is taken at once to them, and being dried and formed into shape, is then burnt in kilns hard by. The manufacture employs from 4,000 to 5,000 hands.

There was a large castle in Bridgwater anciently: its site is now occupied by King-square. A drawing belonging to Mr. Heard, which was exhibited, with a number of other views of the old town, at the Assize Hall, showed that there were considerable vestiges of the castle within fifty years ago. At present all that remains is a postern gate in some premises on the quay. The parish church, St. Mary's, an interesting edifice, with a lofty spire and tower at the west end, has been restored with the exception of the tower, in consequence of which omission there is an ugly mass of masonry inside, that spoils the appearance of the church viewed from the east end. The east window is blocked up internally to afford a position for a large picture of the Descent from the Cross. The works of restoration appear to have been exceedingly well performed. The north doorway, a beautiful specimen of the Geometrical period, and untouched, is peculiar in its arrangement. A flat, pointed, arch is introduced for the doors to shut against, and the space between that and the point of the equilateral main arch above is filled with open geometrical tracery (a circle with quatrefoils, trefoils, &c.), to light the porch. The end of the north transept, too, where, next the ground, there are recesses with monumental effigies, and a door between, is very picturesque. The body of the church is mostly Perpendicular.

At the opening meeting, Mr. Pettigrew read a comprehensive and pleasant paper on the

Antiquities of Somersetshire;

in the course of which he said:—The primeval antiquities of Somersetshire are either few in number or have been scantily reported. Collinson, the historian of the county, writes, under the head of Celtic antiquities, simply the mention of Hantrille's Coit, a large stone, evidently belonging to an ancient cromlech, and estimated to have weighed not less than thirty tons. Mr. Collinson describes it as standing in an inclosure north-east from the church, and forming part of the remains of four assemblages of large ponderous stones, forming two circles, an oblong, and an ellipsis. The first, or large circle, part of which is crossed by an old hedge-row, is westward from the other parts, and is 300 feet in diameter, composed of fourteen large stones, some of which are fallen, and lie flat upon the ground: the second circle eastward is 84 feet in diameter, and consists of eight stones: the oblong, consisting of five stones, stands between the two circles, but rather inclining to the south; and at the southward extremity of all is the ellipsis, which is 40 feet in length, and has seven stones, one of them placed, as it were, centrically, and out of the line of arrangement. The stones which form the second or inner circle are the largest; one of those on the west side being 9 feet high and 22 feet in circumference, and would, upon a calculation, weigh upwards of fifteen tons. Dr. Stukely has regarded the work as the remains of a Druidical temple. The usual opinions connected with this subject have indeed been entertained and supported. The place has derived its name from the erection, as it is called Stanton, from *Stean* a stone, and *ton* a town; and from its ancient roads, Stanton Drew, whence, from its situation, the proverbial rhyme,—

"Stanton Drew,
A mile from Pensford, and another from Chew."

Sir Richard Colt Hoare, Bart., in 1817 transmitted to the Society of Antiquaries an account of a barrow in the parish of Wellow, at Stoney Littleton, denominated by him as the stone barrow, agreeably to its internal mode of construction. It measured 107 feet in length, and 54 feet extreme width, and was 13 feet in height.

In Roman antiquities, Somersetshire is exceedingly rich, every part of the county appearing to be capable of yielding examples illustrative of its occupation by the Romans. Villas have been discovered, and pavements excavated. There are examples at Wellow, Coker, Pitney, Hurcot, and Wadford; but most of these have suffered serious mutilations. Archæological societies were not at the time of their discovery in active operation as at the present period, when, we trust, more decided measures would have been adopted for their preservation.

The churches of Somersetshire may, in general terms, be said to offer to us splendid examples of the fully developed crucial form, with a central tower. The churches specially deserving attention, and of which several particulars have already been recorded in the Proceedings of the Somersetshire Society, are Uphill Old Church; St. John the Baptist, Wellington; St. Mary, Taunton; Lullington Church; St. Cuthbert, Wells; St. Mary, Kingston; Stoke-sub-Hambdon, and Somerton. The Somersetshire churches, in general, are remarkable by the absence of aisles (except in very large buildings, as St. Cuthbert's); by the frequent presence of transepts; by the octagonal form of their towers, and by the abundance of cruciform specimens. The churches which, in the course of our congress at Bridgwater, we shall be able to inspect, are those of Bridgwater; St. Cuthbert's, Wells; Martock; Stoke-sub-Hambdon; Montacute; Brympton; Yeovil; Clevedon; Walton; Weston-in-Gordano, and Tickenham. St. Mary, Bridgwater, is large and handsome: it has nave, chancel, two side aisles, and a tower at the western end, upon which is a lofty spire, so that the tower and spire measure 174 feet in height. St. Cuthbert's, at Wells, is a church of the Third Pointed Period, but some portions of it are earlier. Its tower is generally esteemed to be the finest in Somersetshire. Frescoes were discovered in it in 1851, the most finished of which was a life-size figure of the Saviour, clad in a russet-coloured garment, with a red cloak on his shoulders. In his left hand was an orb, surmounted with a cross: his right was used in benediction: his feet were bare: Ꝺ℘e m'cy was ten times repeated on the ground of the fresco, at the foot of which was written *Salvator Mundi*. Martock Church is distinguished by its magnificent nave, which is very long, with six bays. As a whole, it is entitled to the highest commendation, and the effect is strikingly agreeable: the relief one part affords another, and the various effective combinations, proclaim the evidence of design, and entitle the architect to praise.

At the same meeting Mr. Black gave the corporation (as well as the meeting) much gratification by an examination and report on

The Municipal Records.

Taking the parchments in the order in which he found them, he produced an ancient charter of one of the early kings—Edward I.—and others, reciting the inspection of the former charter, and confirming its stipulations. The charter was granted to one William Brewer, of the town of "Burgewater," and it provided that the town should be a free borough, with a free market, and a free fair to last eight days, the burgesses to be free of "lastage and stallage throughout our whole land except the City of London." Next he found a charter of Edward II. confirming this grant; and another further confirming the charter by Henry III. "King of France," &c. dated in the "45th year of our reign, and of our reign of France the 32nd" (1372). In the charter granted by Edward IV. it was stated that complaint had been made to the king that "from ancient time the town has been accustomed both by foreigners and natives of this country, and used for all manner of merchandize; and whereas the town had fallen into great ruin and decay, by want of reparation, so that the merchants had withdrawn themselves and failed to come with their ships to the port;" and this grant was for the purpose of restoring the town to its former degree of prosperity. To accomplish this, the boundaries of the borough were extended in a remarkable manner, the confines of the town being duly set forth in

the charter. He laid before the meeting some other interesting documents, such, he observed, as it seldom fell to the lot of an antiquarian to unfold on such an occasion. These consisted of rolls found among the muniments in the corporation chest, containing the principal accounts of the churchwardens—which were not usually met with among corporate deeds. The town was described as the "town or borough and parish of Bridgwater;" and from these documents it would seem that the corporation had considerable right and power which they exercised over the ecclesiastical affairs of the town. On one of the rolls he had seen that morning the cost of erecting Bridgwater tower—the material and the cost of labour; and what was more important still, had ascertained the time it was built, a circumstance now made a matter of certainty, instead of mere conjecture and speculation. At a meeting in the evening, he pointed out particularly an Exchequer taxation roll, which he said contained the name of every place in each hundred of the county, and the amount of taxation contributed by them. The whole sum for the county was 1,357*l.* 19s. 2½d. of which Bath was assessed at 13*l.* and Bridgwater—showing it to be a place of great importance at that period—at double the amount.

At the same meeting, Mr. G. Parker read a paper on the

Local History of Bridgwater.

The first notice, Mr. Parker said, we have of Bridgwater, is from Doomsday-book. At the time of Edward the Confessor, A.D. 1041, Bridgwater was a private estate of Meile Swain, a Saxon Thayne. He lost it at the conquest, when William the Conqueror gave it to one of his followers, Walter de Dowai, from whom the place derives its name.* His descendants conveyed the lordship of Bridgwater to William Briwere, and King John confirmed to him the manor with the Knights' fees, advowsons of the church, and granted him an ample charter, making it a free borough, with a free market and a fair, and gave him licence to build a castle.

The Briwere family built and endowed the hospital of St. John (the charter of which was dated 1214), for a prior, master, and brethren of the order of St. Augustine, who were to superintend and maintain thirteen poor and infirm persons, besides religious men and pilgrims. William de Briwere made the haven of Bridgwater, and commenced the stone bridge afterwards finished by Sir T. Trivet. The castle and third part of the manor of Bridgwater became vested in the crown about the time of Edward IV. In 1626, Charles I. granted to Sir Wm. Whitmore the manor and castle of Bridgwater. The Whitmores sold it to Henry Harvey, of Bridgwater, who leased it in 1643, two years before the siege of the town by Fairfax, to Edmund Windham. Mr. Parker then gave an interesting account of the siege of the town by the Parliamentary forces, principally taken from Oldmixon's history of England. Oldmixon was a native of the town, and relates that he himself saw Monmouth leave the town for the fatal battle of Sedgmoor. Reviewing the history of the town, Mr. Parker described the old buildings, drawings of which were exhibited in the museum. Within the last century nearly every shop was without glazed windows. Mr. Parker described the sites of the old crosses and gates, and stated that some of them existed during his remembrance. He pointed attention to the house now in his possession, where Admiral Blake was born.

The next day, when the members went to

Glastonbury,

a paper, by Dr. Beattie, on the Abbey there, was read by Mr. George Wright. "Amongst the noblest structures ever raised by man for the worship of his Maker," said Dr. Beattie, "the church of Glastonbury was for ages without a rival. It was invested with a holy tradition that claimed for it the immediate protection of Heaven. Guardian angels, it was affirmed, stood sentinels at its gate, and, like the Seraphim of old, hovered with expanded wings over its altars. It was regarded as the first hallowed spot—the very Zion of the Christian Church in England. The soil on which it stood, the skies through which its spires pointed the way to Heaven, were pronounced richer and lighter than those of any other land—those of Nazareth only excepted. Pilgrims, as they approached the hallowed precincts of Glastonbury—so tradition affirms—were met and welcomed by angels, whose never-ceasing 'hallelujahs' were heard and felt in the heart of every believer,—

'——— Kindling his faith and lifting up
His new-born hopes to heaven.'

The legend, historical as well as popular, which commemorates the founding of Glastonbury, attributes it to no less a personage than Joseph of Arimathea. * * * After the spirit of Christianity had been successfully propagated among the surrounding natives, the modest cell which Joseph had erected with *his own* hands, was replaced by a solid structure, which Ina, King of the West Saxons, presented to the brotherhood. This edifice, on which the king had bestowed all possible care, by selecting workmen qualified for the task, is described as a very fair and stately church, dedicated to Christ, St. Peter, and St. Paul. Thus substantially housed and patronized, the brotherhood of Glaston rapidly increased in numbers and influence. * * * In the reign of King Lucius, two delegates from Pope Clutherius were sent to make a survey of the rising church of 'Ynswyton,' as Glastonbury was then called, and, among other restorations and additions to the original cell, on oratory was erected on Mount Thor. This temple they dedicated to the archangel Michael, that, being so 'honoured by men on earth, he might, by God's command, bring men to honour Him in Heaven.' In the year 430, the church was visited by St. Patrick, who took up his residence there, rebuilt the chapels of St. Michael and the Blessed Virgin, and, after conferring many benefits on the place, spiritual and temporal, was succeeded by St. Benignus, who softened the name of Ynswyton into that of Avalon. In 530 the sacred edifice was again enlarged and embellished by the Bishop of St. Davids, uncle of King Arthur; and when the renowned prince was mortally wounded at Canslan, he was carried hither with great solemnity to receive the last consolations of religion, and a grave in hallowed ground. His remains were long afterwards disinterred by Abbot de Levansey, and reburied in the presbytery.

"In 665, St. Augustine incorporated the brotherhood of Glastonbury into a regular monastic institution, with an Abbot at their head, and governed by stringent laws and regulations. In 708, King Ina, who had declared himself, as already noticed, the great patron of Glastonbury, supported his title by many gifts, also of princely munificence, to the monastery. Among numerous other donations of precious utensils, he gave for the use of the chapel and altar no less than 264 pounds weight of gold, 2,640 of silver; and to these he added an extensive territory, still known as the jurisdiction of Glastonbury, and consisting of seven parishes. His nobles, following the example of their prince, vied with one another in their benefactions and posthumous bequests. Thus patronized, the Abbey became proverbial for its riches. Not a pilgrim entered its holy precincts, but returned home with exaggerated reports of its splendour. These accounts, stimulating the cupidity of barbarous enemies, brought frequent ruin upon the monastery. Danish and other marauders were seen at its gate: fire and sword demolished the buildings, dispersed the monks, and stripped the treasury of all its sacred wealth. But no sooner was the calamity passed, than the brotherhood re-assembled, the church was re-edified, and in a few years Glastonbury not only revived, but exceeded its former splendour."

The Association, after visiting the ruins of Glastonbury Abbey, examined the beautiful architecture of

Wells Cathedral.

The visit was rendered still more agreeable by the courtesy of the Bishop of Bath and Wells. Lord Auckland not only threw open the episcopal palace and grounds to the members of the Association, but kindly accompanied them in their visit to the Cathedral, the Chapter-house, and the Refectory.

In the Chapter-house Mr. Pettigrew read a paper on the Cathedral, embodying a communication on the building from Mr. Britton.

On the subject of the gorgeous display of ecclesiastical sculpture on the west front, Mr. Pettigrew quoted the opinion of Mr. Britton, who considered that the intention of the architect of this venerable pile was to surpass all preceding works of the kind—producing in fact, a sort of "miracle in art," and thus exciting in the mind of the beholder wonderment and devotion. Flaxman, whose pure taste in art will ever entitle him to a high place in the grateful remembrance of all lovers of classic sculpture, characterized the sculptures as presenting the noblest and most useful subjects that could possibly be chosen. Comparing the difficult circumstances under which the work was executed, in comparison with our own times, it was remarked that, in those days, there were neither prints nor printed books to guide the judgment and discretion of the artist; there were no glimmerings of anatomy, of optics, or perspective, which were reserved for the researches of so sublime a genius as Roger Bacon, many years afterwards. Professor Cockerell's deductions on the subjects portrayed in the figures which adorn this part of the building, were considered at some length, and his opinion stated. According to that gentleman, these sculptures were designed to illustrate, in a striking manner, the great and fundamental doctrines of the Christian faith, its happy advent to this country, and its subsequent protection under several dynasties until their execution, A.D. 1214. Mr. Cockerell, who in his investigations had the co-operation and assistance of the late Dean (Dr. Goodenough), ascertained that the stone used was from the Doulting quarries, near Shepton Mallet, and that they were executed by English workmen.

Some of Mr. Cockerell's suppositions were warmly disputed.

In the Bishop's Palace are the remains of the vast "Guesten Hall," the chapel, and other old parts of the edifice, together with the fortified walls, bastion-towers, machicolated gate-house, and other characteristics of a castellated mansion. The deanery contains some curious architectural remains, particularly a fine chimney-piece in the hall, a bay window, and other objects of curiosity. These various buildings, as well as the vicar's close, are illustrated in the Picturesque Antiquities of English Cities, and the latter especially is amply described and displayed by Mr. T. L. Walker.

We shall not pretend to give a complete account of the week's work, but must confine ourselves to a few salient points likely to interest our readers. As a sample, however, of the excursions, we may note something of what was seen on the third day, Wednesday, when a numerous party started early in the morning, and made a descent on

Martock Church.

This is for the most part of the Perpendicular period, and is noticeable for a very handsome open roof, reminding the visitor, by the extent of its decoration, of some in Norfolk: it has also a range of handsome niches on each side of the nave, above the spandrills of the arches separating it from the aisles. Some coarse paintings of figures *adorn* them. A handsome Early English window of five lancets, at the east end of the chancel, is shut off by a huge pseudo-classical composition, in plaster, of columns and entablatures, altogether incongruous, and serving by its ill-proportioned scale to lessen the apparent size of the church. A hope was expressed that it would be removed, and the window opened.

There are three interesting mediæval effigies, the size of life, placed over modern graves outside: these should be placed under cover.

The remains of the Manor-house at Martock include the hall, with a good roof of open timber, and the kitchen at a short distance

* Qy. Burg. Walter.

from it, connected at one corner with the solar and offices. The windows of the hall, of two lights, with trefoiled heads and a transom, have a cinquefoiled inner arch. A carved stone bracket projects from each side wall, the purpose of which is doubtful. These may even have been built in afterwards. The kitchen retains its ancient fire-place and hatch.

Stoke,

The next place stopped at, is remarkable for the number of good stone cottages of the sixteenth and seventeenth centuries which it exhibits, and very considerable remains of monastic buildings. The church is a Norman structure, with various insertions, and a south chapel of the Early Decorated period, with a range of four lights on each side. A low side window (sometimes called a lychnoscope, and sometimes a vulne window), on each side of the chancel; a squint, or hagioscope, on each side of the chancel arch; and what may be the remains of a stone altar, at the end of the chancel, are amongst the noticeable points. On the south side of the latter there is a large piscina, with shelf above, placed anglewise. The most interesting feature in the edifice, however, is the north door of the church, against which, in more recent times, a porch has been built that obscures the upper part of the ornamented semicircular arch. On the semicircular tympanum, above the straight head of the door, are various rude sculptures, consisting of a tree in the centre, with three large birds amongst the foliage: on the left, or east side of this, is a representation of the archer of the Zodiac, marked at the side, in Byzantine fashion, Sagittarius, and on the other side an animal inscribed Leo, and a representation of the Agnus Dei. The capitals of the columns are leafed, and the shafts are ornamented: the arch displays the zigzag and fret. This doorway would seem to belong to the end of the eleventh or the beginning of the twelfth century. King Stephen, who reigned from 1135 to 1154, bore Sagittarius as a device.

The cill of a window on the south side of the nave projects to throw off the wet, an arrangement not usual in Mediæval work.

Montacute

is a very picturesque village, and offers attractions in the shape of the gatehouse of the old priory, and the residence of the Phelipses, Montacute House. Both the gateway and the residence have been illustrated in our pages, so that we need do nothing more than refer to them.* The hall contains a stone screen, of which we have given an engraving elsewhere; and at the opposite end, on the wall, a large bas-relief, of rather coarse execution, of Stang-riding, or Riding the Skimmington, a mode of punishing certain delinquencies, or of ridiculing a man who allows his wife to beat him, still followed in some parts of the country. It consists in making him ride a wooden horse in procession, with the accompaniment of much noise. One end of the bas-relief shows an interior where the husband, who has visited the beer barrel, having accidentally pulled out the spigot, has been forced to put his finger in its place to prevent the waste of the beer, and being so discovered by the wife, is receiving a castigation: the other half displays the mock procession. The garden at Montacute,

"Walled al with stou,"

with its balustrades, steps, fountain, terraces, and stone summer-houses, is charming in the extreme: a delicious "pleyng place," to step into from my lady's "bowre."

The inscription over one of the entrance-doors,—

And yours, my friend,

would be very satisfactory if it were true.

* See vol. iii. p. 387; vol. vi. p. 42 (view of the stone screen in hall); vol. vii. p. 330, &c.

According to the guide-books, including Murray's excellent new one, Montacute has its name from the sharp-pointed hills near, *Mons acutus:* others, however, would rather find the derivation in the fact, that William Earl of *Mortaigne,* in Normandy, founded here, in the latter part of the eleventh century, a priory of black Cluniac monks. The gateway of the priory, built at a later date, we have already mentioned.

From this pleasant spot, the party proceeded to

Brympton,

where the church, the residence, and a mediæval domestic building, supposed to have been the residence of a chantry priest, form a most interesting group. In the churchyard there are some large stone effigies, of the fourteenth and fifteenth centuries, on which Mr. Planché, who did good service during the week, made some observations. One, a female, has the half-moon head-dress: both should be removed under cover, in order to preserve them. The bell-cot, overhanging the base on all sides, is more peculiar than pleasing. The principal front of the mansion, which presents Italian architraves, window-caps, cornices, &c. with the mullions and transom of the Tudor period, has been ascribed by Walpole and others to Inigo Jones, and probably with truth. In our fourth volume (p. 31), will be found some details of the stable here, said to be also the work of Inigo. A portion of the manor-house belongs to the reign of Henry VII.

From Brympton

Yeovil

is but a short ride, and there, after viewing the church, the tower of which stands grandly, the archæologists had an opportunity of seeing a collection of ancient and modern works of art which had been exhibited for some time past in the Literary Institution there, and is now closed. It contained a number of good pictures, and some very curious works of art of other sorts; for example, a cabinet of medallions, ascribed to the fourteenth century, representing the sculptures on the triumphal arches in Rome, and which ought to go to the forthcoming Manchester Exhibition. There was a small part of a shrine from Glastonbury, which deserves illustration, and we may mention a portion of a metal 2 feet rule, or guage, found in the walls of the tower of Yeovil Church, and sent by Mr. Shout, the architect.

Let us say, as to the church, that the interior, which is of noble proportions and of the Perpendicular period, is sadly disfigured with white and yellow wash. A brass lectern here has a quaint and contracted Latin inscription.

A luncheon at Yeovil, a dinner at Bridgwater in the evening, and then two papers in the Town-hall, one by Mr. Vere Irving, on "Earth-works," and the other by Mr. French, of Bolton, on "Rayed Banners and the earliest Armorial Charges," ingenious if not correct, completed the business of a long day. And here, with a hint to the very liberal and enlightened corporation of Bridgwater, that the aspect of their Assize Court, looking up at the ill-arranged heap of timber which forms its roof, is scarcely worthy of them, we must close our present notice.

ON THE DRYING AND BURNING OF BRICKS.*

FOR burning bricks, we have to employ the utmost care and attention in exposing them to as high a heat as they can stand without endangering their melting. If they are not sufficiently burnt, they will be very absorbent, and will retain sufficient moisture for a frost to destroy them.

The burning is carried out on two principles. First, in the neighbourhood of London and Manchester, by what are termed close fire clamps; that is, with as little draft as possible, or by a smouldering fire which occupies a month or six weeks in burning, having the fuel spread in layers between the bricks. The other system is by a draft of hot air or flame from furnaces or fire-holes in square or circular buildings, called kilns.

* See p. 467, *ante.*

Of these there is an endless number of constructions; some nearly approach the close fire clamps, having a very low draft, and take a week or nine days to burn them. Others have an increased draft, and take four or five days; and the more recent constructions effect the desired object in from forty-eight to seventy-two hours.

The close fire clamp is the favourite system around London and Manchester for burning bricks, which arises from these large populous cities supplying the brickmaker with a very cheap fuel in the shape of the refuse ashes from the houses and the manufactories, and also from the clays in these districts taking little fire to burn them. The London makers not only burn by layers of the ashes between the bricks in the clamp, but, as I before mentioned, add in the making about 30 per cent. to the clay before it is moulded. Around Manchester, ashes are not used in making the bricks, but only in burning them. I think it quite superfluous to describe the setting or constructing these clamps: it would occupy much time, and the fewer we have of them, the better bricks will be supplied. But the principle is to stack the bricks close together, and to check the draft as much as possible, the fuel being intermixed with the ware. The wind is often very troublesome with clamps, and drives the fires to one side, by which that is over-burnt and the other side almost useless from not being burnt enough. I have not had any experience in these clamps myself, but I am informed by those practically acquainted with them, that the inferior (that is, the over and under burnt) bricks are often in a proportion of from 30 to 50 per cent.; and these have to be sold at a reduced price. This irregular firing produces the numerous qualities of bricks which I described in my previous paper. All are made equally well, but are destroyed by the unequal heats to which they are exposed. The heat at which the bricks are burnt varies in the London close fire clamps from 5 to 20 degrees. That the close fire clamp is the worst system of burning bricks few can doubt; and it would not be so tenaciously adhered to around London and Manchester, but from the supply of ashes being so great and so cheap. As a proof that the system is not good, the brickmakers in the collieries all use kilns, even where they have in their works refuse coal free of cost. But they cannot sell their bricks unless they are of good quality: they therefore use the kiln with a quick draft.

On visiting the brickworks at Epsom a few weeks since, to inspect the kiln which I have described to you, I was quite convinced that my opinion was right with respect to close fire clamps. The bulk of the bricks made in these works are burnt in the clamps, and a portion in the kiln. The most casual observer could not but be struck with the difference of the ware. Before I leave the subject of close fire clamps, I might mention that the London ashes could still be used by their being ground up fine amongst the clay; and then a very small quantity of fuel in the furnace of an improved kiln would burn the bricks of one uniform quality, and enable the waste heat to be economised for drying the green ware. The ashes, as they are now used, have their particles too large; and these, on being consumed, leave the bricks full of cells, and less compact and solid than other bricks.

The burning kilns are generally rectangular brick constructions, either open at the top or arched over, but some are circular buildings, or cupolas, called "ovens." It would take a whole evening to describe every one, and the different systems adopted in each: I will, therefore, only briefly explain the burning of an improved square kiln, and of a round one. The construction of the kilns cannot be correctly explained without drawings. The square kilns for large works, as erected by Mr. Beart, are built in pairs, to save one wall: they have the furnaces along one side, and the centre wall supports

two arches of the kilns. When they are thus built together, one is burning while the other is being discharged and filled, the cool kiln acting as a buttress to the burning one. The late Dr. Cother, of Gloucester, built a pair of these kilns under one arch. The bottom of the kiln is constructed with furnaces every 5 feet from centre to centre, and built with fire bricks. Above the fires, and about 5 feet from the bars of the furnace, is the floor of the kiln, supported on walls running through the length of the kiln, about 4 inches apart, and in these walls are arches at each furnace. The walls are tied together by the lattice-work of the floor of the kiln, and the ends of the bricks, forming the open floor, are kept about 3 inches from each other. Through these small holes the flame from the furnace enters the goods to be burnt. The height from the open floor to the top of the arch is about 15 feet, and the vertical walls are from 12 to 14 feet apart. Thus a large space is allowed, as they can be built of any desired length. These kilns are constructed to hold from 50,000 to 200,000 bricks each, and are capable of being burnt from eighteen to twenty times in a year. The arches of the kilns have a row of small chimneys, about 3 feet high and 5 feet apart, built down the centre, and a similar number on each side, through which the waste heat and gases escape.

The first process is to fill the kiln, which is called "setting." The bottom rows of bricks are kept wide apart over the floor, to allow the flame to enter more freely. On these are placed one or two rows of bricks, crossing the course on the floor, and about ¾ of an inch apart. Every one or two courses are then crossed, so that the fire has to pass through a series of network, formed in the setting of ¾-inch squares. When the kiln is filled, the entrance, called the "wicket," is built up close with burnt bricks, and plastered over with loamy clay. The fires are then lighted in the several furnaces, and for twenty-four hours are allowed to burn very gently, but gradually increased, air being admitted, that the draft or warm current may drive off the steam as fast as it is formed, for bricks cannot be *thoroughly* dried previously to their being stacked in the kilns. When the steam ceases to flow from the top chimneys, the fire is gradually increased, and the heated gases flow with greater velocity through the ware. At this time the judgment of the burner is called into requisition, for if his furnace should become too hot, he may vitrify the bottom bricks, while those at the top of the kiln, 20 feet from the fire, would be quite unburnt. This he prevents by opening his furnace lids, and allowing a current of air to enter sufficient to cool his furnace. He then again closes the lid, in order to attain what heat he can safely use. These operations of heating and cooling are continued until, on looking at the top chimneys of his kiln, he sees that he has attained a sufficient heat. After this he gives the kiln a few hours more fire, but gradually admitting more air, which begins to lower the temperature of the bottom part, and, from the increased draft, carries the heat to the arch, and thoroughly burns the top bricks. I have often seen these top bricks, 20 feet from the fires, harder burnt than those on the floor of the kiln, within 5 feet of the fire. After the burning is completed, the fire doors are shut to prevent the kiln cooling too rapidly, and for two or three days it is pouring off to *waste* an immense amount of heat, free from all impurities. When the kiln is cool, the wicket is taken down, and the ware drawn out for use. With a good burner the bricks will all be of equal quality, and, if well made, will all command the highest price, not a moiety only, as in clamp-burnt bricks.

The common brick-kiln is a rectangular building, generally open, but sometimes arched over. In the side walls and opposite to each other are built fireplaces, or holes for the insertion of the fuel. The furnaces are formed in the setting of the kiln with unburnt bricks, and above these the kiln is filled as above described. In these kilns, from the raw ware forming the furnace, the flash of the flame from the fires in the walls too often vitrifies and destroys the nearest bricks. In the open kiln, as the fire or heat reaches to the top, the fireman soils or earths it down, which throws the draft to another part more backward; and, as it continues to rise, he proceeds with this operation until all the top is earthed in: he then continues the firing until the whole has sunk, by the contraction of the clay in the fire, to the desired depth. The fire-holes are then stopped up with mud, and the kiln is left to cool gradually. If the air were admitted too rapidly while the kiln was at this intense heat, it would cause bricks made with strong clays to fly to pieces like glass: it is, in fact, the process of annealing. Cooling too quickly also affects, in many clays, the colour of the bricks.

Temporary kilns are constructed in the country with unburnt bricks, and called clamps. In Staffordshire, the bricks are burnt in small round kilns, called ovens, which hold from 7,000 to 8,000 bricks each: these are burnt from fire in the walls round the ovens, and the raw ware is set in, so as to form a flue from each fire, to direct the flame to the centre. These ovens burn very quickly, and a most intense heat can be obtained in them.

I will now more fully describe a principle of burning which I have had in practice for the last six years, and which I can therefore recommend with great confidence. The great object in brick burning is to attain a sufficient heat to thoroughly burn the ware with as small a consumption of coal as possible; and with nearly an equal distribution of the heat over all parts, so that the whole of the ware, being subjected to the same temperature, may contract equally in bulk, and be of one uniform colour throughout. The advantage is also gained of burning in much less time than in the old kilns, which, on an average, took a week; and the management is so simplified that any man, even though not at all conversant with the manufacture, after he has seen one kiln burnt, will be able to manage; and the last, though not least, advantage is, that of delivering up to us the waste heat at the ground level, or under the floor of the kiln, to be used in drying the green ware, or in partially burning the next kiln.

Hitherto the heat has been applied by a series of fire-places, or flues and openings round the kiln, each exposed to the influence of the atmosphere; and in boisterous weather it is very difficult to keep the heat at all regular, the consequence of which is, the unequal burning we often see. The improvements sought by experimentalists have been the burning the goods equally, and, at the same time, more economically. These are obtained by the patent kilns, as improved by Mr. Robert Scrivener, of Skelton, in the Staffordshire Potteries. The plan is both simple and effective, and is as follows:—A furnace is constructed in the centre of the kiln, much below the floor level, and so built that the heat can be directed to any part of the kiln at the pleasure of the fireman. First, the heat is directed up a tube in the centre to the top of the oven or kiln, and, as there is no escape allowed to take place there, it is drawn down through the goods by the aid of flues in connection with a chimney. Thus, all the caloric generated in the furnace is made use of, and, being central, is equally diffused throughout the mass; but, towards the bottom, or over the exit-flues, the ware would not be sufficiently burnt without reversing the order of firing. In order to meet this requirement there is a series of flues under the bottom, upon which the goods are placed, with small regulators at the end of each: these regulators, when drawn back, allow the fire to pass under the bottom, and to rise up among the goods which are not sufficiently fired, and thus the burning is completed. By means of these regulators the heat may be obtained exactly the same throughout: there is, therefore, a greater degree of certainty in firing, and a considerable saving of fuel, with the entire consumption of the smoke. From the fire or draft being under command, so as to be allowed either to ascend or descend through the ware during the time of burning or cooling, the waste caloric can be economised and directed through the adjoining kiln in order to partially burn it, or be used in drying off the raw wares on flues or in chambers. I have found the saving of fuel in these kilns over the common kiln, 50 per cent.; and to give an idea of the facility with which they can be worked, it is common for my men to fill the kiln, burn, cool, and discharge it in six days. But the time I usually allow is, to have each kiln set, burnt, and drawn in seven days.

To sum up the manufacture of bricks on the most improved system, the whole works should be under one roof, and only occupy a fraction of the space devoted to this manufacture in the field. The brick manufactory may be a square construction, a fourth of which, across the top, would be occupied by the steam-power mills and machines, with an allowance for working room: one-half would be used for drying the ware, and the remaining quarter for kiln-room. The clay should be brought into the works from the pit by trucks, on a light railway, of which some excellent ones for the purpose are manufactured by Mr. Crosskill, of Beverley, the celebrated agricultural implement maker. It should then be manufactured into bricks by machinery, and delivered to a drying-chamber, or laid on open flues (the latter being the cheapest in construction), in order to be dried, the flues or chambers being heated by the waste heat of the burning kilns. As soon as the bricks are dry, they should be stacked in the kiln, burnt, and delivered out, at the opposite end of the manufactory to that at which the raw clay entered, ready for use. This can be done in from eight to nine days from the time when the clay first entered the works; being a very little more time than is occupied in burning alone in many districts.*

To attempt to give the cost of manufacturing would only mislead. The largest item is labour, the cost of which varies so much between manufacturing and agricultural districts. The next is coal or fuel for burning, which ranges from 3s. to 20s. per ton, according to the district of country. Again, one clay requires a large expenditure of fuel to be used, in order to attain the most intense heat; while another will burn sufficiently hard at about 10 degrees Wedgwood. The consumption of coal for burning bricks varies with the clays, from 3 to 20 cwt. per 1,000.

BRIDGE FOUNDATIONS.

ROCHESTER.

In connection with the particulars already given of the mode adopted in constructing the foundations and piers of the new Westminster-bridge, some account of other systems of founding may be interesting. Let us first allude to the principle adopted from screw mooring, in Mitchell's screw piles, which have been used with success for a pier at Courtown, county Wexford; also for the staging for the breakwater at Portland; for the foundations of many railway bridges and viaducts; and for the Fleetwood, Maplin, and other lighthouses raised aloft on slender supports from the sand.

Pneumatic cylinder piles have been applied according to two different methods. The first invention was due to Dr. Potts, and was adopted in a bridge on the Chester and Holyhead Railway. The cylinders were exhausted by a double air-pump, the pile sinking as the exhaustion was continued. A cast-iron plate was fixed on the heads of the piles, on which the pier was built. The cylinders, as first used, were 12 inches in diameter; but subsequently a diameter of 5 feet, or even 7, feet was found advisable. This increase required increase of power to overcome the friction of the sides,—and that was effected by interposing another vessel, between the tube and the air-pump, which was first exhausted; when a communication being opened between the tube and the exhausted vessel, a double effect was produced,—namely, the excavating or exhausting process as in the former instance, with the addition of a sudden blow on the head of the piles.† The failure, however, in this process at Rochester, led to the adoption of the modification of the diving-bell principle, by Mr. John Hughes, which we referred to in our notice of the Rochester bridges,‡ where we alluded to an analogous in-

* The quality of bricks depends on the fineness of division of the particles, the proper admixture of the earths and their thorough amalgamation, the closeness or compactness into which they are worked, and, finally, the having been exposed to a sufficient heat to render them indestructible from exposure to any change of atmosphere

† Minutes of the Institution of Civil Engineers, April 29, 1851, "On Foundations, Natural and Artificial," by Mr. S. Clegg, jun. M. I. C. E.

‡ See *ante*, p. 418.

vention by Mr. Bush, for which he obtained letters-patent in 1841, and to one by Lord Dundonald, patented in 1830. An application of a similar principle appears to have been made in France, in the sinking of a pipe as a mine shaft: it is described in the "Comptes Rendus" of the Academy of Sciences, and in Dr. Ure's Dictionary of Arts, Manufactures, and Mines. The conditions to be answered by Mr. Hughes, were, that the cylinder pile should be kept free from water, until sunk 30 feet at least through the bottom of the river, in order that the men inside might excavate with ease; that the stone and earth should be promptly removeable; and that the pile should descend truly placed. When sunk, the cylinders were to be filled up with concrete and brickwork.

The cylinder lengths were in 9 feet, 7 feet in diameter, cast with flanges, at which they were screwed together and made air-tight. The top length had a wrought-iron cover bolted to it, through which two cast-iron chambers ⊍ shaped in plan side by side, in reversed positions, called "air locks," were fixed in the cover, partly above and partly below it. These formed the means of passing in and out of the cylinder, and were provided with valves or doors, and air-cocks to regulate the escape or the action of the compressed air of the pile. One valve or flap, at the top of the "air lock," leading to the external atmosphere, was closed when the other communication with the cylinder was open and the "lock" filled with compressed air; and the valve or door, lower down, opening into the cylinder, when the upper valve was closed, allowed the workmen to pass the materials out of the cylinder, or *vice versâ*. Each "air-lock" had two sets of cocks, one for forming a communication between the cylinders and the chamber, the other between the chamber and the atmosphere. One set of cocks was designed for the use of men passing in and out of the cylinder, and accessible from the inside: the other set was used in passing buckets or materials through the "air-locks." One cock between the chamber and the atmosphere was placed in charge of a man inside the cylinder, who, having closed the door, could let off the air and pass a bucket from inside to outside. Another cock, from the interior of the cylinder to the chamber, was worked by a man outside, who, on closing the flap, could fill the chamber with air, and pass a bucket from outside to inside. The principle is similar to that of canal locks.

The compressed air was supplied to the cylinder piles from a double-barrelled pump, worked by a steam-engine. The pile was weighted down to cause its descent, and was pitched with studied accuracy horizontally and vertically. The length of cylinder fitted with the air-locks had to be removed when a fresh length was added,—the water of course filling the pile each time,—from which, however, it could be again ejected by a few strokes of the pump.

At first, when the system was set in operation, the water was forced out at the foot of the pile; but this plan being found objectionable, a syphon pipe was added, descending inside to the bottom of the cylinder. Other minor contrivances were applied, which we need not describe. Some of the cylinders, as we stated, were carried down 40 feet.

Since the foregoing account was written, we have observed that Mr. Edward Cresy, in his recently published Supplement to his "Encyclopædia of Architecture," has given an account of the foundations of Rochester-bridge, with illustrations. This Supplement, we may say, appears to be a valuable work of reference as to many improvements dating subsequent to the publication of the first edition of the Encyclopædia. To it, however, we must give attention at a future opportunity.

In 1853, Mr. Hughes patented a modification of the method used at Rochester, which appears to deserve some attention at this juncture. The invention, which is for "improvements in building or forming structures under water or below the surface of the ground," contemplated the use of a hollow vessel, or "shoe," upon which the cylinder was to be raised, the structure being built around and externally to it,—the "shoe" descending and forming part of the foundation. Where required, the "shoe" can be floated on the water by aid of a deck, or floor, and the cylinder raised as before. Exhaustion, or compression of air to the cylinder, are applied as necessary; and many modifications and combinations of the invention will readily occur.

In the course of the inquiry, which we have endeavoured to open, into recent inventions for founding and building piers, we think it will have appeared that there is no reason to assume that coffer-dams—involving great expense, loss of time, serious obstruction to the water-way, and injury to river-banks—are inevitably required in the Thames bridges. We have noticed several old and new inventions, each possessing some merits, and each certainly not free from defects. Would it not be possible to make fresh combinations from such appliances, and to remedy the defects of one invention, by enlisting, further than has been done, the special advantages of another? If, for the timber-bearing piles of the new Westminster-bridge system, cylinder piles deeply founded and cased in concrete were substituted, the pier could hardly be inferior to the supposed strength of London-bridge, and might be free from some objections which we apprehend there are at Rochester.

THE LATE MR. THOMAS HOPPER, ARCHITECT.

MR. HOPPER was, we believe, in the seventy-ninth year of his age. Few men have passed a more active or energetic life than his, or have been more extensively engaged in important architectural works; and this will be considered more remarkable by some when it is mentioned that Mr. Hopper did not receive what is commonly called an architectural education. His father was a measuring surveyor, clever and prominent in his business, but of intemperate habits: his son's first years of active life were spent in assisting, or rather carrying on, his father's business; and these responsibilities dated from the early age of eighteen.

It chanced that, while engaged in this pursuit, he went to Craven Cottage, Wandsworth, then in course of erection by Walsh Porter, the "*arbiter elegantiarum*" of that day, and the guide of the Prince Regent in all matters of art and taste. Mr. Porter was struck with the ability of the young man, perceived his talents, and became his patron.

Hopper's first work was the enlargement and decoration of Craven Cottage, a good specimen of the *cottage ornée* style, which has since become fashionable; and from this period his career as an architect may be dated. He was introduced to the Prince Regent, and erected for him the conservatory and other works at Carlton House. His next noticeable work was Slane Castle, in Ireland, for the Marquis of Conyngham; and from that time his engagements in the erection or alteration of private mansions in all parts of the country became very numerous and incessant.

We have not a list of these commissions, but among them may be more especially named Peurhyn Castle, at Bangor, in North Wales, a work whereon vast sums were expended, and upon which his claims to the possession of high qualifications for his art would best rest; Margam, in South Wales, a noble mansion in the enriched Tudor style; Dunkeld, in Scotland, for the late Duke of Atholl, prematurely stopped, but laid out on a very comprehensive plan, and intended to be completed in a style of princely magnificence; Leigh Court, near Bristol, a classic house for the late Mr. Miles; Llanover Court, in Monmouthshire, for Sir Benjamin Hall; and Gosford Castle, in Armagh.

For alterations on an extensive scale we may mention Stansted Park, near Havant, Hants; Alton Towers; Stoneham Park, near Southampton; Rood Ashton, near Trowbridge; Easton, near Dunmow; Kimmel Park, near St. Asaph, for Lord Dinorbin; Amesbury Park, near Salisbury; and many others of less pretension. He erected several gaols on the system formerly adopted both in Essex and elsewhere, and more recently the extensive works required for the conversion of the Essex County Gaol at Springfield to the cellular system, involving an outlay of above 40,000*l*. He was also the architect of Arthur's Club House, in St. James's-street; the Atlas Fire Office, in Cheapside; and the Legal and General Life Office, in Fleet-street. For about forty years he held the office of County Surveyor of Essex, and that of Surveyor to the Atlas Fire Office.

He has died in a good old age; and though he cannot be pointed to as an example of what is now required in an architect, yet we may profitably emulate his great activity and constant perseverance. In his best days his flow of spirits was exuberant; his powers of conversation remarkable; his memory most tenacious. He never drank anything stronger than water, and could bear a marvellous amount of fatigue. Towards the close of his professional career, he designed St. Mary's Hospital, Paddington, and unwisely consented to superintend its erection gratuitously: such services are never very highly valued, and the engagement throughout occasioned Mr. H. considerable vexation. Of his most recent pupils, Mr. F. J. Francis (to whom we are indebted for information), and Mr. Burn, who has latterly had charge of Mr. Hopper's business, have made themselves best known.

He was a competitor for the General Post Office at St. Martin's-le-Grand, and he subsequently published his design, which he always maintained had been adopted in the existing structure There were on that occasion nearly 100 designs submitted by 89 persons, but on examination it was found that not one was adapted for the business of the office; and Sir R. Smirke, who had not been a competitor, was ultimately commissioned to erect the building.

Mr. Hopper also, at great expense, published in folio his plans for New Houses of Parliament.

On the whole, we cannot but feel that, by his death, a man of mark and power has been taken from amongst us.

HOUSE ADORNMENT.

To Girtin and Turner we are mainly indebted for the improvement in water-colour painting which has become now such an important agent in the decoration of English dwellings. The drawings by Girtin, most of those by Clennell, and the early water-colour pictures by Turner, are remarkable for a broad simplicity of grey colour, and have the appearance of having been washed in, to a considerable extent, with Indian ink, and the lights tinted on with warm colours upon the lights and shadows already modelled with the Indian ink. These early drawings form a striking contrast with the glow, strength, and purity of colour to be found in the later works of Turner, and the water-colour painters of the present day.

With proper management of the hanging and papering, nothing can be more elegant in a modern house than a well-selected collection of water-colour drawings. It does not answer, however, to mix them with prints, or with oil pictures, for one style of art, to a very great extent, destroys the effect of the other.

There is at present not so much of the decorative work of our dwellings left as in the olden time for the ladies to exert their ingenuity upon, but even that little might be somewhat better done. The patterns of the wrought covers of chairs and footstools are often of anything but good design. Instead of adopting some of the forms now so much in use, how much better it would be to adapt some of the scroll-work on our Gothic tombs and structures to this purpose. What, for instance, can be more elegant than some of the ivy, hawthorn, and other leaves on the tombs of the kings and queens in Westminster-Abbey. These forms, and many of the Gothic diapers, would, if properly used, and wrought in appropriate, rich colours, make a very great improvement in the needle-work decoration of the furniture of the present time.

The large old-fashioned screens which in former days were not only very ornamental, but also very useful and comfortable, often possessed much artistic merit. Some were of carved ivory, inlaid with light blue silk, silver, scarlet, black, &c.; some of embossed leather, others of tapestry work. The smaller kind of fire-screens might be made to afford an opportunity for artistic display.

In the great Exhibition of 1851, the collection of English and other carpets suggested several ideas for the improvement of this important manufacture at home. Those who carefully examined this portion of the Exhibition, while they were gratified at the skill shown by the English, were at the same time astonished at the richness and harmony produced in the carpets of Turkey and Persia. In the furnishing of a house, the choosing of the carpets is of more consequence than is generally supposed. In a room in which gorgeous pictures, by Titian, Rubens, and such artists are hung, and the fittings are of corresponding taste, the carpet will admit of a good deal of colour; but the carpet ought always to be a secondary consideration, and in no instance intrude upon the eye. It is, perhaps, a good sign of the proper balance of the interior decoration of a house, if in passing through it you are not led to observe what the carpets are.

GEOMETRICAL PRINCIPLES OF CONIC SECTIONS.

HYPERBOLA.*

THE hyperbola has lately acquired an importance in the eyes of students of Greek architecture by the publication of Mr. Penrose's work on the "Principles of Athenian Architecture," wherein he demonstrates that this is the curve which the Greeks adopted for the outline of their columns, and also of several of their mouldings. We therefore proceed to show how the knowledge of its properties will enable the architect to employ the hyperbola to form the entasis of his columns, instead of giving them the barrel-shape which we see in such columns as the Duke of York's monument.

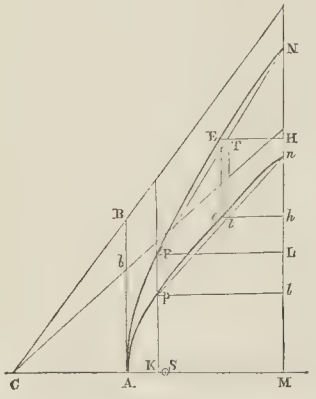

FIG. 1.

Let A P N, A p n (fig. 1), be two hyperbolas having a common centre C, and a common vertex A, but having asymptotes, C B, C b, inclined at different angles to the axis C A. Draw the vertical line A b B; then, if we draw any ordinate M n N, it is a property of the curves that M n : M N = A b : A B; so also K p : K P = A b : A B; therefore the horizontal lines P L, p l, are equal.

Mr. Penrose has made use of this property to show how a templet may be made at full size for the entasis of a column of the Parthenon, which method we now proceed to explain.

Let the semi-axis C A represent one foot, and take C S : C A in the ratio of, say 4 : 3, and make C b = C S, S being the focus of the given smaller hyperbola, by means of which the larger hyperbola is to be drawn. Take C B as the asymptote of the larger hyperbola, a part of which is to form the required entasis. We suppose that the column is to start from the pavement at P, and that P L represents the semi-diminution of the column; P and N will be found from p and n by means of the beforementioned property. Draw the chords p n, P N. Then, if we form a templet of the proper length of the column, and draw on it the line P N, and divide P N and p n into an equal number of parts, we can readily obtain as many points of the required curve as we please. For, let T on P N correspond to t on pn; draw the horizontals H T E, hte; then by the above property E T must equal et; and e being a point on smaller curve, E will be a point on larger curve; and so for any number of points.

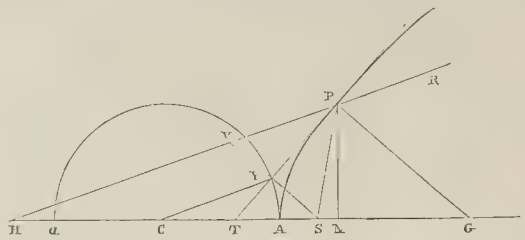

FIG. 2.

To draw a tangent at any point P (fig. 2) of an hyperbola, we proceed thus:—From the foci H and S draw H P and S P, on H P take P V = P S, join S V and bisect S V in Y, then P Y is tangent at P. If we draw a circle on the axis A a, for its diameter, and C its centre, the point Y will be found to be on this circle. For, join C Y, since S Y = V Y, and H C = S C, therefore C Y equals half H V (Euclid, book 6), equals half the axis A a, or C Y = C A (Since H V = A a, see last art.). Also, since V P = P S, and V Y = S Y; therefore, S Y is perpendicular to the tangent P Y. Therefore we have this property, *the perpendicular from the focus upon the tangent meets it in the circle drawn upon the major axis.*

It also follows that the tangent bisects the external angle H P S; therefore if we produce H P to R, and draw the normal P G or perpendicular on the tangent at P, then P G bisects the internal angle S P R, or, angle S P G = angle R P G. Hence it follows from the property of light that if a ray from S falls on a hyperbolic reflector, it will be reflected as if it had come from the further focus H. Compare this with a similar property in the Ellipse (page 141, *ante*).

To find where the tangent from any point T (fig. 2) on the axis meets the curve, *find C N a third proportional to C T and C A*, as in the case of the Ellipse (page 106, *ante*), draw the vertical N P to meet the curve at P, then T P is the required tangent. E. W. TARN, M.A.

* See p. 345, *ante*.

DESIGN AND SYMBOLISM.

THE view lately taken respecting non-progression in taste, cannot be considered satisfactory. It is supposed that we are at present in a torpid state, principally encumbered with symbolical decoration, which cannot be shaken off without difficulty. There are hints concerning this period, as if the present were the shade and the future were to be the sunny side of the beautiful, and that an equatorial line were to divide it into two hemispheres; but before the conclusion of every such essay, the reader becomes convinced that the rise and fall of styles are nothing more than transitional architecture.

In point of design, for many years great exertions have been made to get up a new style,—one that may be considered perfectly original, and still rank amongst the classic elegancies. Lately, nothing is heard thereof; and the consequence of its failure is, that draughtsmen are still confined to their books of proportions, and must reduce existing forms, with certain modifications, to the subjects on which they are engaged. They must consult libraries, and find, amongst the engravings of masterpieces, matter which, when collected and arranged, may be suitable for modern purposes. Thus, the spirit having departed from the stones of temples and amphitheatres, the designs may be ingeniously applied to palatial warehouses and other civil edifices, without causing any degree of suspicion; and it follows that books written on design and architecture, when they embrace what has been built, existing wholly or in ruins, remain works of reference, and are likely to continue so, until the expected change has arrived at some practical degree of operation.

The present state of art is nothing more than a reflex of the past, no matter how styles have changed, or when they were introduced. The rarest modern novelty will be found, on research, to have its origin in some great idea written, sculptured, or built, some centuries ago. Its revivification in another shape, or for another purpose, does not render the design less pleasing, no more than using the same materials in erecting different buildings. When art requires aid to carry out something unprecedented, she naturally looks back to what was or would have been done, under similar circumstances, by the early architects. In their works she points out to the designer the various phases of building, from mere reality to embellishment in pseudo-material, and from ordinary decoration to symbolism; and it depends on his own resources to adopt what will fully realize the purport of his imagination.

When we speak of a creative talent in conjunction with architecture, something more is meant than bricks, stone, iron, and glass; something superior to mere reality. This is to the architect what genius is to the poet: intuitively there is no distinction. The one uses ponderous materials, the other mental; and both kinds are taken up in a rough state from the world. They see mankind using this matter and this thought, in the ordinary way of living, whereas they give them a different meaning, shape, and order, so rendering them beautiful. The architect, in particular, may depart from beaten paths to cause admiration; still his works must be subservient to the usages of society. As improvement progressed, art required decoration, and genius gave her that adornment from one of the sublime works of creation,—foliage; but if nothing more than natural necessity animated mankind, we should still behold shapeless masses, or plain geometric piles, without reference to purport.

Decoration may be called by some an obstacle in the progress of legitimate architecture. Perhaps it has been when introduced with profusion; but it necessarily becomes the business of an artist to relieve his work with embellishment, tributary to the genius of his edifice; and if this be done with taste, he fulfils what talent requires on his part. At the present day an artist cannot enter into the general improvement without being figurative; and, in order to be original, he must combine natural and artificial existence.

Reality, indeed, must be the basis of design; but that reality would be dead walls or loopholes, unaided by symbolism. What now would be the state of the original Pointed style, were it not improved, extended, and exalted by those who saw nature with science? The different excrescences which shoot out from church and monastery, the construction of a mediæval building, the spire pointing upwards, are all simply architectural now, but not the less symbolical of certain great truths; that is to say, there was some centre for this style of architecture. Such sublime unity of expression could not have been produced, unless the architects inwardly felt what they outwardly showed in their works.

To the eye of an artist, there is not a more beautiful object than a figurative female bust; but the simplest subjects may be made the sport of poetical fancy. It is difficult to con-

vince men in general that such can be done, or that poetry may enter into the most rough and arduous occupation. In architecture, poetical licence becomes symbolism; and by it, can an artist, at any time, beautify a type or render it monstrous, in accordance with the bearing of his design. He cannot be at a loss for varieties or truthful position, when his conception of the ideal is in harmony with the purport of the building; and even then he may symbolize himself, or do as Hackett, the assistant architect of Batalha, who is seated on a lofty projection, looking down on the lofty works he superintended.

When the outward forms of buildings became typical, it is not surprising that everything internal followed in due course. The desks, tables, altars, fonts, and all other ecclesiastical and civil appendages were moulded and fashioned similarly. The Pointed style of church architecture could not long have remained in its rude state, when so many illustrious personages contributed to render it perfect. Almost all individuals, in those times, appeared zealous to make church edifices eminent; some, perhaps, induced by private motives, but the many with exquisite feelings of spirituality. It is but a natural conclusion, that symbolism should be the result of this sincere devotion—the service of religion unalloyed with worldliness, as much as it could be practicable. And we are well aware, that where matter-of-fact sculpture and figures would offend the eye, and turn divine worship into ridicule, the same may be raised for contemplation before the mind, beautifully in figurative outlines.

Temple and church building was the sphere in which architecture first arose, long, naked, and detached stones, and ultimately arrived at perfection; and from it proceeded all other varieties of construction. In the transition, no doubt, it was accompanied with those symbolical ornaments, long before fixed as classical, and considered inseparable from the composition. The mediæval structures communicated their influence to military and civil affairs, and castles, mansions, and farmhouses were built and decorated in accordance with the spirit of the age. If, independent of their originality, time rendered these buildings venerable, and even coerced the mind to admiration, that is no reason why they should be copied servilely, at the present day, when the same field is open to the studious and persevering, and decoration may be greatly diversified, in harmony with the purpose for which an edifice is intended. But, to carry this argument to an extreme, let those who desire to cast off the figurative, imagine such a building as Salisbury Cathedral stripped of all its ornamentation, tracery, spire, and everything but what is absolutely necessary, after the plainest manner, for public worship: let them imagine this, and even the cruciform plan changed to quadrangular; and their feelings will soon convince them that there is something more than decoration and show in the mediæval church. They may not deny that religion, in those days, suitably arranged herself in external forms. They may probably acknowledge that design and imagery are identical, and that symbolism is the soul of architecture.

FRANCIS SULLIVAN.

THE CAMBRIAN ARCHÆOLOGICAL ASSOCIATION.

THE annual meeting of this association took place on 18th ult. at Welchpool. The days of meeting were Monday, Tuesday, Wednesday, Thursday, and Friday, in the week beginning with the 17th ult.

On Monday the business of the association commenced by the members holding their preliminary meeting in the evening. The public meeting was held at half-past eight. The attendance included the Earl of Powis, Archdeacons Clive and Williams, and various other clergymen and other gentlemen, with several ladies. Lord Powis presided. Lord Dynvor, the late president, was absent owing to illness in his family. After an address was delivered by Lord Powis to the meeting, the annual report was read, and unanimously approved of. The Rev. H. L. Jones then gave a sketch of the notabilia of Montgomeryshire, including Offa's Dyke, for the preservation of a portion of which archæologists were indebted to their president, Lord Powis.

On Tuesday the members of the association had arranged to make an excursion to Breidden, Buttington Church, Crew-green, and Llandrinio Church, returning through Guilsfield. The weather, however, was unfavourable, and the members therefore disposed of themselves as best they could until the evening meeting, when the attendance was much more numerous than on the preceding evening. The Rev. E. L. Barnwell then read an able and interesting paper on "The Ancient Stones of Brittany," especially those of Loc-Maria-Ker, near Carnac, which had been somewhat overshadowed by their more celebrated companions at Carnac. After some discussion on the subject of this paper, Archdeacon Williams read a learned paper on "Ancient Celtic Coins." The Museum proved to be a chief point of attraction to the archæologists on Tuesday. The objects were arranged in the Grand Jury Room, at the Town-hall, and embraced not only a great number of local interest, but others, the associations of which were not confined to the Principality.

On Wednesday, the members of the Association visited the antiquities of the town of Welchpool, including the church, with its chancel of fourteenth century, &c. They were afterwards received at Powis Castle by the president. Here they inspected the bibliographical treasures of the earl's library, the numerous historical portraits of the gallery, the architectural details of the castle, the terraces and hanging gardens, &c. A cold collation was served in the long ball-room. At the evening meeting, which was fully attended, Mr. J. H. Parker, F.S.A. Oxford, gave an account of the chief architectural features of Powis Castle, and explained the absence of any visible remains older than the period of Henry VIII. by observing that the edifice had always been inhabited, and modified in every century to suit the wants of its noble occupants. The Earl of Powis added some remarks in explanation of Mr. J. H. Parker's description. Mr. T. O. Morgan then read a paper on the Marches of Wales, and on the division of Wales into counties, *temp.* Henry VIII. This gave rise to an animated discussion, in course of which the president spoke at much length about the Salopian Marches, giving the members some valuable information. The Rev. D. Davies followed with a paper on the Roman remains of the station of Caer Sws, between Newtown and Llanidloes, tending to show that this was the actual site of Mediolanum, which had been much disputed.

On Thursday, an excursion was made to the Roman camp of Clawdd Coch, in the meadows, near the junction of the Vyrnwy and Tanat, and thence to Llanyblodwell, where the party were entertained by the vicar, the Rev. John Parker, and inspected his collection of antiquarian drawings, &c. They then visited the church of Llansantffraid and that of Meifod. At the evening meeting, which was attended only by subscribing members, the annual votes of money, the appointments of officers, and the recommendations of the general committee were considered and passed. A considerable number of new members were admitted, and the treasurer's accounts showed a balance in favour of the Association of more than 25 per cent. on the annual income, after all expenses had been paid. Archdeacon Williams then continued the reading of his paper on ancient Celtic coins, and a discussion followed.

On Friday, an excursion was made to Offa's Dyke and Montgomery. The members were conducted by the Earl of Powis over the castle (*temp.* Henry III.), few walls of which remain, though the lines of works are all distinct. The president then took them to the summit of the Fridd Faldwin, a large British camp on the hill westward of the castle. After hearing a lecture in the church, on its architecture, by Mr. R. K. Penson, the members followed the Earl of Powis to his ancient house in Lymore-park, close to the town, a large black and white woodwork edifice of the Elizabethan era. Here his lordship again entertained them with a sumptuous cold collation; and then took them to see Offa's Dyke, in the park, as being the place where it would be found most perfect. On arriving at the spot, as the *Times* report remarks, his lordship's astonishment and chagrin may be conceived at finding a gang of labourers busily engaged in destroying it, by the order of his own farm-bailiff! The association then proceeded to an Early British castle near the town, and so to the Gaer, a large Roman camp near the Severn, on their return to Welchpool. At the evening meeting, which was the concluding one, and where every seat was occupied, the Rev. Rowland Williams read a paper on the position assumed by the early Welsh Church towards the Saxons. The Rev. H. H. Knight then gave an account of the owners of Powis Castle from the earliest period to recent times; and Mr. Longueville Jones followed with a paper on the towns built in Wales by Edward I. compared with those erected in Aquitaine and Guienne by the same monarch—a subject already treated by him in the *Annales Archéologiques*. The usual votes of thanks were then given and acknowledged, and the meeting finally broke up.

Although the weather was unpropitious during the greater portion of the week, the proceedings of the association did not seem to flag, and the value of the papers has tended to make the Welchpool meeting one of considerable archæological interest.

LONDON ANTIQUITIES IN BRITISH MUSEUM.

THOSE who look in to that comparatively desert space in the British Museum, called the British and Mediæval department, will find that one of the empty cases has been filled with a part of the valuable collection of antiquities which have been chiefly gathered from the Thames and London, after years of patient care, by Mr. C. Roach Smith.

The matters at present exposed to public view are but a tithe of the ancient remains of Old London, which have, by the efforts of the press, and the exertions of a number of individuals, become national property: it is, however, pleasant to look over them.

There are flint arrow-heads, spear-heads, knives and weapons of stone, found in the bed of Father Thames, at Whitefriars, Parliament-street, the Port of London, &c.

Bronze weapons of Roman date, from Thames Ditton, Whitehall, and other familiar places. Some of the swords are in good preservation; and even after the lapse of so many centuries, the scabbards are in part left.

There are Roman fibulæ, some beautifully inlaid rings, &c.; some of these from Botolph-lane, dug up in 1846. There are also lockets, amulets, beads, and other articles of female decoration; Roman keys, from the corner of Moorgate; lamps, little hand-bells, spoons, &c. from the London Docks.

The specimens of glass of various colours are well worthy of notice: the deep rich tints, of blue and purple, are particularly rich. The castings of heads, of fine design, in delicately coloured glass, have quite a gem-like appearance: some of these beautiful objects are from Clement's-lane, and other parts of the City. There are some fragments of old armour from East Smithfield; bronze Celts, and other similar matters, found off the Temple in 1831; Roman and Saxon swords, found off the Temple; small altars; combs, of different width of teeth; Saxon crosses, and other objects of the greatest use, in illustrating the history and manners of ancient London.

Passing from the cabinet which contains the fragments slightly referred to above, and glancing at a few of the most interesting objects contained in this scantily filled department, it is to be regretted that so many objects, some of them of great value, are left without any written description: the consequence is, that persons of even good general information are puzzled to make out what they are, and fail to derive that amount of benefit from the sight of these objects which would otherwise result. To the great masses who visit the Museum, this want of lettered description has still a worse effect, for they pass by things of rare interest without giving them a glance. There are here some articles of art manufacture of very chaste design, and of fine workmanship; amongst them

a blood-stone cup mounted in gold, a flask of lapis lazuli of the sixteenth century, and some cups of rock crystal, richly carved, from the Soane collection: there is an engraved crystal with the following inscription:—"Engraved Crystal, representing the history of Susanna and the Elders: it was made by order of Lothian, king of France, A.D. 954—986, and formerly belonged to the Abbey of Vasor, on the Meuse." In this instance the relic is well described, and it would be a great benefit if the busts of Roman emperors, and the thousand other objects of value and interest contained in the British Museum, were described in a popular manner, and at some length: the place would then be like an instructive and useful book to all who chose to walk through it.

LODGINGS IN LONDON.

WE have had submitted to us a case of such frequent occurrence, and which presses so hardly on a large part of a most valuable and industrious class of the community, that although it may appear somewhat like a repetition of former arguments used on the subject of dwellings for the working classes of the metropolis and other large towns, we give the particulars as they have come to hand.

"You know how inadequate and inconvenient the arrangement of the houses is in London, which are available for the use of persons who are provided with, say half-a-dozen children, and a limited income: there are several thousands in this great place who are either so circumstanced that they cannot get possession, or who would not wish to incur the risk of taking a house saddled with rates and taxes, which are constantly becoming due. Many an honest, hard-working man has brought himself to ruin and beggary by speculating in the taking of a house larger than he requires for his own use, in the hope of letting off the extraneous part to cover the extra expense. The spare places have perhaps been for a long time without occupation, and the trouble with bad-paying tenants leads often to the incurrence of debts, which are a drag during life, and have often been the means of causing executions, which have left families without either furniture or a permanent cover for their heads.

There are also others who are equally sufferers by the present arrangement of the great mass of the dwellings provided for the poorer classes: I mean those who, in order to manage their income and expenditure without risk, engage part of a house, and put up with the troubles of that rather than get into arrears: in this, however, there is but little safety in too many instances. In my own case at present, I have had part of a house for some time, and regularly each week paid my rent: another person has, I believe, done the same. The party, however, who rents the house from the landlord, has not paid rent, as I learn, for half a year, and the arrears of taxes were left to amount to 5*l*. I got information of this, and by paying some charges over and above my rent, I was glad to move away almost like a thief in the dusk, in order to save the articles which are so necessary to my family. On discovering that I was acquainted with the circumstance, the person who rented the house soon moved off, and left the landlord not only minus his rent, but also to pay the amount of taxes above mentioned, and probably, in addition, to make some arrangement in order to get possession of the place.

It is only those who have experienced the difficulty, that can form an idea of the trouble there is of getting quarters when the number of children is large, and the sum of money which can be spared for rent is not more than six shillings or so per week; and yet it is the children of those with limited means who require, more than others, comfort and arrangement in their dwellings. I submit to you, sir, that the houses which are at the service of the great bulk of the married workmen in London are a trouble both to landlords and tenants. Instead of the houses being arranged in the manner they now are, is it not possible to provide sets of rooms which might be let at from 5s. or 6s. to 7s. a week, in which the bedding and other household matters of the tenement would be safe, and where the occupier would have the comfortable feeling that when his rent was paid he would not need to fear the visits of the bailiff from the landlord, or a messenger from her Majesty for overdue taxes.

I could tell you various instances where decent people with families of children have had all their possessions taken away under the circumstances I have above attempted to describe, although they have had the weekly receipt for rent in their hands; and I am sure that he who will show that houses fit for the means of the working man can be made at a fair profit to the speculator, would confer a benefit on the community which it is difficult sufficiently to estimate."

CHURCH-BUILDING NEWS.

Warlingham.—The small and interesting church of Warlingham is about to be restored and enlarged, by the addition of a north aisle and vestry, together with new benches, roof, &c. under the direction of Mr. Withers, of London.

Greenhithe.—On Thursday in last week the Bishop of Rochester consecrated the new church of St. Mary the Virgin, Greenhithe. All the seats in the church, which will accommodate about 500 persons, are open, and there are no galleries. The floor of the nave and chancel is paved with tiles which are coloured black, red, and buff, and laid in patterns. The cost of the edifice is about 3,000*l*.; of which 500*l*. have yet to be raised.

Salisbury.—The Chapter-house of Salisbury Cathedral has been recently restored, but to complete it eight stained glass windows are requisite. Some ladies have agreed to raise the necessary fund—215*l*.—for putting in one of the windows, and Mr. G. W. Digby has agreed to defray the cost of another. Her Majesty has transmitted a donation of 100*l*. towards the restoration of the Chapter-house.

Llandudno.—On 15th ult. the foundation-stone of an Independent chapel was laid in this rapidly-increasing town. The building is to be erected in the Decorated style of architecture, on a site in Tudno-street. The plan consists of a parallelogram 70 feet long by 33 feet 6 inches broad. A large doorway is provided in the front, which enters into a vestibule divided by an ornamental screen from the chapel. Entrance is obtained into two aisles, each 3 feet wide. These aisles run the whole length of the chapel, with ranges of pewing on each side. The total accommodation is for 500 persons. At the end of the chapel is the pulpit, placed in the centre, with a table in front for the celebration of the communion. Behind this is an arch, transmitting light from a triangular tracery window at the back of the recess, which is 6 feet wide and 21 feet long; and a second ornamental screen, with doors leading to a staircase, and conducting to a basement floor, in which is a school, with six windows on each side, and adapted for lectures and public meetings. Public and private vestries are also attached. The length of the chapel is divided into six by buttresses, between which are one-light windows to light the chapel, and two-light windows for the schools under. The whole is covered with a high-pitched roof. The gable of the principal front is filled up by two single-light windows, filled with tracery, with a circular window above the whole. The building is to be erected with stone from the neighbourhood, with Stourton Hill stone dressings. The architect is Mr. Joseph James, of London, and the contractor is Mr. Yates, of Liverpool.

Wolverhampton.—St. John's Church, Wolverhampton, which was rapidly falling into decay, has been under reparation and alteration, and being nearly completed, the edifice was to be re-opened on Sunday last. The architects to whom the direction of the works has been entrusted are Messrs. Bidlake and Lovatt; and the contractors are Messrs. Higham and Mr. Tottey. The windows have been taken out and new leaded: new steps have been placed at the north, south, and west end doorways; the spire pointed; the churchyard-wall repaired, and a lightning-conductor fixed. In the interior, the ceilings have been coloured and the walls painted, the oak-work varnished, the capitals of the pillars, the chancel, the altar-piece, and the windows decorated, and the mouldings in the chancel gilded.

Sutton Coldfield.—The foundation-stone of the church of St. Michael the Archangel, at Boldmere, near Oscott, will be laid on 10th inst. by the Countess of Dartmouth. The church will be erected by Mr. Highway, of Walsall, from the designs of Mr. J. F. Wadmore, of London. The Decorated is the period chosen for the style; and ultimately the edifice will consist of nave, chancel, aisles, tower, and spire; but at present only the nave, chancel, and tower are to be erected, the aisles and spire being omitted, the former until the accommodation is required, and the latter from want of funds. The material to be employed is Rushall stone, and for the roof and other interior fittings stained fir. The seats will all be open, and the major portion free. The architect gives a stone pulpit and an oak lectern. It is intended to erect a parsonage-house near the church, and both edifices are expected to be finished by the 29th of September next, in order to allow the church to be consecrated on St. Michael's-day. Schools for boys and infants are already provided and maintained by the corporation of Sutton Coldfield. The site for the church is given by the Rev. W. K. R. Bedford, rector of Sutton, who also furnishes an endowment amounting to about 160*l*. per annum. The funds for the erection of the building are deficient by about 800*l*.

Heanor.—Messrs. C. and A. Gibbs, of London, have executed a stained-glass window, containing subjects from the life of our Lord, for Heanor Church, near Belper, Derby. The window is a monument to the late Mr. Joseph Barrow and his family. It has been erected by the Rev. Joseph Wolley and family, relatives of the deceased.

Boston.—The opening of a new Unitarian chapel at Bolton took place on Thursday in last week. The building is Gothic, of the Early English period, and of stone. The plan is cruciform, and consists of a nave and two transepts, the nave being continued 11 feet beyond the sides of the transepts. The length of the nave externally is 71 feet 9 inches, and the width 11 feet. The transepts are each 21½ by 15½ feet—the width across the nave being 72 feet. The principal entrance is at the east end of the building. The total height from floor to ceiling is 39¾ feet. A gallery is carried round the chapel, supported by light iron pillars, and open framing. The west end is appropriated to the choir and organ, under which are vestry, committee-rooms, library, &c. A large school is under the chapel. The whole building is to be heated by hot-water pipes.

Doncaster.—The great east window of the parish church at Doncaster, the only one which was wanting to complete the four great windows, is finished. All the windows of the church are now completed. The east is the largest of the four. It has undergone considerable alteration in design, according to the local *Gazette*, since the drawings were first exhibited in 1853. The present pattern is that given in the second edition of Mr. Denison's lectures. The roof of the nave is boarded over and covered with felt. The aisle roofs are in progress, and it is expected that all except the tower space will be roofed over before the end of the year. It must then be determined whether the tower is to stop there, and be covered with a temporary roof until money can be raised to build it up, or is to be carried on at once under the provisions of the present contract. In the former case the tower will probably cost 2,000*l*. more to build, whenever the work is to be resumed, than if it is carried on under the present contract.

Leeds.—The foundation-stones of the two chapels in the Municipal Cemetery for Holbeck were laid on Thursday in last week. The cemetery comprises nine acres of land at Beeston-hill. The soil is a dry shale. The land purchased (in all 11 acres) cost 2,100*l*. The cemetery has been laid out by Mr. Filliter, the borough surveyor. On two sides it is to be enclosed by a stone wall, and on the other sides by a wall and iron palisading. The cemetery itself will be divided into two portions—one-half to be consecrated, and the other half unconsecrated. Upon either portion a chapel will

be erected, and there are also to be two lodges —one for each portion of the cemetery. The chapels (which are to be erected after designs by the borough surveyor) will be in the Early English style of architecture: each will be 25 feet long and 18 feet wide, with an octagonal apse. The total cost of the cemetery, including purchase of land, building of walls, and erection of chapels and lodges, will be about 7,000*l.* to be raised by rates levied upon the township of Hunslet under the authority of the Leeds Improvement Act. The contractor for the erection of the chapels is Mr. Whiteley, of Woodhouse, builder. Their erection is to be completed on or before the 1st of December next.

Redcar.—The window erected in the church of this sea-bathing place to the memory of a late incumbent is thus described by a correspondent of the *Leeds Intelligencer*:—The window consists of four lights, cinquefoiled, with foliated eyelets filling up the head. The centre eyelet contains the pelican feeding its young with its own blood. The window may be said to be formed of two fenestellæ, each one consisting of two lights, and bearing in the head a quatrefoil. Each of these quatrefoils contains the sacred monogram I. H. S. Commencing on the north side, or the left hand, the first-light has in the head the I. H. S. beneath the Evangelistic symbol of St. Matthew—namely, an angel bearing a scroll; and beneath this an effigy of that Evangelist under a highly enriched canopy. The Evangelist is clad in a rich green robe lined with amber, and under that a dress of blue. He carries in his hand a book, in which he is represented as writing. The second light contains the symbol of St. Mark—namely, the ox; and beneath it, under a canopy of the same outline as the former, though of varied colours, the effigy of that Evangelist. He is represented in an outer garment of pale maroon, lined with green, and an under coat of red. He holds a book, in which he is reading. The third contains in the upper part the symbol of St. Luke, a lion, and beneath it, within a niche similar in all respects to the former one, a representation of that Evangelist. He appears in a vestment of red lined with blue, covering one of a rather pinky hue. He holds in one hand a book, and in the other a pen, as does also St. John. On the extreme right there is the same I. H. S. with a symbol of St. John, namely, the eagle. The niche is similar to the one on the extreme left, and bears the figure of St. John, robed with a garment of amber lined with green, and, underneath, one of blue. Beneath these are four medallions, which, taken in the order already observed, bear representations of St. John the Baptist, our Lord, St. Peter, and St. Paul, each with some characteristic mark,—namely, St. John with his dress of camel's-hair and the vefillem; our Lord in the act of saying, "Come unto me all ye that are heavy laden, and I will give you rest;" St. Peter with the keys; and St. Paul with a sword. Our Lord is distinguished by the ray of glory in the form of the cross. At the foot of the window runs the inscription in old text. The flood of light which pours into the church from the south to a very considerable extent damages the effect. Mr. F. Barnett, of Edinburgh, was the artist who produced the window.

Knaresborough. — Trinity Church, Knaresborough, consecrated on 18th ult. is of Early Pointed character, and stands at the south-eastern extremity of the town. It has been erected at the cost of about 3,000*l.* obtained by subscriptions, together with grants from societies. It consists of nave, with clerestory, chancel, north and south aisles, north porch, organ chapel, and vestry. The tower is engaged at the western extremity of the north aisle, with two arches opening into the church. The seats in the nave, accommodating 400 adults, are entirely free. The church in all, as before noted, accommodates 800 persons. The architect was Mr. Jos. Fawcett, of the firm of Mitchell and Fawcett, Sheffield.

Ugthorpe.—A new church has been opened at Ugthorpe, near Whitby. The building is of the fourteenth century, cruciform, with a bell-turret and spire at the west-end. The font is the gift of Archdeacon Churton, and is of Caen stone, the basin octagonal. The site was given by Mr. James Hindson, of Ugthorpe. The church is built entirely of stone, from Stonegate, presented by Mr. Wm. Hill.

Jarrow.—Arrangements are being made for the erection of a new United Presbyterian Church at Jarrow. It will be built of brick, and capable of containing nearly 400 persons. There will also be a school-house attached.

Wigan.—The new cemetery for the town of Wigan is now nearly complete, and was lately consecrated. It is situated about a mile and a quarter from the market-place, in the township of Ince-in-Mackerfield, and consists of eighteen acres of land, enclosed with a stone wall, 6 feet high, except a small portion at the eastern end, which forms the entrance, where there is a semi-circular dwarf wall and iron railing, together 6 feet high. A road 12 yards high has been formed from the highway to the entrance of the cemetery, the railway cutting being crossed by an iron girder bridge, of three spans or arches. On either side of the entrance-gates a lodge has been erected, in the Early Domestic style. From the entrance-gates to the west end of the cemetery, a carriage-way has been constructed, and eight acres of ground on the south side are appropriated for the use of the Church of England. On this ground the episcopal chapel is erected. On the north side of the road lie ten acres, appropriated, six acres to the Roman Catholics, and four acres to the Dissenters—the only separation between the two being a winding road. The episcopal chapel consists of a nave, 33 feet by 22 feet; chancel, 16 feet square; and a vestry at the south-east angle, 9 feet by 8 feet 9 inches. The porch is of ornamental timber, and adjoining it rises an octagonal turret, surmounted by a stone spire, the total height of which is 59 feet. The windows on the north and south side of the nave are trefoliated lancets, with mullions and drop arches internally. The chancel window on the east is of three lights, filled with light geometric tracery. The chapels on the Roman Catholic and Dissenters' portions of the ground are precisely similar in plan and general arrangement. The cemetery was opened on the 1st of September.

Forgue.—The *Banffshire Journal* states that the foundation-stone of St. Margaret's Episcopal church, Forgue, was laid on the 21st ult. by Mrs. Morison, of Bognie. The church is already in course of erection on a site given by Mr. Morison, with space for a burying-ground around it, besides a site for a parsonage with a garden attached. Mr. and Mrs. Morison also contributed largely towards the building fund. The church has been designed by Mr. William Ramage, of Aberdeen, architect, and lithographed by Keith and Gibb, of Aberdeen. The style is Early English, sharply pointed. The church consists of nave and chancel distinct; the former 56 feet by 24 feet, the latter 28 feet by 18 feet, entered from the nave by an arch of Auchindoir freestone, of which material the whole of the dressed work is to be constructed. There are buttresses of it all round, double at the corners, and one between each window. The windows are single and double lancets alternately on the north and south walls, with two single lancets and a trefoil in the west gable, and a window of three lights at the east end. On the south side is a porch, and the sacristy, under which is the heating chamber. On the north side, at the junction of nave and chancel, is the tower, of three stories, square, surmounted by a solid hexagonal spire with vane, measuring in all, in perpendicular height, 100 feet. On the base of the tower is the organ-chamber, which opens into the choir by a stone arch. The chancel is to be paved with encaustic tiles, and fitted up with stalls for the choir. The roof is equilateral. The mason is Mr. John Thompson, of Forgue. The carpenter work is to be executed by Messrs. W. and J. Cooper, of Huntly. There are no funds at present to finish the spire or to fill the windows with stained glass.

FRENCH MODEL LODGING-HOUSES.—There is some idea of undertaking a vast enterprise, which is said, according to the *Siècle*, to have received the approbation of the Government. It is, to erect, just within part of the fortifications, 2,500 houses, in groups of fifty, which would thus give fifty villages, each forming a sort of square. Each house is to accommodate six workmen's families, at a rent to each of not more than 150 francs.

PROVINCIAL NEWS.

Peterborough.—The Great Northern Railway Company, it appears, are about to build another row of fifty houses at "New England," for the accommodation of their servants, which, when complete, will make 150 houses. At the last half-yearly meeting, the shareholders agreed to a vote of 700*l.* for building a school for the instruction of the children of the occupants.

Yarmouth.—There is, it is said, every prospect of the projected new pier, at the end of the Regent-road, being carried out. The proposed structure will be of timber, and will commence at low water mark, whence it will run out into the sea some 500 feet, or nearly double the extent of the Wellington Pier. It will be 25 feet wide, being 5 feet narrower than that pier, and will terminate in a round end instead of a T end. It is also proposed to erect refreshment and waiting rooms, with every convenience, at the land end. A concrete road will lead across the beach from it to the Regent-road. The total estimated cost is about 4,000*l.* of which more than half is already privately subscribed or taken up. The new Britannia-terrace will be completed for the entire range; and a little to the north it is intended to erect a first-class hotel, with *tables-d'hôte* upon the continental principle, and bath-house, &c.

Cambridge. — At a recent meeting of the Visitors of the Cambridge Pauper Lunatic Asylum, a long discussion took place upon the report of the architect that glazed bricks for lining the corridors, day-rooms, and other internal portions of the building could not be obtained, unless at an enormous expense, and recommending the substitution of plain bricks for some portions of the work, and Parian cement for other portions. Mr. Hill's "characteristics" of his plan, according to the local *Chronicle*, were referred to, one of which was to the effect that all corridors and day-rooms, store-rooms, workshops, chapel, kitchen, laundry, brewhouse, &c. &c. being lined with glazed bricks, would save both painting and lime-washing, and subsequently avoid a large yearly expenditure for repairs. These glazed bricks were provided for in the contract, and the Visitors considered that such a very important item ought to be forthcoming, and expressed their sentiments very strongly upon the subject, both to architect and builder. Mr. Jones (the architect) and Mr. Webster (the builder) explained that glazed bricks could only be obtained at a cost of 12*l.* per thousand, delivered at Cambridge; and Mr. Jones stated that in making his calculation he took it for granted that any brick clay would readily take glaze, and that the expense would not be increased by more than 2s. 6d. or 3s. per thousand. At length it was determined to adopt so much of the report of Mr. Jones as recommended the omission of glazed bricks, and the substitution of plain bricks, a corresponding amount being deducted from the contract sum, and the architect and builder undertaking to finish the chapel in stucco if required, without its being considered an extra. Arrangements are about to be made for laying the foundation-stone.

Worcester.—The Streets' Committee of the Worcester City Council have resolved to accept the tenders of Mr. Richard Barrow, of Chesterfield, for contract No. 1 (iron pipes for the waterworks); of Mr. John Aird, of Southwark, for contract No. 2 (pipe-laying for the waterworks); of the Haigh Foundry Company, near Wigan, for contract No. 3 (engines, pumps, and machinery for the waterworks), for the sum of 2,500*l.*; and of Messrs. Wilkinson and Beard, of Newcastle-under-Lyne, for contract No. 4 (the sewage works), for the sum of 14,684*l.* 10s. 8d. Mr. Hawksley had stated that the result of the competition indicated that the cost of the works would be within the amount of his preliminary estimate. It was resolved to recommend the Council to advertise for a sum of 10,000*l.* to be advanced immediately, and another sum of 10,000*l.* to be advanced in January next, on mortgage of the special district rates, the principal and interest to be paid off by thirty equal instalments. The purchase of the site of the engine-house, filtering-beds, &c. being in a forward state, the Council was recommended to

advertise at once for tenders to execute the works.

Gloucester.—Public baths are about to be provided for Gloucester. Plans have been prepared, and it is intended to construct the building on the most approved principles. There will be first and second-class baths for ladies and gentlemen, and a swimming-bath, about 70 feet long and 30 feet wide, with a fountain in the centre. The front of the building has been designed by Messrs. Jacques, of Gloucester.

Swansea.—The Ferry-side National Schools were opened on Tuesday in last week, and are now nearly completed. The buildings are erected on a site given by the Earl of Cawdor, near the railway station. They are in the Mediæval Domestic style of architecture, built of limestone, with Bath stone dressings, and consist of a girls' and infants' school-room, boys' school and class-rooms, with separate entrances and lobbies, a residence for the schoolmaster and schoolmistress, and lodgings for the curate of the parish. The girls' and infants' school is in the clear 30 feet long by 18 feet wide, and the boys' school 33 feet by 20 feet, and they are so arranged as to be capable of forming one large room by means of folding-doors. The roofs of both school-rooms are open to the ridge, and are constructed with principals of an arched shape. The ceiling is formed between the common rafters or spars, and the whole of the timbers being thus exposed to view are wrought, stained, and varnished. The buildings are covered with stone tiles and ornamented ridges. At the junction of the roofs over the schools there is a bell-turret of stained timber, with pointed roof, rising to a height of 18 feet from the ridge of the roofs. The buildings have been erected by Mr. Jenkins, of Ferry-side, from the designs and under the superintendance of Mr. R. K. Penson, of Swansea, architect. The building-stones, roof-tiles, and a portion of the haulage were given by the parishioners.

Birmingham.—The town council of Birmingham have unanimously resolved to purchase Aston Park and Hall, the seat of the late Mr. J. Wall, as a place of public recreation, if the price demanded be reasonable. Lord Calthorpe has also, in imitation of a similar act of generosity by Mr. Adderley, M.P. placed the land he proposes to set aside as a public park at the disposal of the council, without restriction of any kind, relying on the good sense of the people of Birmingham for its proper use and conservation. Birmingham will thus be shortly supplied with public grounds and promenades, where its industrious artisans may breathe the fresh air within the shortest possible distance from their workshops and manufactories. The Adderley Park has already been opened.

Salford.—The newly-formed company for the erection of public baths and laundries, in Manchester and Salford, opened the first of their intended establishments on Wednesday in last week, in Collier-street, Greengate, Salford. The building is of brick, with stone dressings, in the Italian style. It contains a large number of first and second class private baths for men and for women, besides two large tepid swimming-baths (first and second-class); and in the laundry department there are thirty-eight washing places. Each class of baths has its own waiting-room, suitably furnished, and a separate entrance and staircase.

Bradford.—The town council of Bradford, after resolving to unite the offices of borough surveyor and manager of the waterworks, have appointed Mr. Charles Gott their temporary surveyor to both offices, at a salary of 200*l.* a year. They also, at same meeting, resolved to advertise for an assistant surveyor or clerk, at 120*l.* a year.

Dundee.—At a recent meeting of the Committee of Corn Exchange and Public Hall subscribers, the tenders for erection of the Corn Exchange and Public Hall, on the site in Bank-street, were finally accepted, and the buildings will be immediately proceeded with by the contractors. The hall will be capable of accommodating from 1,800 to 2,000 persons sitting, or about 5,000 persons standing; and will be so arranged by the proprietors, as to be available for concerts, assemblies, public meetings, and other similar purposes.

THE MINISTERIAL *NON*-RECIPROCITY SYSTEM.

I have no more interest in the architectural profession than with the profits of any other class of her Majesty's subjects; but *until her Majesty's Ministers are selected by competition from the best qualified of all other nations*, I must protest against foreign competition in designs or erection of national buildings; and I trust the British architects will act upon their rights as British subjects. I need scarcely add that the existing non-reciprocity system connected with our commercial economy should be promptly corrected, or John Bull will not have an ounce of gold or silver left in his money-chest.

Observer.

The accidental discrepancy between the number of premiums stated (eighteen) in the conditions we printed last week, and the actual list of premiums recited (fifteen) was not a mistake of ours. We printed the terms exactly as they were stated to the meeting. The list (of fifteen) is correct.

COFFEE AS A DEODORISER.

Now that the "sporting season" has again come in, we beg to remind sportsmen and others that fresh-ground coffee is a perfect and safe deodoriser: a sprinkling will keep game fresh and sweet for several days. Clean your game,—that is, wipe off the blood,—cover the wounded parts with absorbent paper, wrap up the heads, and then sprinkle ground-coffee over and amongst the feathers or fur, as the case may be: pack up carefully, and the game will be preserved fresh and sweet in the most unfavourable weather. Game sent open and loose cannot, of course, be treated in this manner; but all game packed in boxes or hampers may be deodorised as described. A tea-spoonful of coffee is enough for a brace of birds, and in this proportion for more or for larger game.

Fresh-ground coffee may be used with advantage in a sick room; a few spoonfuls spread and exposed on a plate: burned by a red-hot iron it is a safe and pleasant fumigator.

Should any of our sporting friends care to send us any game from the moors, we hope they will not forget the coffee.

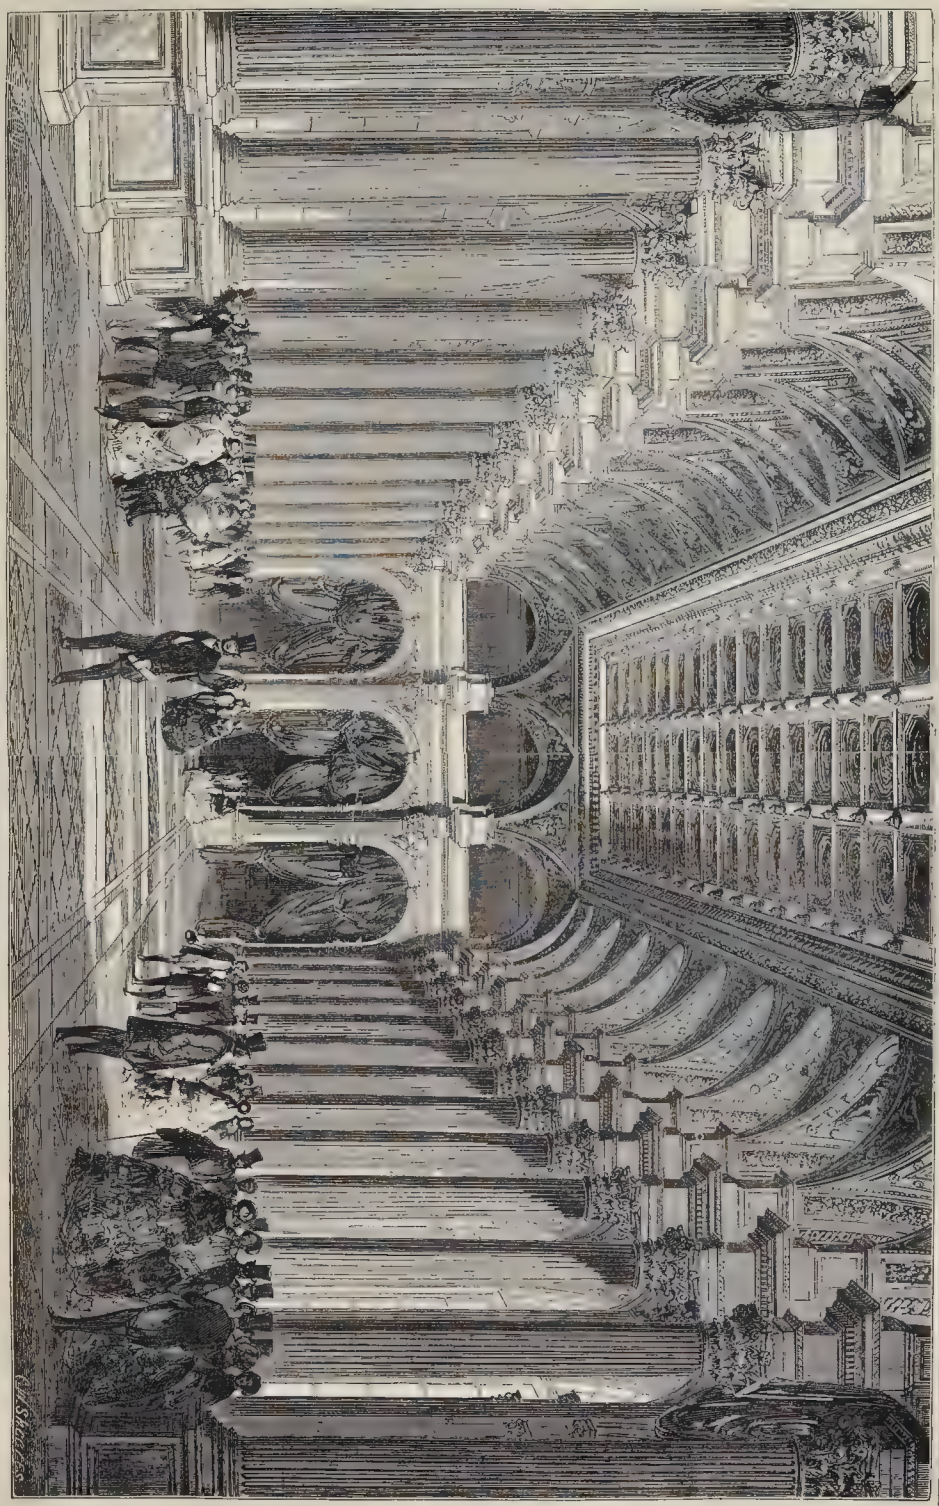
"SEWERAGE AND STORM WATERS."

The question of sewerage still continues the theme of the day, and, undoubtedly, much practical science was to be developed to perfect a system of town and local drainage. The most economical course for the general sewerage and drainage of a district is of paramount importance, more particularly in extended flat districts, where artificial means must be resorted to, and expense in perpetuity incurred, for raising and disposing of the sewerage. Having given much attention to the separation of surface drainage and storm waters, from the general sewerage of a district, I am led to the conclusion that such would be attended with good results, and a large outlay of capital may be saved in projecting new works. Practice confirms the area of sewers to be determined in accordance to the maximum quantity of sewage to pass through them, to which must be added a greatly increased area to provide for storm waters. But why incur such an expense in the discharge of storm waters, when nature allows of so many sources of exit?

I would suggest the surface drainage and storm waters to be so collected by a series of terro-metallic pipes, having established communication with the sewers, that they may be flushed as circumstances require, and natural outlets made use of for the discharge of these waters; thus saving, particularly in low-land districts, excess of area in the required sewers, an unnecessary area in storage reservoirs at the termini, and, above all, much of the unavoidable expenses in pumping-apparatus. In the first outlay the saving in the sizes of the sewers would much more than cover the required outlay for a trunk and intercepting line of pipes; and for the purpose of discharging the first hour's flush of street *débris*, in heavy rains and casual storms, I propose, as a substitute for the ordinary street gullies, to introduce a circular well, say, 2 feet 6 inches in diameter, and 3 feet 6 inches deep; the bottom being a cast-iron basin, having a 6-inch aperture into a culvert communicating with the sewer, the aperture to be closed by means of an ordinary wooden plug, coated with gutta percha. Through this well the storm waters line of pipes would pass, an aperture being provided for the water to flow from the well into the pipe, on plugging the iron basin after disposing of the street refuse-matter. The well would always be charged with water to the level of the aperture into the pipe, and thus most effectually suppress the return of nauseous vapours from the sewers. A series of stop-cocks for flushing the sewers at will, and making use of every natural outlet for the discharge of the water, carries out my idea.

George Augustus Dixon.

GALLERY, HÔTEL DE VILLE, PARIS.



The first stone of the Hôtel de Ville, at Paris, was laid on the 15th of July, 1533, by the *prévôt* of the merchants of Paris. The original design, in the Gothic style, however, was not advanced in execution beyond the second story; a new project having been presented to Henry II. in 1549, by Domenico Baccadoro, called "of Cortona." The work then proceeded slowly, and was not completed till 1609, under Henry IV.—and then, even, did not include more than a fourth of the existing building. The main building—flanked by two pavilions with high roofs—was in two stories, surmounted by a balustrade, and had an elegant bell-turret, decorated at the base with allegorical sculpture. Two ranges of superimposed composite columns enriched the façade,—each intercolumn of the one-pair story having a niche, now filled with sculpture. Above the gate of entrance was placed an equestrian statue of Henri Quatre, in gilt bronze, by Biard. This statue was said to have been destroyed during the Revolution, but was replaced in the reign of Louis XVIII. Sculpture, also, was inserted in the tympana of arches to other entrances; and altogether an elegant and picturesque combination was realized by the general design, with the high-pitched roofs having lucarnes richly ornamented. The *façade* remained till 1830, as Domenico da Cortona had left it.

Under the reign of Louis Philippe, the accommodation of the Hôtel being found deficient, the architects Godde and Lesuer were charged with the direction of great works for the completion and enlargement of the building. In these, they observed as much as possible the style and decoration of the work of Domenico da Cortona. To the building which has been described, they added upon the principal *façade* two new blocks of building, connected with the original pavilions. The eastern façade is copied from that of the west, omitting the bell-turret, and the high-pitched roof.

The halls of reception are situated in the one-pair story, next the quay and the square, and consist of the "Salle du Trône," the "Salle des Arcades," the "Salle de l'Empereur," and the Yellow and Blue *Salons*, the two "Salons des Arts," the "Salle des Cariatides," the "Salle de la Paix," the two "Salons des Prévôts," and the grand "Galerie des Fêtes," of which we now give a view. This gallery is about 160 English feet in length, 43 feet 3 inches in width, and 40 feet in height. It is lighted from the street by thirteen windows, in arcades. The decorative character of the gallery is given by an order of Corinthian columns, serving as the support to the cove which carries the *plafond* or ceiling of the hall,—the tribunes, or window recesses, being arched over from column to column, the arches breaking with the cove. The tympana or spandril spaces in the cove, between the archivolts, are designed to receive painted figures. The general decorative enrichment is in white and gold.

The gallery communicates with the "Salle des Cariatides," and opens upon the grand staircase,—thus, during a *fête*, a grand effect is realized by the spectator.

New Mansion at Curraghmore.—The Marquis of Waterford is going to erect a costly mansion at Curraghmore, near Waterford.

GALLERY, HOTEL DE VILLE, PARIS.

METROPOLITAN BOARD OF WORKS AND THE DISTRICT SURVEYORS.

At the last meeting of the Board a recommendation from the superintending architect, to the effect, that the district surveyors should be ordered to report *quarterly* to the Board, and also to the Vestries and District Boards, in terms of the statute, 103rd section, Local Management Act, all cases in which underground rooms or cellars are let or occupied as separate dwellings, contrary to the provisions of the statute, was received, and will be brought up for confirmation at the next meeting. Surely, the district surveyors should have had some opportunity afforded them, to make a statement on this subject to the Board before such a determination was come to. It is true the Local Management Act directs, that the district surveyors shall, without fee or reward, report as to such dwellings at such times as the Metropolitan Board "may" order, but it was always felt that the duty being altogether different from that which properly belongs under the Building Act to the district surveyors, appertaining rather to the police or inspectors of nuisances than to structural surveyors, the Board would be led to place the matter on some other footing. To perform the duty strictly, in some districts, would positively absorb the whole time of the district surveyor; because, inasmuch as the Act sets forth, that "every room or cellar in which any person passes the night, shall be deemed to be occupied as a dwelling within the meaning of this Act," the supervision would require to be constant.

It is to be hoped that the Board will reconsider the matter before coming to a determination.

FOREIGN AND COLONIAL NEWS.

Assyria. — The well-known M. Kiepert, of Berlin, has delivered a public lecture on the survey of Assyria, made by English engineers (scale $\frac{1}{1\,000\,000}$). It comprises that portion of the country where the well-known antiquities have been discovered, and which extends over an area of 30 square miles. The map shows about sixty ruin mounds, scattered on the banks of the Tigris; and there are added large plans of the ruins of the large cities of Nineveh, Nimrud, &c. As the size of Nineveh has been accounted far too large by the ancients, Ktesias and Strabo, as it is only half the size of Berlin, and about that of Cairo — the plan of Rome by Blondel may lead to interesting comparisons.

Swiss Industrial Exhibition.—There will be an exhibition at Berne for 1857. The Central Government of the Republic has granted 30,000 francs, the municipality of Berne 2,000 francs, and the subscriptions hitherto amount to 40,000 francs. The necessary steam power will be provided for the motion of machines, &c.

Bavaria.—Roman Ruins.—By the sinking of a well near Ingolstadt, adjoining the Devil's Wall (*vallum Romanum*) and the old Roman road, part of a mosaic pavement, several canals, and a *compluvium* (reservoir of rain-water), were discovered. The excavations, made most carefully, have exhibited a pavement of great beauty, the hitherto exhumed area of which exceeds 800 square feet. The designs represent marine deities, tritons, nymphs, riding and aquatic animals, &c.

Trinidad.—The great Asphalte Lake.—This curious lake lies near the village De la Brave, the houses of which are built of asphalte. Not far off are also springs of natural naphtha. Combined with sand and rubble, the asphalte forms a good paving for the city of Puerto de Espagna. It is intended now, however, to utilize it on a large scale, and by mixing the asphalte with chips of wood, to obtain every year 5,000 tons of a superior fuel, by which the West-India steamers could save much of the coal they are obliged now to carry with them from England.

Bavaria.—Practical Education of the People.—The King of Bavaria has ordered, by the Secretary of State for Home Affairs, that the places where Roman roads have been discovered, as well as the localities where Roman mosaics or other antiquities have been found,—in fine, all ancient camps, amphitheatres, &c. shall receive substantial tablets, for properly fixing the attention of travellers as well as inhabitants. These tablets have also to contain the date and other short particulars about the historical remnants thus marked for public attention. [This example ought to be followed.]

Sydney University.—The Legislative Council of New South Wales have made ample provision for this head educational establishment of the five confederated provinces of Australia. The architectural plans, now in this country for professional inspection, are said to exhibit thought and art. The Sydney Legislature have granted an area of some twenty acres of land to the university, so much indeed, that extensive plantations, like the old *Academy* of Athens, will surround it, and make it worthy of its high destiny. Upwards of 100,000*l.* have been already voted for the building, library, &c. Dr. Charles Nicholson has been elected the first president of Sydney University.

Important Invention in Stereotypy.—One of the persons employed in the State's printing-office of Vienna has made the discovery that plates of plaster of Paris will *uniformly* contract by a repeated washing with water, and still more if with spirits of wine. On this is based a process to produce both print (*Drucksachen*) and wood-cuts in various gradations of type and size, by a calculated diminution of the plaster of Paris plate. Already print and drawings have been made of a twelfth-part size, reduced from 3 inches to 1 inch in diameter, and yet even the reduction to the smallest size does not encroach on the perfect correctness of the impression.

SCENERY AT THE PRINCESS'S THEATRE.

MR. CHARLES KEAN, in the production of Sheridan's "Pizarro, or the Spaniards in Peru," has achieved another legitimate and very great success. If we are to judge from the manifestations on the first night, we may augur for it a run equal to that of the play which preceded it. In the production of this piece, the manager has not failed to avail himself of all available information, and to set forth the actual state of the people. As Mr. Kean writes in his fly-leaf, "Pizarro and his followers had found the kingdom of the Incas inhabited by an industrious, disciplined, population, united under the sway of a paternal government, possessing numerous works of art, and many national memorials. While Nature appeared to revel in her grandest and most picturesque aspect, the land abounded with precious gems and metals, to such an extent, that amidst the gardens of temples and palaces, trees and plants of gold and silver, most exquisitely manufactured, stood intermingled with natural productions. Birds of the same costly materials were seen upon the artificial branches, and the interior of the great Temple of the Sun, the most magnificent structure in the New World, was probably unsurpassed in the richness of its decorations by any building in the Old."

"By the recent excavations in Assyria, entombed races were raised before the eyes of the living; while, through the adventurous and unscrupulous spirit of the Spanish conquerors of America, in the sixteenth century, vast nations, buried in obscurity, unknowing and unknown, were revealed in active existence, occupied with the pursuits of cultivated life. We read, with surprise mingled with awe, of an extensive empire, whose mysterious origin is lost in the labyrinth of ages, confined within its own limits, seeking no external intercourse,—of a people dwelling in towns and hamlets, clustered amidst orchards and gardens, constructing canals and subterraneous aqueducts, carrying roads over plains and across mountains, forming beautiful terraces on the sides of the Cordilleras, which bloomed with every variety of vegetation,—rich in flocks, that supplied garments of the finest wool, victims for the altar, and viands for the banquet,—erecting palaces for their Incas, and temples for their God, with a profusion of wealth within the walls that almost rivals the marvels of Arabian fable,—and, what is most remarkable, enjoying the intellectual and refined amusement of a poetical drama."

The play involves less architectural scenery than preceding revivals, but due attention has been paid to correctness where it has been introduced. There is a marked difference between the remains of buildings existing in Peru and the extraordinary monuments of Central America; and this has not been lost sight of. Mr. Fergusson, in his excellent "Handbook of Architecture," has a discriminating chapter on this subject, wherein he points out, among other things, the remarkable similarity in style that exists between some of the Peruvian buildings and the Pelasgic remains of Italy; but it would take us from our present purpose to pursue it.

The sun being the great object of adoration amongst the Peruvians, the luminary has been looked to for the main scenic effects in the piece; and the new lights which science has given to the drama have been brought in powerfully to aid them, as in the second scene of the second act, "The Interior of the Temple of the Sun;" and again in the fourth scene of the third act, "The great Square of the City of Cuzco," where the rising luminary, first touching the distant cordilleras, and then the gnonoms set up in front of the temple to receive its early rays, ultimately renders the whole scene a blaze of light and splendour. The gardens of the royal palace, with its raised terraces forming a pyramid in stages, and some of the mountainous landscapes, are especially beautiful. Mr. Grieve has executed much of the scenery with his own hand, and has been ably seconded by Mr. Gordon and Mr. F. Lloyds. Mr. Kean's *Rolla*, and Mrs. Kean's *Elvira*, are admirable pieces of acting: the former threw an amount of energy and power into the part, which those who best know the labour, care, and anxiety that must fall to the manager in such a production of a play, will most wonder at.

The grouping throughout is beautiful, and presents a series of artistical pictures; for example, at the death of Orozembo (very effectively played by Mr. John Cooper), when the Peruvians are waiting with outstretched arms for the appearance of the sun, and the return of the warriors to the women in their rocky retreat.

SINGULAR INSTANCES OF SPONTANEOUS (?) COMBUSTION AT BEDFORD.

WITHIN the last week or two great excitement has prevailed at Bedford, in consequence of a series of separate and distinct fires, about forty in number, having successively broken out in a house in Horn-lane there.

The house is inhabited by a person named Morton, a commercial traveller, and his family. In the absence of her husband from home, Mrs. Morton had fumigated the house with burning sulphur, with a view to get rid of a notorious domestic pest—better known, perhaps, in London, than even in Bedford. By some accident a vessel containing the melted roll sulphur leaked, and the sulphurous fluid escaped into a basinette, burnt through the bottom, fired the floor, and ate its way through the planks. Timely observation and alarm availed to arrest the progress of this fire, and all was deemed safe.

"An hour and a half," says the *Bedford Times*, in narrating the circumstances, "served to dispel this delusion: the mattress, feather-bed, and the contents of a chest of drawers, successively took fire, and caused great anxiety in the minds of the household, who remained up the whole of the night. No more outbreaks occurred that night; but on the following morning, about eight o'clock, some dirty linen in a room up stairs was discovered to be on fire. The flames were subdued, and the damaged articles thrown into the yard. The premises were strictly watched, but no more fires took place on that day, and it was then thought that no further danger was to be apprehended. In the meantime Mr. F. Howard communicated with Mr. Morton, who returned on Saturday. No outbreak had occurred since the previous Wednesday morning, but Mr. Morton, before retiring to rest on Saturday evening, threw his stockings and other wearing apparel, which were damp, on the carpet in the parlour, and on the following morning, to his astonishment, they were found burning. The marvels of the previous Tuesday evening were then resumed. About eight o'clock a fire was discovered in the boy's room, as well as in the bed on which the master and mistress of the house had been sleeping. Soon after a succession of fires took place, not only in every room and closet in the house, but from drawers, boxes, and cupboards smoke and flame were seen to issue in the most extraordinary manner. Several gentlemen and friends of the family were called in to witness the wonderful phenomena, and many of the outbreaks occurred in their presence; but all attempts to unravel the cause of the fiery visitations proved unavailing. Indeed, the fires took place so rapidly and in so sin-

gular a way, not only with respect to articles belonging to the occupier, but the handkerchiefs of some of the visitors were scorched by contact with the inflammatory spirit which seemed to pervade every part of the house, until at length the parties began to fear for their own personal safety, and to ask themselves whether they were not about to become the victims of spontaneous combustion. Dr. Barker, whose advice was sought on the Sunday, visited the premises again on Monday with Mr. Blower. As the cause of the fires seemed to be wrapped in the greatest mystery, the two medical gentlemen waited upon the magistrates who were then sitting in Petty Sessions at the Shire Hall. Mr. Blower briefly related the circumstances of the mysterious fires, and suggested to the Bench the propriety of holding an investigation by Mr. Eagles, the borough coroner."

An inquest was accordingly held, and after a good deal of evidence had been heard, the jury, having consulted about half an hour, returned the following verdict:—"That the fire on Mr. Alfred Morton's premises was accidentally caused by incautiously placing and setting fire to a quantity of brimstone in a pot, the same being placed in a bassinet situate on the first floor of the said premises; but as to the cause of the continuation of fires on the said premises, we have not sufficient evidence to show."

In course of the inquiry, a chemist and druggist deposed to his belief that the fires were produced by spontaneous combustion. Dr. Barker gave his opinion that "there was a something pervading that house which produced spontaneous combustion." Mr. W. Blower, surgeon, said, "there was something in the atmosphere which caused the spontaneous combustion which has been spoken of."

The prevalence of thunder, and the consequent production of an abundance of ozone or active oxygen in the atmosphere this year, may have rendered this a summer predisposing to spontaneous combustion; but since the fumes of burning sulphur produce a smell precisely like that of ozone, may not the burning of sulphur in a confined atmosphere, in such a summer as this, have doubly charged that atmosphere with ozone itself, and so predisposed combustible materials in the house for a time to take fire spontaneously? There may have been some trickery at work, however, in the production of such unusual phenomena.

COMPETITIONS.

Windsor Cemetery.—Twenty designs were received by the Burial Board, and from these the committee have selected one, with separated chapels, by Messrs. Poulton and Woodman, estimated to cost 1,350*l.* The chapels are in the Decorated style of Gothic architecture, and are intended to be constructed of rag stone with Bath stone dressings. At each end of the buildings are large traceried windows. The roofs are to be open, and, as well as the internal fittings, to be stained and varnished. The episcopal chapel has, over the entrance, at the north-west tower, a bell tower, terminating in a light spire of considerable altitude. One of the leading features in the Dissenters' chapel is an ornamental timber porch. A robing-room is provided for each of the chapels. The stone panelling under the windows, is arranged so as to receive tablets for monumental inscriptions.

COMPETITIONS IN IRELAND.

Naas Gaol.—The premium of 50*l.* for the best plans for enlarging and improving Naas Gaol, has been awarded to Mr. John M'Curdy, of Dublin. The plan adopted proposes the erection of a new wing, giving the requisite increased accommodation on the separate system. The old wings are to be connected by corridors to the central building, which is to be converted into an inspection hall; the whole to be open from ground-floor to roof, with iron galleries to each story. The cost will be about 9,000*l.*

Londonderry.—A new bridge is to be built at Londonderry, for which premiums of 200 and 100 guineas are offered respectively for the first and second best designs. Sir William Cubitt is to decide.

CAST-IRON PILING.

The first application of cast-iron piling is due to the late Mr. Robert Sibley, who employed it for the first time at the Island Lead Works, Limehouse, the brick-faced wharf having given way, and it was entirely successful. Mr. Sibley was then employed by Mr. Chadwick at Fenning's Wharf, London-bridge, which he supervised, and notwithstanding the considerable depth of water, and tide, made a successful work of it. Shortly afterwards, Mr. James Walker, slightly modifying only the form of pile, and using sheet-piling, executed the Blackwall Wharf.

Mr. Sibley designed several bridges, which he proposed to execute in this way, as also to repair existing ones, without having recourse to coffer-dams. He had a favourite idea that the embankment of the Thames might be successfully carried out in this way.

In cutting into this work (iron piling), it has been found that an intimate chemical union has taken place between the lime in the concrete backing and the iron piles and plates,—so much so that the lines of separation could not be traced, the whole forming one solid mass.

No appreciable effect after the first oxydization has been observed on the face of the iron. The ends of the piles were not pointed, but square, for driving.

Palmam qui meruit ferat.

SIR C. BARRY AND THE GOVERNMENT.

ARCHITECTS' REMUNERATION.

All members of our profession must agree with your remark that we all suffer by the very illiberal and government-like treatment to which Sir Charles Barry has been subjected; and as Sir Charles in his letter says that he accepts because "it is evident that no *individual* could with the least chance contend against the Government," I beg to propose, through your columns, that a subscription be immediately set on foot to support Sir Charles in any legal opposition to such piratical treatment. I am only a poor member of the body, but there are, I believe, now rather more than 8,000 of us in the kingdom, and, as a nucleus, I enclose you my name for 5*l.*

A Country Architect.

*** The question has been closed by Sir Charles, but we print the foregoing to show the feeling of the profession.

I hope you will print the *reply* of the honorary secretaries of the Royal Institute of British Architects (July 24, 1856) to Mr. Wilson's special pleading letter of July 15 to them, already published by you, just to show that the council have not been hoodwinked by his Jesuitical arguments in the Westminster Palace matter. Architect.

The reply in question, after acknowledging receipt of papers mentioned in Mr. Wilson's letter, says,—

"Both these documents will be submitted to the council of the Royal Institute of British Architects at their next meeting: the correspondence embodied in the latter has, however, already been before them, and it was only after a careful examination of the whole of the Parliamentary Papers connected with the subject that the council arrived at their own conclusions thereon, and framed and unanimously adopted the resolution in question."

In the Parliamentary paper wherein this reply is printed, it is headed, "From the Royal *Society* of British Architects, to James Wilson, Esq. M.P." This want of correctness, of which there were other instances in the letter we have already printed, does not convey a very elevated impression as to the mode of conducting business at her Majesty's Treasury.

RECENT PATENTS.

The following are selected from the lists of recent patents published in the *Mechanics' Magazine*:—

Swinburne, R. W. Improvements in furnaces used in the manufacture of glass. Dated Nov. 17, 1855. (No. 2595.) The inventor makes outlets or openings in the sides or ends of a furnace, or in both the sides and the ends, near to or a little above the level of the siege or floor of the furnace upon which the cuvetts or pots are placed, for the purpose of causing the heat or heated air proceeding from the fires to be drawn across the siege in such a manner as to act upon the body, or upon the lower part of the cuvetts or pots, in a greater degree than in furnaces of the usual construction.

Barbier, C. J. An improved kiln for burning or firing pottery, bricks, tiles, and other earthenware. Dated Nov. 28, 1855. (No. 2683.) This invention is grounded on the use of a moveable furnace, conveying successively the heat through all the parts of the materials to be burnt, and on the continuous action of the gases, which successively circulate through a number of laboratories, their temperatures decreasing as they get farther from the fire, thus completing the burning of such articles as are nearest, and at the same time progressively preparing the others.

Marguerite, L. J. F. Certain improvements in the manufacture of vitreous products. Dated Nov. 12, 1855. (No. 2537.) The improved vitreous compound contains some silica and alumen, but neither potash nor soda: this want constitutes the chief character of this invention. For instance, by calcining a mixture of silica 65·47, lime 25·80, alumen 8·73, a perfectly transparent glass is obtained.

Coignet, F. Certain improvements in the use and preparation of plastic materials or compositions to be used as artificial stone, or as concrete or cement for building and other purposes. Dated Nov. 26, 1855. (No. 2659.) These improvements relate to various combinations of sands, gravel, broken flint, broken stone, burnt or unburnt soil, cinders, and coal refuse, scoria, wood-ash, dross, with unctuous or hydraulic chalk, &c. and very fine sand, and in the employment of such matters when compounded in the formation of houses and other buildings. The matters to be mixed are pounded together, and when used, the desired forms are given by moulding and compression on the wall, or other formation, repeating the operation till the structure desired is obtained.

Clerville, J. J. C. de [not proceeded with]. Improvements in preparing oil with other matters for painting. (A communication.) Dated Nov. 26, 1855. (No. 2663.) Linseed oil is first boiled with peroxide of lead and sulphate of zinc; then a quantity of rosin and bee's-wax is dissolved therein; next a quantity of caustic alkaline solution is added—say about twice as much as there is oil—and the whole compound or mixture is boiled for a time, after which some essence of thyme is stirred in, and the whole is allowed to stand, and is afterwards filtered.

Cottsell, G. An improved gutter and kerb for roads and streets. Dated Nov. 7, 1855. (No. 2496.) Claim—Constructing a gutter and kerb of a hollow box or pipe, with a lateral grating, or series of apertures for the admission of the water and surface drainage, and for preventing the entrance of large solid substances.

Wilkes, J. G. Improvement or improvements in the manufacture of tubes of copper and alloys of copper. Dated Nov. 26, 1855. (No. 2657.) This invention consists in forming the said tubes by passing hollow cylinders between rolls furnished with grooves of a nearly semi-circular section, the grooves being somewhat less deep than they would be if their section were truly semi-circular.

Eassie, W. Improvements in hammers. Dated Nov. 16, 1855. (No. 2585.) This invention relates to a "friction hammer." The principle carried out is, the obtaining by means of nipping action the elevation and release of a vertical rod or bar of iron, the lower extremity, which is shaped as a hammer head, performing the functions of a hammer.

Jeffreys, E. An improvement in the construction of furnaces. Dated, Nov. 6, 1855 (No. 2495). Instead of setting all the fire-bars in the same horizontal plane, the patentee arranges them at different levels, rising from the central group to the sides, or from the sides to the central group. These fire-bars he mounts in a rocking frame, capable of being rocked by the stoker on the trunnions which support it, and thus of changing the level of the fuel.

Jessop, J. Improvements in the construction of furnaces and boilers. Dated Nov. 6, 1855 (No. 2488). This invention consists—1. In the employment of a number of discs or wheels, fixed at suitable distances from each other on a shaft, capable of rotating, and applied to the back part of furnaces betwixt the grate-bars and the bridge for receiving the clinkers, &c. when pushed from the grate-bars, and carrying the same forward at intervals to the ash-pit underneath. Also in the use of a diaphragm to separate the discs and ash-pit from the ordinary grate-bars and ash-pit, with doors, dampers, or valves, to regulate the admission of air thereto. 2. In constructing boilers with a water space projecting over the back part of the grate-bars, forming an inverted bridge to the furnace in front of the ordinary bridge, and immediately above the before-mentioned discs, the purpose of which is to deflect the smoke down into close contact with the fuel and clinkers at the back part of the furnace and on the discs.

Davis, W. Improvements in the construction and arrangement of furnaces and furnace-bars for the better combustion of smoke and prevention of loss of heat by radiation. Dated Nov. 7. 1855. (No. 2503.) This invention consists — 1. In constructing some of the bars of a furnace with deep flanges or projections in the direction of their length, on the upper part of the bar, carried as high as the top of the fuel, and so that when two such bars are placed together, an air channel or space is formed between them, for the passage of air to the upper part, or above the fuel in the furnace. The patentee also constructs furnace bars, with an upturned part at the back end, the whole forming a bridge at the throat of the furnace. 2. In placing a cellular construction on the interior of the furnace-door, and admitting continuously to such cells a sufficient quantity of air through the door, to maintain the interior of such cells as are next the door at a low temperature. The introduction of air at the fire-door is to prevent radiation of heat.

Pitman, J. T. Improvements in the construction of iron beams and girders, and in machinery for making the same. (A communication.) Dated Nov. 15, 1855. (No. 2574.)—The improved beam or girder is formed of a single bar of sheet or wrought iron brought to the required form by a series of consecutive swaging operations performed by certain im-

proved machinery. The side elevation of the beam is a parallelogram, and its cross section shows a pair of flanges at bottom from which rise the closed sides of the beam, surmounted by a tubular arch. The flanges rest at the ends of the beam upon the walls of the building, and form, throughout their length, abutments for the support of an arched fire-proof flooring and ceiling. The machine for making this beam or girder, consists of a series of pairs of rolls, or revolving swages and dies, arranged to act consecutively and automatically upon the iron. [Patent not proceeded with].

METROPOLITAN BUILDING ACT.

IN this badly and loosely drawn up Act, let me call the attention of the profession to some strange omissions,—very proper provisions existing in the former Act, 1844.

1. No person was allowed to break an opening in any external wall overlooking his neighbour's premises: if he did, a month's notice, and it was set right. At present there is actually no provision on this head.

2. Party-walls were most properly deemed to be walls dividing premises in different occupations, standing half on one ground, half on the other. At present a party-wall is only deemed to be so when it divides *buildings* in distinct occupations. Why, in the name of common sense, is not a wall, dividing a building and ground in distinct occupations, a party-wall? It is so, to all intents and purposes. A party-wall included a party-fence wall, *i.e.* a party-fence wall and a party-wall were one. This will be a fertile source of mischief. Party-fence walls are now ignored altogether.

3. Pray, why were all the scheduled forms of notices omitted? If a joke, it is a bad one. No part of the present, but what in some other part it contradicts itself. AN ARCHITECT IN A FIX.

BRIDGE BUILDING.

Permit me to say, in some corner of your journal, that the articles you have given on bridge foundations have led me to think whether it might not be possible even yet to construct foundations, where desired, literally imperishable.

Now I fancy that, within a coffer-dam, a pile of *unburnt* bricks might be raised, in proper order, with breeze, treated as a clamp, of the size and form for the required foundation, to a little above the high-water mark, and *then* burnt to a heat beyond that required for bricks, so that all might *unite together*, as we sometimes see a few accidentally joined in the firing. Then the air-channels might be grouted with fine concrete, to make the bed more solid, and prevent the sub-earth rising into them.

Or perhaps our giant engineers would as readily build and burn it on a floating iron platform, and then sink it gradually; in which case the town might be saved the nuisance of the firing, by its being done elsewhere, and floated afterwards to its place.

Now, if this be practicable, instead of placing dependence on rotting timber, or on decaying stone or rusting iron, it might be reposed in a fire-made rock that would defy both current and cannon as long as the existence of the people it serves.

Although apart from this point, may I name another thought? I do not suppose it new: that of forming a platform in the centre of the pier, suggested by the frequent perforating arch, for steamers' landing-place, connected by stairs with the road level of the bridge, so as to serve for either side of the water. OLIVER P.

Notices of Books.

Inventorium Sepulchrale: An Account of some Antiquities dug up at Gilton, Kingston, &c. in Kent, from 1757 *to* 1773, *by the Rev. Bryan Faussett.* Edited from the original manuscript in the possession of JOSEPH MAYER, Esq.; with Notes and Introduction. By CHARLES ROACH SMITH. Printed for subscribers only. London. 1856.

LAST year, as many of our readers know, the manuscripts and antiquities of which this is the history, passed into the hands of Mr. Joseph Mayer, of Liverpool, by purchase from Dr. Faussett's executors. Mr. Mayer lost no time in arranging and throwing open to the public his important acquisitions, and at once resolved on printing and illustrating the manuscripts for the public behoof. The conduct of the trustees of the British Museum in neglecting to secure the Faussett collection of Anglo-Saxon and Roman antiquities,—so suitable, nay, so indispensable as such British antiquities must be to a British museum,—was quite inexcusable, and has been the means of depriving the nation of other collections, such as that of Mr. Wylie; but it is fortunate for the country at large, that the Faussett collection did not share the fate of other antiquities rejected by the same trustees, and become lost to us either by transportation to a foreign country, or by dispersion in our own at public auctions: it is still more fortunate that this collection has passed into such hands as those of Mr. Mayer. Had the Government, moreover, been induced to accept the offer made by Dr. Faussett's executors, the manuscripts would probably have remained a sealed book to the public; whereas we have the whole here already, comprised in a handsome quarto volume, illustrated with numerous engravings, many of them in colours, and preceded by an Introduction, from the able and accomplished pen of Mr. Smith, who took so much interest in the unavailing endeavour to open the eyes of the Museum trustees to their manifest duty as the collectors and preservers—beyond all else—of our *national* antiquities.

On the Physical Conditions involved in the Construction of Artillery, with an Investigation of the Values of Materials and Causes of Destruction of Cannon in Service. By ROBERT MALLET, M.I.C.E. F.R.S. &c. London: Longman and Co. 1856.

Illustrated Handbook of Military Engineering and of the Implements of War, for Non-professional Readers. By R. FORREST, Woolwich. London: Day and Son, Lithographers to the Queen.

THE former and more important of these works on the strength, form, and general construction of ordnance, and its improvement, is based on investigations first made public at the Royal Irish Academy in course of last year. Circumstances had led the author to the conviction that the manipulative skill of the gun-founder and the practical resources of the mechanical engineer were insufficient to supply any certain basis for advancement in the construction, power, and endurance of cannon, or to explain its mishaps and accidents; and that a *science* of gun-founding yet required to be formed and systematized,—a science which must be founded and established on a more searching and exact discussion of the properties of the constructive materials for ordnance than as yet appeared to have been given by any one. The work therefore necessarily contains much matter of interest to the civil engineer as well as to the military, on the strength and qualities, chemical and mechanical, of iron and brass, and on moulding, casting, and founding in general,—whether of cannon or of other heavy works in metal. The book is illustrated by various engravings, as of the peculiarities and changes of structure in iron, taken from photographs, as well as of other subjects more strictly professional. The smaller work under notice is expressly designed to render intelligible to non-professional readers the various necessarily technical expressions found in all historical or popular descriptions of modern warfare; and, although scarcely so timely in appearance as was probably anticipated when the plates and descriptions were first thought of, it is to be hoped the public will *not* lose their interest in such subjects, since it is hard to say how soon they may have a recurrence of occasion to desire a little special information as to the technical language of military engineering, war-implements, and warfare.

Miscellanea.

ELECTRO-TELEGRAPHIC.—We regret to learn that another submarine cable has been lost in the Mediterranean, between Sardinia and the African coast, during a storm. It was insured at Lloyd's for nearly 30,000*l*. Surely some better method of laying down submarine cables than appears to have as yet been adopted might be devised. In the event of a storm occurring could not the cable be cut and buoyed in some conspicuous way, so as to enable the vessel containing the remainder to recover the cut end and restore the connection at a future time? The cable just lost was between 120 and 130 miles in length, the distance between Spartivento and Tunis being 109 miles, and the Mediterranean irregular in depth.

GIBSON'S STATUE OF THE QUEEN.—The statue of her Majesty, which has been sculptured in marble by Mr. Gibson at Rome, has arrived in this country, and is now being placed on the pedestal allotted to it in the Prince's Chamber, in the New Palace of Westminster. This apartment is at the back of the throne. The pedestal on which the statue is being placed is of solid marble. The three emblematical figures on the base, representing Astronomy, Commerce, and Architecture, are also from the chisel of Mr. Gibson. Mr. Gibson has made up his mind to *colour* the group. It is much too large for its position.

INAUGURATION OF THE WELLINGTON STATUE AT MANCHESTER.—The Wellington statue (described in our last number) was inaugurated on Saturday last, in the presence of 20,000 spectators. The statue is a companion to the Peel statue, which has been raised higher on its pedestal, and both are placed in front of the Manchester Infirmary, which is erected on the finest site in Manchester. The mayor and corporation of Manchester, the Bishop of Manchester, Lieutenant-General Sir Harry Smith, the executive committee, the 7th regiment of Dragoons, and the 25th regiment, or Queen's Own Borderers, assisted at the ceremony. Mr. Noble had superintended the erection of the figures during the last fortnight, great care being required in fixing the bronze figures at the angles of the pedestal. These are of great weight: they were cast by Messrs. Robinson and Cottam, founders, Pimlico, and brought to Manchester without accident by the London and North-Western Railway. The statue of Mars at the left front angle of the pedestal is itself 10 feet high, while the main statue is only 13 feet high, and must, one would think, from its position on a pedestal 19 feet high, lose even some of the small predominance over its subordinate which it in reality possesses.

THE PEEL STATUE AT MANCHESTER.—The Peel Monument at Manchester has been elevated 3 feet 9 inches. Mr. William Buxton, builder, performed, by contract, the task of removing the statue, and re-erecting it, happily without accident. The work occupied about a week. An additional layer of granite has been placed underneath, of the height mentioned, and 13 feet 7 inches long, by 7 feet 2 inches wide. The granite was brought from Aberdeen, carefully tied up in matting like a bale of goods. To produce uniformity, the old granite, which had become somewhat weather-stained, will be "rubbed" or cleaned; but the black, smoke-covered figures will remain as they are in the mean time, although it is intended to clean them, so as to be in accordance with the Wellington statue, we presume. The statue of Sir Robert Peel weighs three tons; and the top stone of the pedestal upon which his figure rests weighs seven tons.

COMPULSORY HOUSE DRAINAGE: HAMMERSMITH.—The authorities of Kensington vestry summoned Mr. W. Hedges to Hammersmith Police-court on 28th ult. for suffering a house, No. 7, Brown's-buildings, Kensington, to be untenable. From the statements of Mr. F. Godrich, the medical officer of health, and Mr. Biradbridge, the surveyor, it appeared that a quantity of liquid house-manure flowed from a dung-heap in the yard into the basement of the house and under the flooring of the kitchen, and had rotted the boards. What the officers required was that a drain should be made under the kitchen to carry off the water, the yard to be properly drained, and that there should be a water-supply to the offices. Mr. Godrich added that the woman of the house had been, and was now looking, very ill, and he considered the house untenantable from the want of proper drainage. The defendant said he had let the house to a man named Lever, who had promised to make all things comfortable. The magistrate, Mr. Dayman, made an order as required by the complainant.

THAMES TUNNEL.—In the week ending 30th August, 16,436 passengers passed through, and paid 68*l*. 9s. 8d.

THE MARYLEBONE FREE LIBRARY.—It is a subject of regret, and, indeed, of dishonour and shame to the metropolis, that it has but one free library, and that even this is in so languishing a condition, that it must be closed at the end of the present year, unless the annual subscriptions be increased by about 200*l*. Since its opening (not under very wise auspices or arrangements, certainly), in January, 1854, no less than 73,312 readers have attended it, and 79,477 books have been issued, down to 31st July last. It also contains a lending library of 1,000 volumes, established and conducted by working men, and in full operation, 5,732 volumes having been issued and returned without loss or damage. A special committee of gentlemen, unconnected with the library, but interested in its welfare, has been formed for the purpose of preventing, if possible, its threatened extinction, and it is to be hoped the metropolis will not incur the additional disgrace of not being able (or willing rather), to sustain the only solitary institution of this kind which it possesses.

Gas.—The Liverpool United Gas Company have just been dividing their usual handsome dividend of 10 per cent. per annum for the last half-year. The gas rental for 1856, notwithstanding the reduction of price from 4s. 6d. to 4s. in 1855, has already reached the amount of same rental in the year previous to the reduction, namely, 1854, and even exceeded it. The chairman declared that he was perfectly satisfied with the result, and that "in this as in every class of business in which men engage, those who supply good and cheap articles need never be afraid of an increase of production." We have not the least doubt of the rental being farther increased in the ensuing year.——The directors of the gas company at a place called Errol, in Scotland, not being yet converts like the Liverpool chairman to the right principle in gas statistics, lately attempted to increase their dividend of 6½ per cent. arising from the sale of gas at 10s. a thousand cubic feet, by *raising* the price to a still higher pitch, namely, 10s. 10d. The immediate result has been, that more than the one-half of the gas-consumers of the village have signed a document, binding themselves to give up the use of gas altogether till the company agree to reduce the price and to pay for replacing the meters.——The ratepayers of Salford have, in a public meeting, formally complained that the price of their gas has been raised 10, 20, and 30 per cent. without any increase of its illuminative power, and they seem to think they may as well have it cheap and bad as dear and bad. Mr. Rudd stated that the price per thousand feet in London was only 3s. 6d. although coals were so dear; that in Burnley the price was the same, and in Todmorden 3s. 8d. He complained that the Salford gas was impure, and that it was delivered at too high a pressure. They were paying 10 or 15 per cent. for gas which they did not consume. Mr. Storey said that the profits from the gas at the present time, if properly managed, would be from 120 to 150 per cent.——At a recent meeting of the directors of the Spilsby Gas Company, it was resolved to reduce the price of gas from 8s. 4d. to 7s. 6d. The company is now paying a dividend of 5 per cent. which will doubtless, as usual, increase as they diminish the price of their gas.——The York United Gas-light Company have resolved to divide 6 per cent.

Employment of Convicts. — In an article of your paper of last week, there was a hint on the subject of the Thames sewage, which pointed to employment of thieves in said dirty work. This was hitting the right nail on the head. I have given this same nail a blow or two myself, but it will take many more to drive it home, but when done, it will be a *clencher*. Some time since I addressed the *Times* on the subject in general, proposing that street thieves should be put to all the irksome and dirty work of the town. My letter was not inserted, but the hint was thought to be worthy of an honourable position in a leader. Dear sir, do contrive to give another blow on this nail. It may be rather out of your line, but it can be done. Thieves do not bargain for continuous hard work: put them in earnest to this, and the reformatory system will find much of their work done by this simple process.—H. B.

Stained-Glass Windows for Glasgow Cathedral.—At the request of the Lord Provost of Glasgow, Mr. James Ballantine, of Edinburgh, the artist, who was selected, in 1845, to fill the windows of the House of Lords, has submitted a complete plan of illustrations for the windows in Glasgow Cathedral, comprising the leading events recorded in the Old and New Testament. He has prepared the designs for the four principal windows: these are as follow:—*Large West Window.* — Christ's Entry into Jerusalem—Last Supper—Crucifixion and Ascension, or the Life of Christ, illustrated in a series of medallions. *Large South Transept Window.* — The Transfiguration, and Christ cleansing the Temple: the four lateral upright lights to be filled with Architectural Ornamentation, similar in character to the treatment of the large north transept window. *Large North Transept Window.*—St. John preaching in the Wilderness—Christ preaching on the Mount—The Day of Pentecost—The Angels opening the Prison Doors to the Apostles. *Large East Window.* — Effigies of the Twelve Apostles and Heads of Twelve Prophets, in Medallions, with geometric and foliated adjuncts. Mr. Ballantine urges that unity of purpose and harmony of connection can only be attained by placing the whole series for execution in the hands of one artist.

Colossal Bust of the Queen for Manchester Town-hall.—The bust commissioned by Alderman Barnes, from Mr. Noble, and for which her Majesty granted sittings, is now completed, and will be shortly placed in Manchester Town-hall.

A New Metallic Alloy.—Equal parts of iron, cobalt, and nickel, fused together, made a very hard alloy of dazzling whiteness, resembling silver. It is suitable for making knife-blades, fine files, and other such articles.

North Oxfordshire Archæological Society. —The members of this society had their annual excursion on Thursday and Friday in week before last, in conjunction with the members of the Worcester Diocesan Architectural Society. The North Oxon members halted for a short time at Swalcliffe, and after inspecting the church, proceeded to Brailes, where they were joined by the members of the Worcester Society. After a visit to the church, the whole party started for Compton Wyniates, the residence of the Marquis of Northampton. They were here cordially received by Lord A. Compton, who conducted them over the mansion, and showed them the various objects of interest with which it abounds, adding various explanations. The church was next visited, and the party then went on to Tysoo Church, and from thence to the Sun Rising, at Edge Hill, where they were met by Colonel North. Here the party dined. Warmington was the next halting-place: the church here was visited, and one of the Worcester gentlemen gave a short account of a curious portion of the edifice, supposed to have been used by a recluse. After visiting Shottswell, the party returned to Banbury. A meeting was held in the Vicarage-hall in the evening. The Rev. T. Chamberlain, vicar of St. Thomas's, Oxford, read a paper "On the Restoration of Chancels and Churches." This was followed by one from the Hon. F. Lygon, "On Mediæval Monuments—especially brasses," rubbings of which were hung round the hall. Mr. Faulkner, of Deddington, made a few remarks on the necessity of preserving the brasses in churches. Friday's excursion included Adderbury, Deddington, Somerton, Weston-on-the-Green, Middleton Stoney, Wendlebury, Alchester, and Bicester.

Woolwich: Government Contract.—Messrs. Lucas, brothers, of Lowestoft, builders, have concluded a contract with Government for the erection of a brick wall, 15½ feet in height, and 2 miles in extent, which is to inclose and connect the newly-acquired premises in Woolwich Marsh with the Arsenal. Great additions and improvements have been made throughout the entire circuit, so that the general aspect of the Arsenal is now that of a thoroughly new establishment, on a liberal and extensive scale. The works are being pushed forward with great diligence, many of the contractors' men working over-hours.

The Late Sir Richard Westmacott, R.A.—Sir Richard died at his town residence, in South Audley-street, on the 1st inst. in his 82nd year, after an illness of about three weeks' duration. Richard Westmacott was born in London, in 1775, and, showing early signs of his future vocation, adopted the profession of a sculptor when he was quite a child. In 1805 the Royal Academy of London elected him an associate of their body, and he became in 1816 a Royal Academician. The works of art by which he was best known are his statues of Addison, Pitt, and Erskine, his statues of the late Duke of Bedford and of Charles James Fox, in Bedford and Russell squares, and his monuments to Sir Ralph Abercromby, Lord Collingwood, and others, in Westminster Abbey and St. Paul's Cathedral, together with the figure of Psyche, much admired by every lover of art. Besides these he designed the colossal statue of Achilles, in Hyde-park. "The Distressed Mother," which he executed in 1822, for the Marquis of Lansdowne; "The Houseless Traveller," a copy of which is in Westminster Abbey; his "Euphrosyne," for the late Duke of Newcastle, in 1837. His latest work, we believe, was the sculptured pediment at the British Museum.

The Stereoscope.—A discovery of a curious character is announced by a M. Luegol, namely, an animated likeness, which takes us a step farther in photography, and surpasses even a "speaking likeness." M. Luegol takes two portraits for the stereoscope, each one at a different angle to the other, so that when they are placed in the instrument and it is moved from the right to the left, the eyes are in apparent motion.

Messrs. Broadwood's Fire — Workmen's Tools.—The *Builder*, in noticing this calamitous event, observes,—"Several hundred workmen will be thrown out of employment, and a great number have lost their tools, some of which were insured, and many not. It is much to be regretted that workmen will not adopt this easy mode of securing the value of their property. There is no difficulty whatever in doing so. It is a practice we have often urged, and we hope that experience, such as the present, will at length induce the general observance of tool insurance as a rule with but few exceptions." Why do not masters make it an invariable rule to include in their insurance the tools of their workmen, and if they think it necessary to make a deduction from the wages on that account, a penny or twopence a week, according to the value of the chest and the risk of the occupation, would defray the whole cost?—*Bury Post.*

Paper from Stone.—We are likely shortly, it seems, to be writing "with a pen of iron on the rock," in a sense very different from what Job or his comforters dreamt of, or the Assyrians, with their microscopic writings on tablets of pottery, practised. A Glasgow marble-cutter, grudging doubtless the immense waste of his material in useless chippings, is said to have invented and patented a process whereby stone is convertible into paper of a superior kind, both in texture and quality, to that now in use, and at a much cheaper rate. As stone, however, is only said to be "the principal material," we must infer that the *stone* needs *mortar* to hold it together: nevertheless, the saturation of some glutinous medium with stone dust *may* form a very fair succedaneum or substitute for paper. Mr. Edward Grecnless is the patentee.

Fatal Accident by Fall of Old Building.—On Tuesday night, about twelve o'clock, a house, No. 9, Little Swan-alley, Moorgate-street, fell, occasioning the loss of four lives, and severe injury to others. The whole of the occupants, sixteen in number, were buried in the ruins, so that it is wonderful more were not sacrificed. Some difficulty in shutting and opening doors had previously, it is reported, given warning of what might have been hence looked for, but the landlord, it seems, denies that any information of the circumstance had been given to him. The house was a very old one, of three stories, let out in rooms. Fortunately three rooms only were occupied. Decay of the beams and rafters is regarded as the cause of the accident. The alley contains a number of other houses of a like dangerous order, and is surrounded, indeed, by the same kind of buildings, all densely occupied.

The Sledge Principle in Railway Transit.—A correspondent, who subscribes himself "A Thoughtful Mechanic," suggests the substitution of the sledge principle in railway carriages in place of wheels, leaving the latter on the locomotive only, and describes the advantages of such a system, as in safety, facility of stoppage, &c.; but we fear it is but too manifest that the disadvantages arising from that friction to which some of these counter-advantages are due are too many to leave much chance of the substitution which our correspondent desires, however much the safety or smoothness and comfort of railway travelling would thereby be increased.

The Metropolitan Traffic Question: Scheme for Railway Intersections.—The absurdity involved in the idea that the metropolis of a country which set the example of railway transit to other nations, is still so utterly devoid of internal means of intercommunication at all equivalent to the immensity of railway traffic poured into its streets, that these may be said to be now in a perpetual state of blockade, and continually getting worse and worse,—is so very obvious, that the subject is ever and anon forcing itself into reiterated notice, as indeed it ought to do, and must do, till the intolerable and still increasing grievance shall be fairly met and obviated: and the sooner the better, considering not only the really alarming increase of the general traffic in the streets of the metropolis, but the rapid extension of these streets themselves, presenting thus an ever increasing obstacle to the carrying out of any feasible scheme of railway interconnection, except at a wide sweep around its suburban districts, which would still further postpone the requisite internal interweavement of routes. A Tract, by Mr. William Footman, titled "A Practical Means of providing an efficient Accommodation for the Traffic of the Metropolis," has just been published by Herbert, 88, Cheapside, in which a railway scheme is proposed to be carried out by a company, at a cost of 3,600,000*l.* including the purchase of Southwark-bridge, for the purpose of the projected railway, which is to run as an extension, from the South-Western and South-Eastern, to that bridge, so as to form a junction with a Blackwall extension, and to pass over Thames-street and Cannon-street, and by a tunnel under Cheapside and St. Martin's-le-Grand, &c. to Smithfield, and then, by open railway again, to the Great Northern, at King's-cross; passing thence on by the outskirts of the Regent's-park, and forming a junction with the North-Western by the way, to the Great Western at Paddington. The total length of the proposed company's line would be about 6½ miles, and it is noted that short lines in populous districts are the best paying lines; and certainly no such populous districts as these are to be found so concentrated throughout the whole world. Without *some* system of central interlinkment (if we may be allowed the expression), our railway system is like a body without a head,—like some of those acephalic fœtal monsters which occasionally astonish the world. The organization of the railway system of England cannot be regarded as a vital self-sufficient organism till a *centrum commune* or central head be formed in the metropolis; and we hope to see this done ere many years go over our own head.

THE BANK OF LONDON, LATE HALL OF COMMERCE.—Mr. McLean has lately published a good view of the beautiful chamber, in Threadneedle-street, formerly known as the Hall of Commerce, and now occupied by the Bank of London. It was judiciously fitted up for this purpose by Mr. Edmund Woodthorpe.

LORD SOUTHESK AND AGRICULTURAL DWELLINGS.—We learn with much satisfaction that the Earl of Southesk has given instructions to the tenants on his estates to make returns of all the houses and cottages occupied by servants and others employed in agricultural labour, specifying the dimensions of the different departments, and other particulars, with the view of introducing a thorough reform in the dwellings of the humbler classes in this quarter (Brechin). We also learn that his lordship is about to erect a comfortable dwelling-house and place of meeting for Mr. Wodsworth, home missionary, whose labours among the out field population of this town have been attended with marked success during the few months that have elapsed since he became a denizen of the ancient city.

PRESERVING WOOD, METALS, &c.—MONS. C. F. L. Oudry, of Paris, has patented the application of copper or other metals on iron, zinc, and other metals and their alloys, and also upon wood, paper, cardboard, and stone, having first covered them with an isolated coating of a composition susceptible also of preserving, waterproofing, and metallizing them, and which coating is a conductor of electricity. The copper is applied to any desired thickness by ordinary electro-chemical means, and serves to preserve the metal or other substances thus covered from oxidation by the action of the air, water, or the humidity of the earth. The composition may be made of metal or metallic salts, combined with essential oils or greases, and resins, gums, bitumen, or asphalte, according to the nature of the articles to be covered over, and a conducting property is given by adding copper, graphite, or other metallic powder.

THE SEWAGE OF GREAT TOWNS.—Mr. R. G. Whitfield writes to the *Times*:—"About eight years ago the city of Antwerp paid annually for sweeping their streets 20,000*f*. The scavenger not being satisfied, and having made an increased demand, the members of the corporation came to the determination to put the cleansing of the streets up to competition. The first year they obtained 15,000*f*. which, as the sewers, formerly all communicating with the Scheldt, have been removed and cesspools made, has gradually increased up to the present time, when the corporation receives 120,000*f*. the contractor paying that sum for the privilege of obtaining the sweepings of the streets and the contents of the cesspools! The streets of Antwerp are now swept every morning throughout the year before ten o'clock. The dust and refuse from the houses are not allowed to be thrown into them (as is done in Paris) until the scavengers' bell rings, and the cesspools containing the excrement are periodically emptied, by order of the municipality, the soil being first deodorised, and the whole, with the dust and sweepings, are carted away some miles into the country, and converted into guano, a very thin layer of earth on the deodorised soil being sufficient to keep down any noxious exhalations. The fertilising qualities of the street-sweepings and the night-soil, when converted into guano, are truly surprising, both at Antwerp and Paris, and are, commercially, a very lucrative speculation. In Paris, last year, I watched the growth of grass-seed sown upon earth prepared with the 'town guano,' for a lawn at the Duchess D'Aiba's: on the eighth day it was mown! At Milan, where the system has been extensively adopted, and the town-produce for years has been converted to its legitimate use, the land yields eight crops of grass a year!"

VENTILATION.—PURE AIR.

Sheringham's Ventilator for the admission of pure air through an

EXTERNAL WALL.

With single pulley, from 6*s*. each; with leading pulley, from 8*s*. 6*d*. These Ventilators are arranged that the requisite quantity of air may be admitted for the due ventilation of an apartment without the slightest draught being felt by the occupants; and as they are placed in the external wall, their action is not impeded when the house is closed for the evening, at which time a constant supply of fresh air is most required. HAYWARD, BROTHERS, sole Manufacturers, 196, Blackfriars-road, and 117, Union street, Borough; and of all respectable ironmongers, builders, &c

WILLIAM W. BUNNIN, Secretary.

MARBLE CHIMNEY-PIECES.—The nobility and gentry of the United Kingdom who are building or rebuilding their mansions are respectfully invited to inspect the most Extensive Collection of MARBLE CHIMNEY-PIECES lately imported from the Continent. They comprise Statuary, Giallo di Sienna, Vert Rouge, Dove, Black and Gold, Rouge de Belmont, Bardiglio, and other choice foreign marbles; and are designed with great taste, and executed by first class artists. On view, in the show rooms of Messrs. EVANS, SON, and CO. King William-street, London-bridge.

TO SCULPTORS, STATUARIES, MARBLE MASONS, and OTHERS.—A good opportunity is offered to enter upon an old established business, the proprietor wishes to retire, and will give every information. The business has been carried on successfully for forty-four years. Apply to Mr. FLOWS, Pimlico, Lane, Lane.

N.B. A large number of Marble Chimney pieces, Tablets, other Work, and Stock, offered for sale considerably below trade prices. Also, either together or separately, a Stone Wharf, Stock, Shops, and Premises.

RANSOME'S SILICIOUS STONE.—All kinds of ARCHITECTURAL EMBELLISHMENTS executed in this beautiful and indestructible material, at prices not exceeding the ordinary cements. Full particulars furnished on application to Mr. FRED. RANSOME, Whitehall-wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich.

BATH STONE.—HENRY STONE, having understood that some parties have been offering for sale a sort of stone, calling it Hampton Down, H. S. begs to inform Architects, Builders, and others, that he is the only person that can supply that article. Having, about two years since (at a considerable expense) reopened the well-known Hampton Down Quarries he is happy to state that he can now supply that stone to any extent. Since opening the quarry, H. S. has supplied a considerable quantity of it to several churches and other public buildings. COMBE DOWN and BOX GROUND WEATHER STONE on the most reasonable terms. Residence, WIDCOMBE, BATH. Cargoes shipped and delivered to any part round the coast.

BATH STONE DEPOT, BOX STATION.—ROBERT STRONG, STONE MERCHANT, Box, Wilts.—Box Ground Stone, Scalletts' Block, Ashlar, Rancework, &c. &c. Supplied direct from the Quarries; also every description of Stonework for building purposes, both plain and ornamental, prepared ready for fixing, and forwarded to any part of the Kingdom. Vases in elegant variety always on view; Urns, Fountains, Chimney-pieces, Tombs, &c. &c

A Capital Travelling Crane for Sale.

TO CONTRACTORS AND OTHERS.

YORKSHIRE PAVINGS, LANDINGS, STEPS, COPINGS, CURBS, SILLS, SINKS, and CHANNELS; Horse-hill, Robin Hood, Park Spring, and Gaphy, in Blocks, Headstones, or Slabs; Purbeck Paving, Sinks, Curbs, Ricketones, Pitchers, and Squares; Caithness Flags, Firestone, Newcastle and Bilston Grindstones; Portland Stone in Blocks, Landings, Slabs, &c.; Darley Dale, Caen Stone, Bramley Fall, Bath, Huddlestone, Park-wood, and other Block Stones. Valentia Slate Slabs, Bangor Slate, Arundel, Guernsey, Welsh, and other Granites; Marble, in Block and Slabs, supplied from the Wharfs, Millbank-street, City Basin, and Deptford; also direct from the quarries by vessel or rail.—Address, FREEMANS WHARF, 27, Millbank street, Westminster.

YORKSHIRE STONE.—THOMAS TILNEY, Stone Merchant, Tanfield-place, Leeds, begs to inform Builders, Surveyors, and Local Boards, that he can supply direct from his Quarries, by water or railway, Paving, Landings, Steps, &c. got out to sizes, on the most advantageous terms.—Prices sent on application.

WELSH GRANITE.—The Welsh Granite Company, Carnarvon, supplies Pitching or Paving Sets of this Material to order. The Sets, which have for several years been extensively used in Manchester, Bristol, Leeds, and other large towns, combine in a higher decree than any others, the qualities of roughness in wear and durability. The stone is also well adapted for foundation courses, plinths, &c. for public buildings and for mill-stones.

GRANITE.—King William and Nelson Monuments, Plinth and Steps of the Royal Exchange, and Terraces at the Crystal Palace.—Supplied by the Haytor Company under Royal Charter.—For terms, apply to Mr. C. HOAR, Haytor Granite Office, 4, Millbank-row, Westminster.

GRANITE.—The Cheesewring Granite Company, Liskeard, Cornwall.
London Agents—TREGELLES and TAYLOR, 54, Old Broad-street. Manager—JAS. J. TRATHAN, Liskeard
This Granite is selected for the New Westminster-bridge.

BRAMLEY FALL! BRAMLEY FALL! On account of greater facilities than possessed by any one else, TRICKETT and PERKINS are prepared to supply in any quantity BRAMLEY FALL STONE, at greatly reduced prices, having opened the extensive quarries in the Hazelwith Cutting, on the North-Eastern Railway, near Horsforth. The stone is of the same quality as the well-known Old Bramley Fall and Horsforth Quarries, but has the advantage of being of a lighter and more uniform colour. The North-Eastern Railway Company have put skids in on both sides of the cutting. Powerful cranes are fixed, so that the stone can be got to any size. The stone being loaded in the quarries on the railway-tracks, can be forwarded the same day to any part of the kingdom, or supplied in London river via Selby or Hull, in any quantity.—For particulars apply to JOHN TRICKETT Stone Merchant, Headingley, near Leeds, or to SAMUEL TRICKETT, Victoria Stone Wharf, Isle of Dogs, London.

BANGOR WHARF, King's-road-bridge, Camden-town.—STRINGFIELD and COOPER, late W. W. Rawlins, beg to call the attention of Builders and others to their stock of Bangor slates, laths, plaster, Roman, Portland, and Keene's cement, blue lias, Dorking and chalk lime, plasterers' hair, Yorkshire plain, pan, and rider tiles, glazed sewer pipes, closet-pans, and traps, Welsh fire-bricks, gravel and shells for garden paths, ballast, sand, &c. Materials landed, wharfed, and carted.

QUARRY WORKED STONE.—Architects, Masons, and Builders would effect a great SAVING in cost by ordering bases, plinths, tremulate, cills, corbels, imposts, cornices, copings, steps, staircases of all kinds, moulded or plain, square or spandril, from the quarries ready worked for fixing. Experienced foremen are kept, and the stone is clean worked, and carefully packed or stowed, and delivered direct in one bottom by vessel or railway truck.—Prices and every information given on application, accompanied by plans or sketches, to SAMUEL TRICKETT, Stone-wharf, Isle of Dogs, or to JOHN TRICKETT, Headingley, Leeds, Yorkshire.

GREEN MOOR STONE WHARF.—BROWN and BOOTH, 42, Bankside, Southwark, beg to invite Builders, Architects, Masons, and the Trade, to the stock of STONE of all kinds; viz. Portland, Guxeby, Harehill York Paving, Landings, &c. &c.; the Green Moor stone in blocks, landings, quarry-worked steps, sinks, coping, &c. &c. Sawn slab and headstones in Green Moor, Harehill, Robin Hood. The best attention given to all orders, and price-lists sent on application—at such prices to meet the wishes of all. The nearest wharf to the City and Surrey side of the water.

CAEN and AUBIGNY STONE.—F. FOUCARD, Stone Merchant and Quarryman. Cargoes shipped to order from Caen to any port. Contracts taken for any quantities. Depôts: Granite Wharf, East Greenwich; Lett's Wharf, Waterloo-bridge. Office: 946, High-street, Southwark, near the Townhall.

GATES and GEORGE, CAEN, AUBIGNY, and GENERAL STONE MERCHANTS,
CAEN WHARF, ROTHERHITHE, LONDON.

MARKET-WHARF, REGENT'S-PARK-BASIN.—WEST-END DEPOT for Yorkshire Paving, Portland and Derby Stone, Ranger Slates, Slabs, &c. Also Bricks, Lime, Cement, Plaster, Tiles, Laths, and Fire Goods SCOLES and WOOD invite the attention of Builders, Masons, and others, to their Stock as above, where everything will be charged at the lowest prices. Headstones, Ledgers, Steps, Landings, &c. cut on the shortest notice. Country orders promptly attended to

STONE! STONE! STONE!—To the TRADE.—The cheapest place in London for Portland and Bath Stone, Yorkshire Landings, Steps, Curb, Paving, Self-face Slab, Granite Pitching and Curb, Guernsey broken Road Materials, and every other description of stone, at JOHN KNIGHT and SON'S, Devon Wharf, Mile-end. York tooled paving, 38s. 6d. per 100 feet; slab for hss. 4d. per foot sup; slab for chimney-pieces, 9d. per foot sup.; 8 by 3 window-sills, 6d. per foot run; 13 by 3 coping, 8d. per foot run; box chimneys (any opening), 8s. 6d. each. Terms cash on delivery.

JOHN BAZLEY WHITE and BROTHERS, MARBLE MERCHANTS,
MILLBANK-STREET, WESTMINSTER.
Marble of all kinds and of best quality, in block and slab. Marble mortars, &c.

BATH STONE OF BEST QUALITY.

RANDELL and SAUNDERS, QUARRYMEN AND STONE-MERCHANTS,
BATH.

List of prices at the quarries and depots, also cost for transit to any part of the kingdom, furnished on application to Bath Stone Office, Corsham, Wilts

SCAGLIOLA on an IMPROVED PRINCIPLE.—Reference is made to the Gothic Arch by D. DOLAN, in the Great Exhibition of 1851 (see p. 575 of the Reports), whereon the jury thought it just to AWARD him the ONLY PRIZE MEDAL in that Department of the Art.—Specimens may be seen at 193, Drury-lane, two doors from Holborn; or at Messrs. STEVENS and SON'S, Plaster of Paris Works; and MARTIN'S Cement Warehouse, 186, Drury-lane; as also a choice Collection of Ornaments for building purposes, royal coats of arms, &c. &c

CHIMNEY-PIECES, Baths, Tombstones, Pedestals, Washing-tables, Urinals, and every other Article of Slabwork, PLAIN or ENAMELLED
Self-faced Flags for Barns, Outhouses, or Street Paving.
In Stock at Paddington, SEVERAL FINE SLABS of 70 SUPERFICIAL FEET each.
LLANGOLLEN FLAG AND SLATE COMPANY,
PENTREFELIN WHARF LLANGOLLEN
AND 4 WHARF, SOUTH WHARF-ROAD, PADDINGTON.

ROOFING SLATES, SLATE CISTERNS, And every description of Slate Slabwork. T. B. HANNAFORD begs to inform Builders and the Public generally that they not only can rely on the best of materials and workmanship, but being part owner of an extensive quarry, he is enabled to offer his slates at prices considerably lower than the usual quotations.—Treviske Wharf, Ratcliff-cross.

VALENTIA SLATE SLABS.—The Valentia Slab Company invite attention to their Slabs now supplied, of very large dimensions and of superior quality They have been used at the British Museum, National Gallery, Bethlem Hospital, various Lunatic Asylums, the Ordnance Works Model Prison, Pentonville, and other Penitentiaries; Malting Floors in Bedfordshire and Hertfordshire, Breweries, the Race Stand at Brighton, Portsmouth Barracks, and are kept in stock in large quantities by Messrs. FREEMAN, Millbank-street; and at Messrs. Peake's, Belsize-road, where terms may be obtained

PARIS EXHIBITION.—ENAMELLED SLATE—TWO FIRST-CLASS MEDALS.—Mr. MAGNUS is the only exhibitor whose productions received this double honour; also the Prize Medal at the Great Exhibition of 1851, and the Medal of the Society of Arts in 1845. This beautiful material handsomer and more durable than marble, is now finding its way into palaces, into the mansions of the nobility at home and abroad, into the highest class of public buildings, as well as into humbler dwellings. The cost is immeasurably below that of any other production that can at all compete with it. It is applicable to a variety of useful and ornamental articles—too numerous to be separately specified. Among the chief are chimney-pieces and ornamental stoves for all apartments; plain and exquisitely decorated slabs for the tops of lee-tables, chiffoniers, consoles, &c.; baths baptistries, altar-tablets, pilasters, columns, vases pedestals, and brackets; wash-stand tops, billiard tables, linings to halls, vestibules, and dairies.—Price list can be had on application to Mr. MAGNUS, 39 and 40, Upper Belgrave-place, Pimlico.
N.B. Plain slate work executed from a single article to the most extensive contracts, for home and abroad

SLATE.—The Bangor Royal Slate Company have now on hand a LARGE ASSORTMENT of ROOFING SLATES, blue and green, of the usual sizes, which they are prepared to supply on the usual terms, for shipment from their depôt, at Bangor, or to transmit by railway. Also Slabs of all sizes.—Apply to the Secretary, addressed to Mr. EDWARDS, Manager, Royal Slate Quarries, Bangor.

WATER-SIDE PREMISES. — TO BE LET, or the LEASE TO BE SOLD, a WHARF, on the Regent's Canal, near the Victoria-dock, having a frontage of about 140 feet, with large shed, carcase of dwelling-house, and large stabling.—Apply to Mr. ST. QUINTIN, Auct oneer and Surveyor, 30, Royal Exchange.

WINDOW-BLINDS.—J. FULLER, Manufacturer, 29, Charlotte-street, Blackfriars-road, Established, 1830.—Venetian Blinds, from 10s. each, or 8d. per foot; Wire ditto, 7s. each, or 1s. 9d. per foot; Holland ditto, from 5s. each, or 6d. per foot. Every other description of Blinds equally low, warranted of the best manufacture. Discount to Builders and the Trade. Fixed complete.

WINDOW BLINDS.—TYLOR & PACE, Window Blind Manufacturers, 104, New Bond-street, and 3, Queen-street, Cheapside, London, submit the following PRICES of WINDOW BLINDS, which they can recommend as being made in the best manner:—Venetian blinds, per square foot, 8d.; best holland blinds, on rollers, 6d.; best ditto, on spring rollers, 9d.; gauze wire blinds, in mahogany frames, 2s.; perforated zinc blinds, in ditto, 1s. 10d.; outside blinds of striped cloth, 1s. Transparent blinds in great variety. Engravings, with prices and discounts to builders and the trade, forwarded on application post free.

THE PORTLAND CEMENT WORKS, NORTHFLEET, KENT.—Messrs ROBINS and Co. to WHOM THE PRIZE MEDAL WAS AWARDED in 1851, are prepared to supply any quantity of the very best PORTLAND CEMENT, manufactured by them for all the purposes to which Cement is applicable. Orders received at Great Scotland-yard and at the Works.

PORTLAND CEMENT WORKS, NORTHFLEET, Kent.—KNIGHT, BEVAN, and STURGE, Manufacturers only of first-class quality, for the home and foreign trade. Portland Cement is manufactured at these works with especial reference to its destination, whether for stuccoing, brickwork, blocks for breakwaters, tidal work, or otherwise.—London Wharf, Belvedere-road, Lambeth.

PORTLAND and ROMAN CEMENTS.—T. H. BOORMAN, WILD, and CO. MEDWAY LIME and CEMENT WORKS, LOWER HALLING, near Rochester. Agent at the Works—Mr THOMAS WEEKES.
Agents in London, Messrs. GEORGE POTTER and CO., Limemerchants, Purfleet-wharf, Earl-street, Blackfriars, and No. 19, North-wharf-road, Paddington.

PORTLAND and BATH CEMENTS.
TATHAM and CO.
14, South Wharf, Paddington.

PORTLAND and BATH CEMENT.—FULLWOOD THOMPSON and CO. request the attention of Merchants and Contractors to the quality of their Portland and Bath Cement, which they manufacture on an improved system, securing regularity of strength and colour, and at a less cost than is attainable by most other makers.
These cements set under water in a few minutes, and are not affected by extreme heat or cold.
FULLWOOD THOMPSON and CO. will be happy to send prices and samples in reply to application to post. They deliver free into the Bristol and Exeter Railway Company's trucks at their works, or free on board in the Port of Bridgewater.

GEO. & THOS. EARLE, CEMENT MANUFACTURERS, HULL.—Light, Dark, and Portland Cements equal to any made. Manufacturers also, and Dealers in Plaster, Pan's White, Mastic, Hair, Lias Lime, Laths, Slates, and Slate Slabs, Fire-bricks, Grindstones, Cement Chimney-tops, ditto Vases, Ridging, &c. Paints, Stucco, &c. Marble Merchants and Importers of Pozzolano

11, George-yard, Lombard-street, City.

ELMLEY CEMENT WORKS.—ROMAN and PORTLAND CEMENT of the first quality, manufactured on the above works. Also STOCK and KILN-BURNT BRICKS, hand moulded and machine made, for shipment or otherwise.—Apply to G. BOOTH, Agent, as above.

KEENE'S and PARIAN CEMENTS and FRENCH PLASTER, for internal uses. These well-known hard Stuccos dry quickly, and can be painted upon within a few days. Made and sold by JOHN BAZLEY WHITE and BROTHERS, Millbank-street Westminster

ATKINSON'S CEMENT, so long known and esteemed in London for plastering purposes, is a quick-setting Cement that requires no colouring. Sold exclusively by JOHN BAZLEY WHITE and BROTHERS, Millbank-street, Westminster: and Seel-street, Liverpool.

ARTIFICIAL HYDRAULIC or PORTLAND CEMENT combines the valuable qualities of the natural Cements with the additional advantage that it greatly excels them in its cementitious properties; that it is not affected by frost, and does not vegetate in damp situations. Account of COMPARATIVE EXPERIMENTS or the strength of this and other Cements tried at the Institute of Civil Engineers, to be obtained from the Makers, JOHN BAZLEY WHITE, and BROTHERS, Millbank-street, Westminster, who prepare one quality only of Portland Cement.

BATH, PORTLAND, and ROMAN CEMENTS.—The London and West of England Cement Company can offer to the Trade the best natural HYDRAULIC CEMENTS at reduced prices. The Company particularly recommend the best quality of Roman Cements for all modelling cornices, decorations, &c. as having all the qualities requisite for an interior cement, and being quite unaffected by extremes of weather. The Company also supply BLUE LIAS LIME lump and ground, which will carry more sand than any in the market. Communications to be addressed to the General Offices, 80, Old Broad-street, London, or to Mr. MONTAGUE, at the same place, City-road; to Mr. TIMEWELL, the Depôt, 8, North Wharf-road, Paddington; or to the Works, Dunball, Bridgewater.

SOUTHAM BLUE LIAS LIME DEPOT.
Glazed Stoneware Sewage Pipes.
Brick, Lime, and Cement Merchants,
TATHAM and CO.
14, South Wharf, Paddington.

PARIAN CEMENT, reduced in price 25 per cent. This article is valuable for inside stucco, and especially for skirtings, for flooring on brick arches, &c. It takes paint in a few hours after its application on walls or casts, of an hour's walk from the Town, and is ready for use in a couple of days. A finer quality forms a beautiful Scagliola, with any admixture of colours.—Manufactured by FRANCIS, BROTHERS, Cement Works, Nine-elms, London.

CEMENT.—ROMAN and PORTLAND CEMENTS, and PLASTER of PARIS, manufactured by C. J. HILTON, can be had in any quantity, wholesale and retail, at his wharf, 6, Thames street, London, and also at the manufactory, Faversham, Kent.—N.B. These Cements supplied for shipment, on advantageous terms

JOHNS and CO.'s PATENT PERMANENT STUCCO WASH (perfectly non-absorbent), STUCCO, CEMENT, STUCCO PAINT.—CLARK and BENGOUGH, Manufacturers, Grand Surrey Canal Bridge, Old Kent-road. Office, 4, George-yard, Lombard-street.

PORTLAND CEMENT.—JAMES WESTON having enlarged that portion of his CEMENT WORKS on Millwall, Poplar, for Manufacturing the above CEMENT, begs to inform the Trade in general that they can be supplied with any quantity they may require, either at his Works, St. Andrew's Wharf, Earl-street, Blackfriars, or Middle Wharf, Scotland yard, Westminster. Manufacturer of Roman, Lias, and Mastic Cements, English and French Plaster, &c.

PORTLAND and ROMAN CEMENT, PLASTER of PARIS
Manufactured by J. M. BLASHFIELD, at Millwall, Isle of Dogs.
Warehouse, No. 1, Wharf, Paddington-basin.

BLUE LIAS LIME.—CHAS. NELSON begs to offer to consumers a supply of Blue Lias Lime direct from his quarries in Warwickshire, the quality of which has been tested by several of the largest building firms in the metropolis and approved by them; and those who have favoured C. N. with their patronage during the last three years have always expressed themselves satisfied with his system of weighing or measuring the lime. When the lime is delivered by boat, the master has instructions to produce (on demand) the canal scaurer's pass, by which the purchaser may know the exact weight delivered.—Orders addressed to the London Depôt, 18, South Wharf, Paddington, J. D. BLYTH, Sole Agent, will have immediate attention.—Quarries and Manufactories, Stockton, near Southam, Warwickshire.

DAMP WALLS.
STENT'S COMPOSITION FOR PREPARING NEWLY-PLASTERED OR DAMP WALLS FOR PAPERING,
Is the result of practical experiments and long experience; it is unfailing in its application. Entire houses have been papered a few days after plastering. In repairs of old plastering it is invaluable. A moderate room can be papered for 2s. 6d.
Prepared only by W. J. STENT, Warminster.
London Agents: Messrs. GEO. and THOS. WALLIS, 64, Long-acre. Agent for Ireland: Mr. S. BOYD, 46, Mary-street, Dublin.

HUBBUCK'S WHITE BODY PAINT of superior body to the Best White Lead, whilst it is as smooth and permanent as Zinc Paint. One coat laid on as directed is equal to two coats of White Lead; whilst the consumption of material is less than for one coat. It dries very fast and hard.
HUBBUCK'S STONE COLOUR BODY PAINT the same as the former, at three fourths the price.
HUBBUCK'S PATENT WHITE ZINC PAINT is invaluable for Iron Ships and iron exposed to salt water; neither bilge water, nor noxious vapours from cargo, nor heat on funnels of Steam Vessels act upon it. Sold by the Wholesale Paint Dealers, in original packages stamped Hubbuck's Patent, and all are so marked the quality is guaranteed
HUBBUCK'S COPPER COLOURED ENAMEL PAINT prepared expressly for the bottoms of Iron and Wood Steam Ships, a protection from rust and incrustation. Timber coated with this Enamel is not attacked by the worm, neither do barnacles attach to it.
Full particulars of THOMAS HUBBUCK and SON, Patentees and Varnish Works, opposite the London Docks, London.
OLD ZINC AND ZINC CUTTINGS BOUGHT TO ANY EXTENT.

CHARLES RICHARDSON, 3 & 6, SOUTH-WHARF, PADDINGTON BASIN.
COWLEY AND KENT BRICKS,
PORTLAND, ROMAN, AND OTHER CEMENTS,
TAMWORTH GLAZED SEWAGE PIPES,
BLUE VITRIFIED BRICKS, COPINGS, PIPES, &c.

3 & 6 South Wharf, Paddington.

NOTICE.
CHARLES RICHARDSON takes the earliest opportunity of informing Engineers, Architects, Contractors, and others, that he is now SELLING GREAVES'S BLUE LIAS LIME per the Great Western Railway from Harbury to Bull's bridge and Paddington, from whence it can be delivered a month any part of the river Thames, canals, or railway stations in London the day after it is burnt and ground, in any quantity, and at a great reduction in price.
All applications for prices and terms will meet with prompt attention.
N.B. Please observe the lime is ground at the works, not in London.

GREY STONE LIME WHARFS, 12, UPPER GROUND-STREET, Blackfriars (Surrey side), 7, NORTH WHARF-ROAD, Paddington.
WILLIAM PETERS begs to inform the trade he is in a position to supply the best GREY STONE LIME at any quantities from the above wharfs, or per barge direct from the kilns.
Large Grey Stone, or Grey Chalk, free on board at Works, 9d. per ton.
Small ditto, ditto, 6d. per ton.
Barges loaded in a few minutes.
Wouldham-hall Grey Stone Lime Works, on the Medway, near Rochester.

NOTICE.
SOUTHAM HYDRAULIC BLUE LIAS LIME.
WILLIAM OLDHAM begs to inform those parties requiring genuine Hydraulic Blue Lias Lime, that he is prepared to deliver the best quality of ground and lump, into boats, at the Works.—Address, WILLIAM OLDHAM, Blue Lias Lime and Cement Works, Southam.

BLUE LIAS LIME.—Messrs. GREAVES and KIRSHAW having completed their Works on the Birmingham and Oxford Line of the Great Western Railway, at Harbury, are now prepared to supply LUMP and GROUND LIME of the best quality, direct from the kilns, to all the stations on the Great Western Railway. Greaves's Blue Lias Lime.—Portland, Batl., and Lias Cement. Works, at Harbury, Stockton, and Wilmcote. Office, at Warwick

PLASTER of PARIS manufactured by T. P. BLYTH, Baldwin's-place, Gray's-inn-lane, Holborn. The trade and shippers supplied on advantageous terms. Roman and Keen's Cement, Tiles, Plasterers' Hair, Pan and Plain Tiles, Fire Goods, &c

BRICKS of all kinds (clamp-burnt or kiln-burnt), Lime, Chalk, Chalk Rubbish for brick-making, Flints for building, Gantry sand, Coarse loam, Whiting, White Sand for asphaltic, Land Drain Pipes, Patent Drain Pipes, Gas Soil for brick-making, &c. &c. sent by barge from Messrs. MELSON and CO.'s wharf at Grays, Essex, to any part of the Thames, the various canals, the river Lea, &c. or by rail to any station on the London and Southend and Eastern Counties lines.—Railway Consignees (with them only) to be so named in the goods' delivery orders at Grays. At MELSON and CO.'S wharf and kilns, Bow-bridge, Stratford, Essex, the above-named articles can also be procured, as well as all kinds of fire goods (in Welsh and Newcastle). Fire-clay, Flare-burnt Lime, and Marble and Temper Lime; and here lime is packed in hogsheads, casks, jars, &c. for exportation

BRICKS.—Malm Cutters, Yellow and Pale Seconds, Pariors, and Pickings, of good and sound quality, constantly on sale at K. DODD'S Brickfields, which are only a quarter of an hour's walk from the Curtain. H. D earnestly requests purchasers to favour him with a visit, in order to inspect his stock and to judge for themselves.
Malm Place, half-washed Stocks, and Place Bricks, also on sale. These bricks are sound, well burnt, and unusually free from defects; a very large proportion of the stock being suitable for external facing.
Apply to HENRY DODD and CO. at the Counting-house, Hoxton Brickfields, Grange-walk, near the Rosemary Branch, Hoxton.
N.B. Lighters can load Sand of a coarse quality constantly on sale upon reasonable terms. This Sand, from its not containing any saline matter, is acknowledged to be preferable to river sand.

THE BEST HERTFORDSHIRE MALM SECONDS;
THE BEST WHITE SUFFOLK and RED FACINGS:
WHITE SUFFOLK PERFORATED BRICKS;
DEEP-RED RUBBING BRICKS.
Also COWLEY and KENT STOCKS, in any quantities.
J. EASTWOOD and SONS, Belvidere-road, Lambeth; and Surrey-canal-bridge, Old Kent-road, Surrey.

BRICK-FIELDS, QUEEN'S-ROAD, PECKHAM, SURREY
(Within a short distance of the five bridges).
THE BEST MALM CUTTERS, SECONDS, PALINGS, and PAVIORS, in any quantity.
Also, STOCKS, of FIRST QUALITY.
J. EASTWOOD and SONS, Belvidere-road, Lambeth.

BRICKS.—Mr. Rydon having made more bricks than he requires for the builders on his estate, Highbury New-park, would be willing to enter into arrangements with builders and others for supplying first-class STOCK and RED BRICKS upon advantageous terms.—For particulars, apply at the Estate Office, Dell's Farm, Stoke Newington Green.

THE PATENT BRICK MACHINE COMPANY invite orders for their IMPROVED MACHINES. One of them is working in a field at Caterham, near Croydon, and arrangements are made with the owner for bearers of a letter from the Secretary, to see it in operation every Thursday and Friday. It is the most simple machine invented. Trains from London-bridge to Warlingham (close to the field), leave at 6 and 9.30 a.m. and 3 p.m.; return at 9.55 a.m. and 5.5 and 7.35 p.m.
HENRY C. JOUNG, Sec.
37, King William-street, City.

ROUPELL-PARK BRICKFIELDS, LOWER NORWOOD, SURREY. Entrance, Norwood, Palace-road.—BRICKS of the first class. Red Kiln Bricks Cutters, Dressings, Facings, and Paviors, Clamped ditto, Yellow and Pale, Seconds, Pariors, and Pickings, Wasted Stocks, Stocks, and Place. Apply to TRUMAN and CO. Norwood Lodge, Palace-road, Roupell park, Lower Norwood, Surrey.

11, George-yard, Lombard-street, City.
ON SALE, 3,000,000 PLACE BRICKS, of good quality, for cash or approved bills. Immediate delivery. Apply to G. BOOTH, Agent, as above

BEADON'S EAVES GUTTER TILES.—Mr. LAWES is prepared to CONTRACT for the ERECTION of the above TILES on roofs of all descriptions, in the neighbourhood of London, at 7d. per foot; above 100 feet, 6d.—Office, 1, Adelaide-place, London-bridge.

BEADON'S PATENT IMPERISHABLE GUTTER TILES.
For Spouting Roofs of Houses (either old or new, whether of thatch, slate, or tile), and other structures.
SOLE AGENT,
J. B. LAWES, 1, Adelaide-place, London-bridge.
This is the cheapest and most durable spouting known; for, besides its lower cost, it will last without paint or repair as long as the building itself. It will bear the weight of any ladder; and in case of accident a labourer can repair it. It occupies the room of a large amount of roofing, effecting a great saving in slates, tiles, &c. It is especially applicable to the backs of houses in town, cottages, and agricultural buildings.
Price 4d. each tile of about 13 inches long; stop-ends and outlets, 8d. Any mason can put them up, or if over 100 feet are required, a man will be sent to fix them at 5d. per foot. This charge to include tiles delivered in Agents yard, cement, and labour. May be had in London, Gloster, Bridgewater, and Rugby.

PEAKE'S TERRO-METALLIC TILES, PIPES, &c.—Notice is hereby most respectfully given, that the LONDON DEPÔT for this WARE is REMOVED to No. 21, WHARF, Macclesfield-street North, City-road Basin. Secondly, that the trade term, "Terro-Metallic," is the exclusive right of the Proprietor, and, thirdly, that the "Reports of the Jurors," page 581 of the Great Exhibition, rank the Manufactories known so long as "The Tileries," Tunstall, Staffordshire, as the first of the kind in the world.

PANTILES, PAVINGS, &c.—J. H. ANDREWS, Wisbeach, Cambridgeshire, begs to offer pantiles at 30s. per 1,000; floor bricks and 6-inch pavings, at 37s. 6d. per 1,000; 8-inch pavings, at 37s. 6d. per 1,000; plain tiles, at 28s. per 1,000, delivered. Cash prices. Delivered on trucks in London on Eastern Counties Railway.

H. and R. HAYWOOD, Brownhills Blue Metallic Tileries, near Burslem, Staffordshire; London Depôt, 78, Southwark-street, Tooley-street. Manufacturers of Improved plain and ornament. Roofing, Ridge and Flooring Tiles, for Churches, &c.; also Metallic Plain and Socket Newsewage Pipes, &c. adapted for sanitary purposes. They are extensively used on the London and North Western, Great Western, Trent Valley, North Staffordshire, and other Lines of Rail, and highly approved. Warranted superior, and to resist all acids and exhalations.
*** A FIRST-CLASS MEDAL was awarded to H. and R. HAYWOOD, by the Jury of the GREAT EXHIBITION.

WILLIAM GILBERT, Manufacturer of all kinds and colours of Tiles, Quarries, Drain-pipes, Moulded Bricks, Brackets, Vases, Chimney-pots, Stoneware Glazed Sewerage Pipes, Ornamental Queen Blocks, &c.
Tividale, Staffordshire.

MACINTOSH INDIA-RUBBER WAGGON COVERS, at reduced prices. Stocks of different sizes are always ready, and can be inspected at our Warehouse, MESSRS. SON, and DAVIS, 2 and 15, Aldgate High-street, and at the Factory, India-Rubber Steam Works, Bow-common.

DURABILITY of GUTTA PERCHA TUBING.—Many inquiries having been made as to the Durability of Gutta Percha Tubing, the Gutta Percha Company have pleasure in giving publicity to the following letter.—FROM SIR RAYMOND ARVIS, Bart., YENTNOR, ISLE of WIGHT.—Second Testimonial.—"March 10th, 1852.—In reply to your letter, received this morning, respecting the Gutta Percha Tubing for Pump Service, I can state, with much satisfaction, it answers perfectly. Many Builders, and other persons, have lately examined it, and there is not the least apparent difference since the first laying down, now several years, and I am informed that it is to be adopted generally in the houses that are being erected here."
N.B. From this Testimonial it will be seen that the CORROSIVE WATERS of the ISLE of WIGHT has no effect on Gutta Percha Tubing.
THE GUTTA PERCHA COMPANY, PATENTEES,
18, WHARF-ROAD, CITY-ROAD, LONDON.

HANCOCK'S PATENT VULCANIZED INDIA-RUBBER TUBING, HOSE-PIPES, WASHERS, ENGINE-PACKING, both round and flat, and SOCKET-RINGS, for Hot-water-pipes. Vulcanized Rubber Door-springs, and Solid Round Rubber Cord of all sizes of any length. Billiard Cushions and Rubber strip cut to any pattern for macatelle tables
Diving-dresses of superior make, and improved Vulcanized Rubber Supply-pipes for ditto.
Vulcanized Rubber, in sheets, from three to four feet wide, and of any thickness. Air-beds, Pillows, and Cushions inflating Portable Baths, Invalid Cushions, and Articles of this kind made to any pattern to order.
N.B. All communications and orders punctually attended to, addressed to the Manufactory, JAMES LYNE HANCOCK, Goswell-mews, Goswell-road, London.

FACING FOR BUILDINGS COMPANY—TAYLOR'S PATENT.

BUILDINGS PERFECTLY RESISTANT TO WET WITHOUT ADDITIONAL EXPENSE, OR THE USE OF COMPO,
REQUIRING THE CONSTANT EXPENSE OF PAINTING. EXTERNAL WALLS FACED WITH AN INDESTRUCTIBLE MATERIAL.

STONE-FACED BUILDINGS AT LITTLE MORE COST THAN CEMENT.

No necessity for Iron Cramps and Bond-stones, and the Stone Ashlar never injuriously weighted by the settlement of the Mortar joints of the inside Brickwork. The INSIDE of CHURCHES and OTHER BUILDINGS FACED WITH STONE instead of Plastering. Also Dining halls, Lobbies, Staircases, &c. of Private Residences. It can be had ready for fixing from the quarries at a small cost for carriage, or prepared at home. Can be used with the ordinary Bricks of any locality, and by the ordinary workman. The CHURCH faced inside and outside in this manner, and the other Buildings at SPRING GROVE HOUNSLOW, and elsewhere, can be inspected, and all particulars obtained, of

Mr. JOHN TAYLOR, ARCHITECT, OFFICES OF THE COMPANY, 40, KING-STREET, CORNER OF CHEAPSIDE.

TO ARCHITECTS, BUILDERS, CONTRACTORS, AND OTHER CONSUMERS OF GLASS.

HARTLEY'S PATENT ROUGH PLATE GLASS,

1-8th of an inch thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th or 4 lbs. is now universally used for

RIDGE AND FURROW ROOFS, GREENHOUSES, RAILWAY STATIONS, MILLS, MARKET HALLS, BATHS AND WASH-HOUSES, FACTORIES, WORKSHOPS, SHIP-BUILDING SHEDS, AND OTHER EXTENSIVE BUILDINGS.

By a carefully prepared Estimate, it has been ascertained that **FOUR-FIFTHS** of the **ROUGH PLATE**, or non-transparent Glass, consumed in the United Kingdom in 1854, was manufactured by HARTLEY'S PATENT—thus affording the most incontestable evidence of its superiority over every other article of the kind, and as being the only description of Glass suitable for the purposes above named. It combines size and strength with economy of cost, and is manufactured in sizes expressly for RIDGE and FURROW ROOFS, giving a SPAN of TWELVE FEET, at a price not exceeding, weight for weight, that of Common Crown Glass. Its non-transparency renders BLINDS UNNECESSARY, and no scorching occurs in Greenhouses glazed with it; hence the preference given to this Glass for all Horticultural purposes.

For further particulars, apply to

JAMES HARTLEY AND CO. SUNDERLAND; AND PURFLEET WHARF, EARL-STREET, BLACKFRIARS, LONDON.

Sole Manufacturers of Lockhead's Patent Perforated Glass for Ventilation.

*** *Hartley and Co.'s Glass Tariff Newspaper will be forwarded gratis, on application.*

OAK CABINETS, Buffets, Octagon Library and Occasional Tables, Benches, Chairs, and other useful and appropriate Furniture
The whole of the above-mentioned Furniture, &c. is designed by the late Mr. A. W. PUGIN, Architect.
To render this Furniture generally available, a considerable portion has been arranged in the simplest manner, consistent with its ancient character.

14, Wigmore-street, January, 1853.

CHEAP, LIGHT, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT,

has been extensively used and pronounced efficient, and particularly applicable for warm climates.

1st. It is a non-conductor.—2nd. It is portable, being packed in rolls, and not liable to damage in carriage.—3rd. It effects a saving of half the timber usually required.—4th. It can be easily applied by any unpractised person.—5th. From its lightness, weighing only about 42 lbs. to the square of 100 feet, the cost of carriage is small.—6th. Under slate, metal, or tiles, it is a most effective non-conductor.

INODOROUS FELT, for damp walls and for damp floors, under carpets and floor cloths. Price ONE PENNY per Square Foot.

CROGGON and CO.'s PATENT FELTED SHEATHING, for Covering Ships' Bottoms, &c., and

NEAR BARNSLEY, YORKSHIRE.

The Proprietor, E. B. BEAUMONT, manufactures every description of STONEWARE for drainage and sanitary purposes, from clays which have been subjected to the most searching analyses, and proved to be of the most tenacious and indissoluble qualities. The pipes are wrought by Spencer's Patent Machine, by which tube and socket are one, without a manipulated joint, and rendered the more compact by high pressure; and as every improved apparatus has been made available to secure the highest excellence with great economy of labour, the goods are put upon the market at a considerable reduction from the prices charged for others at all approximating in quality, whilst the stock on hand is always sufficiently large to provide for works of the greatest magnitude.

THE TRADE LIBERALLY TREATED WITH.

Price lists and Diagrams sent free on application.—

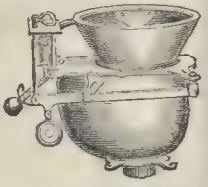
kinds and colours of Tiles, Quarries, Drain pipes, Moulded Bricks, Brackets, Vases, Chimney-pots, Stoneware Glazed Sewerage Pipes, Ornamental Quoin Blocks, &c.

Tyndale, Staffordshire



LAMBERT'S PATENT WATER WASTE

PREVENTER, and SELF-REGULATING VALVE-COCK, especially adapted for Water-closets.

FIG. 1. (a)

FIG. 2.

This Valve is so arranged, that whether it be held down propped up, only a given quantity of water can be used at each action.

The pressure of the column of water, at its vertical height being known, a quart, gallon, or any other quantity desired will be (and no more can be) discharged, and before a second quantity can be obtained, a second action must take place.

This Valve is capable of several modifications; one of its applications to the Pan Closet, as shown in Fig. 2 is important, as it renders unnecessary any other appliance to regulate the discharge of water; it can be made to keep open as long or short a time as may be desired, after the handle which operated upon it is left free.

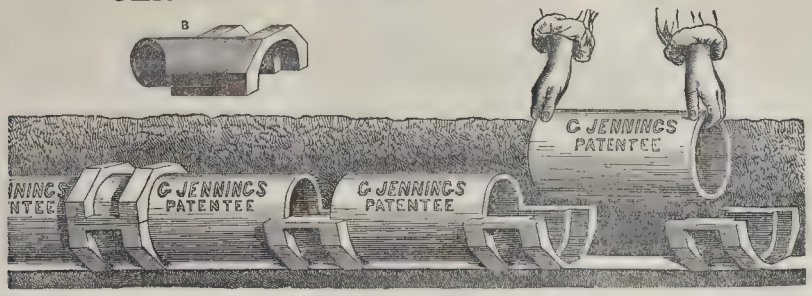
It is yet more valuable when applied to self-acting Closets, as it dispenses entirely with reservoirs or supply cisterns; once regulated, say for one gallon, that quantity will always be discharged at each action of the seat by its pressing upon the stud a, or by any other movement.

The Patentees have tested them under every pressure up to 300 feet with complete success.

THOS. LAMBERT and SON,
Founders and Manufacturers of High-pressure Water-Vals,
Plumbers' Brass Work, Pumps, &c.
SHORT-STREET, NEW-CUT, LONDON.

REDUCTION IN PRICES.

PATENT DRAIN-PIPES, UNGLAZED,



manufactured by ARTHUR O. FRANCIS and CO. Ogre, Essex, sold by them, and by FRANCIS, BROTHERS, Mr. Elms, London, and at all their Warehouses.

PRICES.

3 inch bore, in 2 ft. 6 in. lengths, at				2½d. per foot.
4	"	"	"	3½d. "
6	"	"	"	5½ "
9	"	"	"	9d. "
12	"	"	"	1s. 3d. "
15	"	"	"	2s. 6d. "

These pipes are made under steam pressure, and burnt to great hardness, and are capable of bearing nearly double the hydraulic pressure of ordinary glazed pipes. The production of stoneware is overcome by this manufacture, and it is well known that good earthenware, UNGLAZED, is the oldest material discovered in a perfect state in Rome, Babylon, Nineveh, &c. &c.

JENNINGS'S PATENT DRAIN-PIPES.

THE PATENT CHAIRS AND SADDLES above shown are to a line of pipes the SAME SUPPORT AS SLEEPERS TO A LINE OF RAILWAY, the base of each Chair being BROAD and STRONG. The pipes are simple cylinders, of uniform thickness, made without the usual socket; the drying and burning, in consequence, is much more perfect. Pipes thus made and connected will be found to BEAR ANY PRESSURE, and are in no way liable to derangement. The laying of these pipes, and the making of the joints, IS DONE AT ONCE, EACH PIPE BEING BEDDED AS IT IS LAID, and the space between allows the workman to strike up the joint, and the superintendent TO SEE that every pipe is ACCURATELY LAID and PROPERLY JOINTED.

B shows one of the PATENT JUNCTION COVERS, by which connections are made to finished lines of pipes, it being only necessary AT ANY TIME to remove a PLAIN Cover or Saddle, and substitute a Junction Cover, the Junction being THE SIZE of the Branch Pipe.

The favour with which these pipes have been received will no doubt give rise to many imitations, AS IT IS MUCH EASIER TO COPY THAN TO INVENT; but GEORGE JENNINGS hopes his sanitary patrons will give HIM CREDIT for being THE FIRST TO SHOW HOW JUNCTIONS MAY BE INTRODUCED, OR EXAMINATIONS MADE, TO FINISHED LINES OF PIPES. These important improvements, as above shown, are PATENTED; and GEORGE JENNINGS would caution those who desire TO PROFIT BY HIS IDEAS, NOT TO INFRINGE HIS PATENT RIGHTS, as they will not be allowed to do so with impunity, although he feels confident the ORIGINAL, for its SIMPLICITY and EFFICIENCY, will be preferred to the attempted Copy, the provisional specification of which was not proceeded with, although STILL CALLED PATENT.

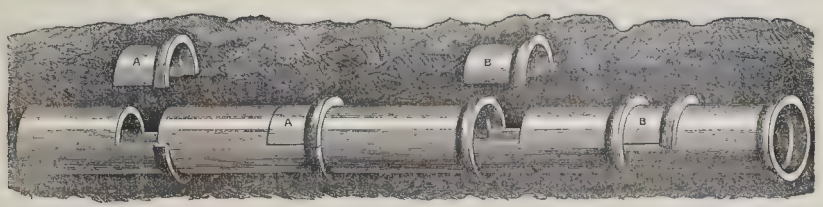
Prices of JENNINGS'S Drain Pipes, per foot run, including the Patent Chair and Saddle, are as follows:—4-inch, 6d.; 6-inch, 8d.; 9-inch, 1s. 1½d.; 12-inch, 1s. 10d.; 15-inch, 3s.; 18-inch, 4s.; with the usual discount to the Trade.

JENNINGS'S PATENT DOUBLE-SEATED VALVE-CLOSET.

Architects describing this Closet in their specifications will have a PERMANENTLY GOOD VALVE CLOSET, NOISELESS, and FREE FROM COMPLICATION. The Patentee has such confidence in its DURABILITY and EFFICIENCY, that he will guarantee every Closet for SEVEN YEARS.

JENNINGS'S IMPERISHABLE EARTHENWARE CLOSET AND TRAP.

This Closet has a large water surface, has no back to soil, is imperishable in its material, and the Trap and Closet are combined in one piece, suited alike for the PALACE or the COTTAGE.



JENNINGS'S IMPROVEMENTS IN LIFT AND OTHER PUMPS.

These Pumps would well repay a visit to Jennings's factory, where may be seen Jennings's Lavatories, Urinals, Sluice Valves, Fire and Steam Cocks, of every size; Shop-Shutter Shoes; Gully, Area, and Sink Traps, and other sanitary goods.

Or Illustrations and Prices can be had free by post, if two stamps are enclosed to

GEORGE JENNINGS, SANITARY ENGINEER, HOLLAND-STREET, BLACKFRIARS-ROAD, LONDON.

AYLESFORD POTTERY COMPANY'S PATENT DRAIN-PIPES.

THE above Company respectfully invites the attention of Engineers, Architects, Surveyors, Builders, &c. to an improved DRAIN-PIPE, whereby all stoppages may be cleared without disturbing the invert of the drain, by simply removing the cover (marked A or B) whichever may be preferred.

The cover (marked B) may be used in conjunction with whole or half-socket Pipes.

Pipes thus constructed may be laid at intervals in a drain of ordinary Socket-Pipes.

With the great advantage these Pipes offer, they are cheaper than any yet submitted to the public.

FULLER and HORSEY, Billiter-street, City.

IMPORTANT WATER-SIDE PROPERTY, ON THE PREMISES, IN THE CITY OF LONDON.

MESSRS. FULLER and HORSEY are instructed by William Crawshay, Esq. to SELL by AUCTION, on WEDNESDAY, OCTOBER 15, at TWELVE, at the MART (unless an acceptable offer is previously made by private contract), a splendid MERCANTILE PROPERTY held under the Corporation of London, known as George-yard, Upper Thames-street, in the city of London, having a frontage next the Thames of 225 feet, and occupying a superficial area of about 34,000 square feet, a site unrivalled in the metropolis, either as a depôt for landing and housing goods or for carrying on any wholesale business for which extensive waterside premises are desirable. George-yard is universally known as the London establishment of Mr. Crawshay, the eminent ironmaster, and has been in the occupation of himself and predecessors for more than a century. The trade carried on ranks among the first in the City, the returns are very large, and, to any firm wishing to occupy the premises for the same business, a large premium for the connexion may doubtless be secured. In the year had the occupier expended many thousands of pounds in the erection of a massive pile of buildings 160 feet in length by 65 feet in width abutting on to the river; the structure is of the most substantial character, and, if needed for the purpose of warehousing goods, the foundation and walls are quite equal to support an elevation of several stories above those already erected. The building is one lofty groundfloor, with gallery supported on iron girders and columns, and constructed to carry any weight. There is also a stack of warehouses, abutting on the river, 75 feet in length, of two floors, and a stack of warehouses, 60 feet in length, of three floors, abutting on Thames-street. A commodious dwelling-house in the yard, the lower part occupied as offices for clerks and principals. A comfortable dwelling-house in Thames street, and spacious paved yards, with two separate entrances, affording every convenience for loading and drawing goods. The whole held on lease from the Corporation of London, for a term which will expire in the year 1900, subject to each rent of 190l per annum. A stack of ware houses adjoining, of three floors, with frontage of 34 feet to Castle yard, may be added if desired, at a rent of 150l per annum To be viewed till the sale. Printed particulars and plans will shortly be ready and may be obtained of the Solicitors of Messrs. CROWDER and MAYNARD, Solicitors, 57, Coleman-street; and of Messrs. FULLER and HORSEY, Billiter-street, London

VICTORIA-STREET, WESTMINSTER.—Important Sale of new Building Materials, Pipe, Stock, and Out Builder

MESSRS. FULLER and HORSEY are instructed to SELL by AUCTION, on THURSDAY SEPTEMBER 11, 1856, and following days, at ELEVEN o'clock each day, on the PREMISES, Victoria-street, Westminster, in lots (without reserve), an important stock of well-seasoned NEW BUILDING MATERIALS, partly prepared, adapted for first-class buildings; including 2,000 feet 2-inch sashes, glazed with plate-glass; 3,000 feet ditto, glazed with sheet-glass; 400 feet 2 inch margin sashes with ornamental glass; 500 feet ditto, not glazed; 6,400 feet 2-inch sash-tubes 4,000 feet 2-inch casings and frames, 1,000 feet 2-inch French casements and frames, 500 feet 2-inch Venetian sash frames, 2,000 feet 1¼ and 2 inch doors moulded and square panels, 300 squares 1-inch, 1¼, and 2-inch yellow and white deal flooring boarded, 5,000 feet moulded architraves, 1,650 feet 6 by 4½ door-frame, 50 feet cube Portland stone 500 feet cube Bath stone 10 yards, 5,000 feet self-faced ditto, 2,000 feet York landings, 350 feet run York 20 cwt. 70 feet cube granite two Moira iron girders, 90,000 stock and fire-bricks 40 tons cast iron rain-water-pipe, 20 register and hall stoves, 20 black and bright finishers, 40 marble chimney-pieces, 15 gas fronts, 10 open ranges, 12 gas stoves, 30 coils iron-pipe 8 galvanized tanks, gas brackets and pendants, 10,000 feet iron tube, an assortment of Ts, elbows, bends, sockets, &c. 30 cwt. slooping, 5,000 feet inch boards, 200 feet quarters and corners, 200 feet muslin pattern glass, 500 feet polished embossed, and ground plate-glass, 300 feet stained glass, 50 gallons varnish, 20 cwt. white lead, 10 cwt. white zinc, and 1,000 pieces paper-hangings, 5 tons sheet and pipe lead, traps, service boxes, &c. 4 cwt. brass tube, 10 cwt. of brass castings dusters, brushes, pencils, &c. TO CAPITALISTS BUILDERS, SPECULATORS, and Others KINGSLAND.—Important Sale of Improved Ground Rents, amounting to 93l per annum, secure upon newly 150 Houses, with valuable Reversionary Interest in the rack-rents, amounting to 2,500l per annum.

PULLEN and SON are directed by the Trustees and Executors of Mrs Mary Robinson, deceased, to SELL by AUCTION, at the MART, on THURSDAY, SEPTEMBER 18, at TWELVE in one lot, a highly-important LEASEHOLD ESTATE, consisting nearly of five acres of land now covered with houses, including thirty-three residences, with gardens, forming the whole of Robinson's-row, in the front of the high-road, Kingsland, closer to the railway station; also the Cock and Castle and Eagle Public houses, the Birkbeck Schools, the whole of Wellington-street, Castle-street and Henry-street, numerous houses in Orchard-street, Bridge-place, &c. extending in the rear to the Mildmay Estate, at Newington. The entire property is held for a term expiring at Christmas, 1893, at a ground-rent of 96l. 6s. and is underlet at ground-rents amounting to 630l per annum. The under leases are nearly all granted for shorter terms than that of the original lease, and several of the under-leases expire at Christmas next. The purchaser will commence into possession of the rack-rents of a large portion of the property (and the other portion as the various under leases fall in) for the remainder of the unexpired term of the original lease, estimated at 236l per annum.—May be viewed by leave of the tenants; and particulars had of Messrs. TYRRELL, PAINE, and LAYTON, Solicitors, Gresham Hall-yard, at the Mart; and of PULLEN and SON, 80, Fore-street, Cripplegate

The valuable Materials and Fittings-up of Clothworkers' Hall and several H uses adjoining, in Mincing-lane

PULLEN and SON are favoured with instructions from the Wardens of the Company of Clothworkers to prepare for SALE by AUCTION on the PREMISES, on TUESDAY, SEPTEMBER 16th, and following day, at TWELVE, in lots, the entire BUILDING MATERIALS, FIXTURES, remaining FURNITURE, and FITTINGS-UP of Clothworkers' Hall and several houses adjoining, in Mincing-lane. Detailed particulars will appear in a few days, when catalogues may be had of Messrs Beckwith, Towse, Esq. Clothworkers' Hall; of SAMUEL ANGELL, Esq. Architect, 16, Russell-square; and of PULLEN and SON, 80, Fore-street Cripplegate

SYDENHAM To CONTRACTORS, BUILDERS, and OTHERS

MR. MARSH has received instructions from the Executors of the late Thos. Hunt, esq. to SELL by AUCTION, on the PREMISES, Kirkdale-road, Sydenham, on THURSDAY, SEPTEMBER 11, 1856, at THREE for FOUR o'clock, in convenient lots 600,000 of superior STOCK, PLACE, and other BRICKS. The premises are 1 mile from railway stations, and in the vicinity of excellent roads.—May be viewed the day prior and morning of sale, and catalogues obtained on the Premises; the principal Inns of the neighbourhood; and at Mr. MARSH'S Offices, 2, Charlotte-row Mansion-house

BELMONT WHARF, MAIDEN LANE KING'S-CROSS.—Immediate Clearance Sale of the remaining portion of a Timber Merchants' Stock in

MESSRS. WHITE and SONS, of Dorking, under instructions received from the arbitrator, in closing a partnership account, will SELL by AUCTION, on FRIDAY, SEPTEMBER 19th 1856 at ELEVEN o'clock (including a quantity of good oak, ash, beech, elm, and hornbeam plank, elm boarding oak 3in. scantling, ash rails, gates, grave boards, pales; larch rails and posts, stocks, felloes, and other useful wheelwrights' material). Catalogues may now be obtained of Wm. Flowers, on the Wharf; also at the City of York Tavern, near thereto; of Mr. WEAKLIN, Stationer, 91, Farringdon-street, London; and of the Auctioneers, Dorking, who will forward them on application by post.

LIVERPOOL Valuable Property, in the immediate vicinity of the Lime-street Station of the London and North-Western Railway

MR. BRANCH, on FRIDAY, the 19th of SEPTEMBER instant, at TWO o'clock in the afternoon, at the CLARENCE ROOMS, South John-street, Liverpool, subject to conditions of sale to be then produced, in three lots, three Freehold Dwelling-Houses, situate in the Second Wellington Building Society, the CEMENT WORKS, WAREHOUSE, and PREMISES, situate on the south side of Lord Nelson-street and at the east side of Hotham-street, in Liverpool, late in the occupation of Mr. G. H. Newton. The site of the premises comprises in front to Lord Nelson-street, 61 feet, when it turns off and runs in a southwardly direction, 13 feet 7 inches, when it again turns off and runs along Hotham-street, 55 feet, on the east side to a common passage of 3 feet wide, 51 feet, and on the south side for 4 inches, and in the whole 319 yards, or thereabouts. The buildings have been recently erected in a very substantial manner, and are fitted up with a steam engine, and every other requisite for carrying on an extensive trade; but they are capable of being converted (such conversion having been contemplated in their original construction), at a moderate expense, into an hotel, for which the locality cannot be surpassed. Immediate possession may be had. The tenure is freehold of inheritance. For further particulars, apply to Messrs. C. and J. ELLISON, 38, Renshaw-street; or to Mr. WILLIAM FOSTER, Solicitor, 40, North John-street, Liverpool.

SALES BY AUCTION.

The Stock of a Timber Dealer and Builder

MR. LEREW will SELL by AUCTION, on the PREMISES, No. 43 Union-street Somers-town, on MONDAY, SEPTEMBER 15, at TWELVE, about 2,000 PLANKS, DEALS, and BATTENS; 180 squares of flooring, 10,000 feet scantling, fifty doors, dry cut stuff, pulpit, fourteen benches, ironmongery, scaffold-poles, boards and cords, ladders, work-benches, tools, and utensils in trade.—Auction Offices, Cardington-street, Hampst ad road.

TO STONEMASONS, BUILDERS, CONTRACTORS, and OTHERS.—400 Tons of Portland, Bramley Fall, and Caen Stone, in blocks to be SOLD by AUCTION, by

MR. SITGRAVE, on TUESDAY, SEPTEMBER 16th, at ONE o'clock precisely, on the PREMISES, Devon Wharf (near new Globe-bridge). Mile-end, by direction of the proprietors, 300 blocks, containing 6,400 feet of PORTLAND, BRAMLEY FALL, and CAEN STONE, of the finest quality, and chiefly of large dimensions and lengths, up to 13 feet, suitable for balconies, landings, steps, and other building purposes. Also, 10,000 feet of sawn Hare-hill and Potter Newton Slat, now lying on the bank of the Regent's Canal, with every facility for water or land carriage.—May be viewed three days prior to the sale, and catalogues had on the Premises; and of the Auctioneer, at his Offices, 28, Leadenhall-street; or will be forwarded per post on application.

TO TIMBER MERCHANTS, BUILDERS, PACKING-CASE MAKERS, SHIP-BUILDERS, COACH-MAKERS, CABINET-MAKERS, ORGAN-BUILDERS, PIANOFORTE-MAKERS, AND OTHERS.—On the Premises, Snow's-fields, King-street, Borough, within five minutes' walk of the London-bridge Terminus; and Robinson and Bartram's Saw-mills, Swan-street, Grange-road, Bermondsey.

MR. PEAKE is favoured with instructions from the Executors of the late Thomas Elliston, esq. Timber Merchants to SELL by AUCTION, upon the PREMISES, Snow's-field, Bermondsey, on TUESDAY, SEPTEMBER 9th, 1856, and Three following days, at TWELVE o'clock each day, at ROBINSON and BARTRAM'S Saw-mills, Swan-street, Grange-road, Bermondsey, on TUESDAY, SEPTEMBER 16th, at TWELVE for ONE, his well-known, superior, and thoroughly SEASONED STOCK in TRADE, comprising 25,000 feet Spanish and Honduras mahogany, in plank and boards; about 18,000 planks, deals, and battens; flooring-boards, match lining, 1,000 feet wainscot, Spanish, Honduras, rosewood, and walnut veneers; 500 feet Spanish curl logs, a large quantity of perfectly dry wide pine, Honduras boards, carriers' tables, oak seasoning and wedges, about twenty loads of bulk timber, &c. &c.—May be viewed Saturday and Monday previous and mornings of sale. Catalogues obtained on the Premises; at Robinson's Saw-mills; and at Mr. PEAKE'S Offices, 44, Tooley-street, South wark. Approved bills at three months will be taken from purchasers to the amount of 20l. and upwards. Luncheon provided.

TO BUILDERS and OTHERS.—TO BE DISPOSED OF, the BUSINESS of the late Mr. HOWE, Bricklayer Plasterer, and General Repairer, No. 2, Portland-road, Marylebone. For terms, apply as above

CARPENTER, BUILDER, and HOUSE DECORATOR'S, close to Eaton and Belgrave Squares.—W. H. JOHNSON is instructed to LET the above, changed hands only once in thirty-two years. The trade will be satisfactorily proved. A commodious House and Premises as a moderate rent, in lease Terms low, and every satisfactory reason given for retiring.—Apply at the Auctioneer's City Office before THREE, at 37, Cornhill-street. Bishopsgate; and before SEVEN, at 73, Connaught-terrace, Edgeware road Letters must enclose 2 stamps.

TO PLUMBERS, GLAZIERS, PAINTERS, &c.—The Proprietor of an excellent BUSINESS, which he has since successfully carried on for twenty-six years (being about to retire), seeks a SUCCESSOR. This is an opening having unusual advantages, and I write the attention of any one desiring to embark in business.—Satisfactory information on application (if by letter, enclosing stamp), to R. A. 13, Artillery-place, Finsbury-square, London.

TO PLUMBERS, PAINTERS, and BUILDERS.—TO BE DISPOSED OF, an old-established BUSINESS, at the west-end of London, in the above line. This presents a very eligible opportunity to any young man desirous of commencing business.—Particulars may be obtained confidentially by principals only, on application to Mr. CHARLES BRADLEY, Surveyor, 24, Nottingham-street, St. Marylebone.

TO ZINC WORKERS, PLUMBERS, BUILDERS, &c.—TO BE SOLD, a BUSINESS in the above line; situation the most favoured in the metropolis: permanent success certain, and no risk; very moderate means required for stock, tools, &c. and for conducting the present established trade and future extension of connexion; the most valuable to a manufacturer, being principally for family and private use. Principals only treated with, and letters paid. Rent very low.—For particulars apply at the Lead Works, 51, Marylebone-lane, Oxford street.

BUILDER'S BUSINESS FOR DISPOSAL. TO BE DISPOSED OF, by order of the Executors, an old-established BUSINESS, with a first-rate connection, situate in a small country town about thirty miles from London. The works executed by the late proprietor have gained for the concern a high reputation; they have included the erection and restoration of several churches and others, both of a substantial and ornamental character. The premises are very complete in their arrangements: the rent nominal, and the stock well selected. The amount required will be from 1,200l to 1,500l. There are several advantageous contracts in hand, which will be included in the purchase. The business has been conducted by the late proprietor and his ancestors for more than half a century, and to any practical man of business a favourable opportunity can rarely be met with.—For further particulars, apply to Messrs. FULLER and HORSEY, Billiter-street, City.

TO ENGINEERS, BOILER-MAKERS, and OTHERS.—TO BE DISPOSED OF, the STOCK and PLANT of an ENGINEER and IRONFOUNDER, situate in a large seaport town in the south of England. The premises are spacious and well-arranged, with great facilities for land and water-carriage. The plant now at work is capable of employing a full staff of hands. As the tools are all in good order, and the business is well established, this is a favourable opportunity for an enterprising person with a moderate capital.—Letters to be addressed to D. TAYLOR, Esq. Kennington-park, Surrey.

TO BUILDERS.—TO BE LET, on building or repairing lease, a PROPERTY in Westminster, belonging to Corpus Christi College, Cambridge, consisting of an entire street containing TWENTY-SIX HOUSES, and a Stable-yard, Coach-houses, and Stables. The property is compact, and is situate opposite to her Majesty's Stationery Office, and in the immediate neighbourhood of the proposed Government improvements and of St. James's-park, and is respectably tenanted.—For particulars apply to E. M. FOXHALL, Esq. District surveyor of St. George's, Hanover-square, at his Office, 148, South-street, South Audley-street, between the hours of TEN and FOUR o'clock.

LONDON: Printed by CHARLES WYMAN, of 13, Hunter-street, Brunswick-square, in the Parish of St. George, Bloomsbury, Printer, at the Printing-office of COX (Bros.) & WYMAN, 74 & 75, Great Queen-street, Lincoln's-inn-fields, in the Parish of St. Giles-in-the Fields; and published by the said CHARLES WYMAN, at the Office of "THE BUILDER," 1, York-street, in the Parish of St. Paul, Covent Garden, all in the County of Middlesex.—Saturday, September 6, 1856.

The Builder,

ARCHITECTURAL EXHIBITION.—All

drawings, models, photographs, &c must be delivered at the Galleries, Suffolk-street, Pall-mall East, on the 1st or 2nd of DECEMBER. Printed rules will be forwarded on application to the Honorary Secretaries.

DEPARTMENT for MATERIALS. Patents, &c connected with Building. Applicants should apply immediately to Mr. JAS. EDMESTON, Honorary Secretary, as most of the space is already engaged. This will be found the best, and indeed the only certain, means of bringing articles exhibited under the notice of the whole body of architects of London and the country, and of all persons connected with building.

The Committee are glad to add the following names of gentlemen who will act as Local Honorary Secretaries to the list already published, and they trust that others will follow their example in the many important localities not yet so provided:—

BIRMINGHAM	JAMES GOODMAN, Esq.
DUBLIN	WILLIAM WIGGINTON, Esq.
DUBLIN	JOHN S. SLOANE, Esq.
GUILDFORD	THOMAS GOODCHILD, Esq.
OSWESTRY	JAMES BLAKE, Esq.
SWINDON	E. W. MANTELL, Esq.
WINCHESTER	JOHN COLSON, Esq.

The Committee have much gratification in adding the names of Mr. THOMAS ALLOM and Professor DONALDSON to the list of Lecturers already published.

JAMES FERGUSSON, 20, Langham-place, } Honorary
JAMES EDMESTON, jun. 5, Crown-court, Old Broad-st } Secretaries.

COMPETITIONS.

TO SURVEYORS and OTHERS.—PREMIUMS for PLANS.—The Trustees for Sale of a Freehold Estate of 560 acres, including the Beulah Spa, and near the Crystal Palace, require PLANS for LAYING OUT the SAME for building purposes, showing the necessary roads, sewers, &c. the whole to be clearly defined and appropriated in suitable lots, and laid down to a scale of two chains to an inch, from actual admeasurement. The following premiums are offered:—For the plan adjudged the best by the trustees, 150 guineas; for the second, 100 guineas; for the third, 50 guineas. The plans to which the above premiums shall be awarded, will be retained by and be the property of the trustees.—Further particulars may be obtained of Mr. PEACOCK, Builder, near the Jolly Sailor Station, Norwood, close to the property. The trustees will meet on the 20th day of OCTOBER next, to examine the plans, which are to be previously forwarded, enclosed and sealed, to the Secretary's Office, Auction Mart, London, addressed to the Trustees of the White Horse, Norwood, Estate.

PLAN and ESTIMATE for CEMETERY.—The Burial Board for the Parish of Saffron Walden, in the County of Essex, are desirous of receiving PLANS and ESTIMATES for LAYING OUT and PLANTING their NEW CEMETERY. The ground contains about 6 acres, a plan of which may be seen, and further information obtained at my Office. The party whose plan is approved will be paid the sum of five guineas, and such plan to be the property of the Board. The plans and estimates must be delivered at the Office of the Clerk to the Board, on or before MONDAY, the 22nd of SEPTEMBER instant. SIMEON JOHN KING, Clerk to the Board.

Saffron Walden, Sept. 4, 1856.

WELLINGTON MONUMENT.—The Commissioners of her Majesty's Works and Public Buildings give Notice, that it is the intention of her Majesty's Government to ERECT a MONUMENT in St. Paul's Cathedral, London, to the memory of the late Duke of Wellington, and that the Commissioners are prepared to receive DESIGNS for the same from artists of all countries. A drawing, showing the ground plan of the cathedral and the site of the proposed monument, together with a statement of the premiums, and other particulars, will be forwarded to artists on application, by letter, addressed to me at this Office.

ALEXR. J. AUSTIN, Secretary.

Office of her Majesty's Works and Public Buildings, Whitehall, London, September 6th, 1856.

CONTRACTS.

TO BUILDERS.—Persons desirous of CONTRACTING for certain WORKS required to be performed on the Premises of the Surrey Consumers' Gas Company at Rotherhithe, may see the plans and specification by applying at the Company's Offices in Robert-street, any day between the hours of TEN and FOUR o'clock. Tenders addressed to the Directors, sealed and endorsed "Tender for Works," are to be personally delivered at the Offices as above, on TUESDAY, the 23rd SEPTEMBER instant, at HALF-PAST TWO o'clock in the afternoon, precisely. The Directors will not be bound to accept the lowest or any Tender.—By order.

W. P. BODDY, Secretary.

Rotherhithe, Sept. 5, 1856.

NOTICE to CONTRACTORS and BUILDERS.—TENDERS will be received by the Director-General of Contracts, War Department, Pall-mall, London, on or before the 8th OCTOBER next, from such persons as may be willing to enter into a CONTRACT for the CONSTRUCTION of a FORT, near the village of Eastney, in the county of Hants. Plans and specifications may be seen, and every information obtained on application at the Royal Engineer Office, Gosport, between the hours of TEN and FOUR daily, from the 15th SEPTEMBER to the 8th OCTOBER, 1856. No notice will be taken of any Tender unless upon the printed form. The War Department reserve to themselves the right of rejecting the whole or any of the Tenders.

Royal Engineer Office, Portsmouth, August 23, 1856.

NOTICE to BUILDERS.—ORDNANCE CONTRACT.—The Principal Officers of her Majesty's War Department hereby give Notice, that they will receive proposals for a CONTRACT, to be entered into forthwith, for the several Works proposed in the ERECTION of QUARTERS for NON-COMMISSIONED OFFICERS and MARRIED SOLDIERS, Laundry, Dead-house, and Privy, together with Refortifying a Portion of the Boundary wall, &c at Beggar's-bush Barracks, Dublin. Persons desirous of Tendering for the same, will receive every information on application at the District Commanding Royal Engineer's Office, Lower Castle-yard, Dublin, and may obtain specifications, with the terms of contract. The boundary wall to be completed and the buildings roofed in by the 1st March, 1857, and the remainder of the Works to be completed on or before the 31st July, 1857.—The letters of Tender, with specifications, to be sealed, and transmitted, under cover, to "The Director-General of Contracts, War Department, Pall-mall, London," so as to be received not before the 18th day of SEPTEMBER, 1856, and to be marked on the outside, "Tender for Work at Beggar's-bush Barracks, Dublin."

Commanding Royal Engineer's Office, Dublin, 26th August, 1856.

NOTICE to BUILDERS.—ORDNANCE CONTRACT.—The Principal Officers of her Majesty's War Department hereby give Notice, that they will receive PROPOSALS for the following CONTRACT, viz.—For the several WORKS proposed in the ERECTION of CAVALRY QUARTERS and STABLING, together with OUT-BUILDINGS, &c. in the BARRACKS at ISLAND BRIDGE, Dublin. Persons desirous of Tendering for the same will receive every information on application at the District Commanding Royal Engineer's Office, Lower Castle-yard, Dublin; and at the Royal Engineer's Office, Island Bridge Barracks; and may obtain specifications, with the terms of contract. The soldiers' ablution-room to be completed, and all the buildings roofed in, by the 1st of MARCH, 1857, and the remainder of the works completed, on or before the 31st of AUGUST, 1857. The letters of Tender, with specifications, to be sealed, and transmitted, under cover, to "The Director-General of Contracts, War Department, Pall-mall, London," so as to be received on or before the 16th day of SEPTEMBER, 1856, and to be marked on the outside, "Tender for Work at Island Bridge Barracks, Dublin."

Commanding Royal Engineer's Office, Dublin, August 29, 1856.

NOTICE to BUILDERS and CONTRACTORS.—The Commanding Royal Engineer at Guernsey, hereby gives Notice, that sealed TENDERS will be received by the Director-General of Contracts, War Department, Pall-mall, London, until TUESDAY, the 23rd of SEPTEMBER, 1856, for CONSTRUCTING a small BATTERY, ERECTING BARRACK BUILDINGS, with enclosure walls, &c and FORMING DITCHES, GLACIS, and PAD, at HOMMET POINT, in the Island of Guernsey. Detailed drawings of the works may be seen, and every requisite information obtained, on application at the Royal Engineer Office, Guernsey, every day (Sundays excepted), between the hours of NINE and FOUR. The terms of contract, specification for the works, and forms of Tender, may be procured at the Office of the Inspector General of Fortifications War Department, Pall-Mall, London, as well as at the Royal Engineer Office, Guernsey. Each Tender to be in one lump sum, in British sterling, for the whole work, to be attached to a copy of the terms of contract and specification, addressed to "The Director-General of Contracts, War Department, Pall-Mall, London," and endorsed, "Tender of Works at Hommet, Guernsey." The War Department reserve the right of rejecting any or all of the Tenders.

Royal Engineer Office, Guernsey, August 27, 1856.

NOTICE to BUILDERS and CONTRACTORS.—WAR DEPARTMENT WORKS.—The Commanding Royal Engineer at Guernsey gives notice that TENDERS for the ERECTION of a FORT and BARRACK BUILDINGS, on Richmond hill, Guernsey, will be received by the Director-General of Contracts, War Department, Pall-mall, London, until SATURDAY, [illegible] at [illegible] Detailed drawings, specifications, and every requisite information obtained, at the Royal Engineer Office, Guernsey, on and after the 9th instant. Tenders for the above works to be forwarded from the Royal Engineer Office, Guernsey, and to be addressed to "The Director-General of Contracts, War Department, Pall-mall, London," and endorsed "Tender for Erecting a Fort and Barrack at Richmond-hill, Guernsey."

N.B.—The War Department reserve the right of rejecting any [illegible] Tenders.

Royal Engineer Office, Guernsey, 30th August, 1856.

CONTRACTS.

TO BUILDERS.—Sealed TENDERS for BUILDING NEW BARRACKS for non-commissioned officers and married soldiers, at Devonport, including all requisite Fittings; also, separate Tenders for the Asphalte Work required for same, will be received at the War Department, Pall-Mall London, on or before TUESDAY, the 16th SEPTEMBER next, at NOON, addressed "To the Director-General of Contracts," and endorsed "Tender for Married Soldiers' Barracks, Devonport," "Asphalte Work for Married Soldiers' Barracks Devonport" (as the case may be), on the left-hand corner of the envelope. The barrack comprises—three blocks of two-storey buildings, laundry, cook houses, outbuildings, ash-pits, enclosure walls, gates, footpaths, roads, and parade.

Plans and specifications, with terms and conditions, may be seen, and forms for Tenders and every information obtained at the Royal Engineers Office at Devonport, between the hours of NINE and FOUR o'clock on week-days from MONDAY, the 15th, to SATURDAY, the 27th SEPTEMBER next, both days inclusive.

Royal Engineer's Office, Devonport, Sept. 3, 1856.

NOTICE to BUILDERS and CONTRACTORS.—ORDNANCE WORKS.—The Commanding Royal Engineer of the Dover district hereby gives Notice, that sealed TENDERS will be received at the Office of the Director-General of Contracts, Pall Mall, London, on or before SATURDAY, the 11th day of OCTOBER, 1856, from persons desirous of CONTRACTING for LINEN-EYE ADDITIONS and ALTERATIONS to the Fortifications at Dover Castle. Drawings and a specification of the works to be executed, may be seen (persons with competent skill to take the same from one others need apply), and forms of Tender obtained at the Royal Engineer Office, Dover, between the hours of TEN and FOUR o'clock, from THURSDAY, the 4th SEPTEMBER to FRIDAY, the 10th of OCTOBER, 1856 (Sundays excepted). The party whose Tender may be accepted for the work, will be required to enter into a bond, with two eligible securities in the sum of £1,000 each separately, to be bound under a penalty of 2,000l. for the due performance of the Contract. Tenders for the above work to be addressed to the Director-General of Contracts, Pall Mall, London, and endorsed "Tender for Work at Dover Castle."

N.B. The War Department reserve to themselves the right of rejecting the tender of any of the tenderers.

Royal Engineer Office, Dover, 1st September, 1856.

LANCASTER and CARLISLE RAILWAY.—To BUILDERS.—The Directors of the Lancaster and Carlisle Railway will meet at Carlisle, on the 24th day of SEPTEMBER, to receive TENDERS for the BUILDING of a SMITHY and other WORKSHOPS at Carlisle. The drawing and specifications may be seen at the office of the Engineer, at Lancaster, on the 18th day of SEPTEMBER, and at Carlisle Station from the 19th to the 18th of SEPTEMBER, both days inclusive. Tenders to be delivered at the Office of the Secretary, at Lancaster, before TEN o'clock on the 20th day of SEPTEMBER, having endorsed on the back, "Tenders for Workshops." The Directors will receive Tenders for the works as a whole or in separate trades, and they do not bind themselves to accept the lowest Tender. The Company will also be willing to let timber at Carlisle a pass on the Lancaster and Carlisle Railway, to and from Carlisle once a week. All materials for the work, except stone, bricks, sand, and lime, will be carried free along the Lancaster and Carlisle line.

TO BUILDERS.—TENDERS are requested for the ERECTION of a CONGREGATIONAL CHAPEL at Buckingham, the plans and specifications for which may be seen and had of Mr. WM. WALKER, Buckingham, or at the Offices of Messrs. POSTERS and WOOD, Architects, 4, Parkstreet, Bristol. The Tenders are to be sent to Mr. WALKER, sealed and endorsed "Tender for Chapel," on or before the 20th inst. The lowest or any Tender will not necessarily be accepted.

SUSSEX COUNTY LUNATIC ASYLUM.—To BUILDERS.—Persons willing to CONTRACT for sundry WORKS proposed to be done in ERECTING a SUPERLUNATIC ASYLUM for the County of Sussex, on a plot of ground selected for the purpose, and situate on Hurst House Farm, in the parish of Wivelsfield, about a mile and a half from the railway-station at Haywards Heath, are required to send in Tenders, sealed up and endorsed "Tender for County Lunatic Asylum," to my office, at Lewes, on or before TUESDAY, the 7th of OCTOBER next, after which time no Tender will be received. The works to be done under the direction of the Committee of Visitors and their Architects, or other persons appointed by them, agreeably to plans, specification, and conditions, which may be inspected at the Office of the Architect, Mr. H. E. KENDALL, Jun. 33, Brunswick-square, London, on any day after the 20th day of SEPTEMBER instant, between the hours of TEN am and SIX pm. The Committee will not be pledged to accept the lowest or any Tender, and the Contract will be required to enter into a Contract, and to give a bond, with sufficient security, to be approved by the Committee, in the sum of £5,000, for the due performance of the Contract. The plans can be obtained from Mr. THOMAS PERCY, of No. 1, Alfred-place, Bedford-square, London, Surveyor; and the usual charges of such surveyor are to be paid by the Contractor whose Tender may be accepted.

By order of the Committee of Visitors,
WM. POLHILL KELL, Clerk.

Lewes, September 6, 1856.

TO CONTRACTORS, BUILDERS, AND OTHERS.

TENDERS are required for the ERECTION of WEAVING SHEDS, &c at Kidderminster. The plans and specifications may be seen on and after MONDAY next, at the Offices of the Architects, Messrs. BIDLAKE and LOVATT, Market-place, Wolverhampton, between the hours of TEN and FOUR o'clock; and TUESDAY, the 23rd of which day is APPOINTED, all estimates are to be delivered to the Architects, sealed and endorsed "Tender for Weaving Sheds at Kidderminster." The Architects do not bind themselves to accept the lowest or any Tender.

[*For remainder of Contracts see next page.*

CONTRACTS.

TO BUILDERS. — PARISH of SAINT PANCRAS, in the County of Middlesex - DEPARTMENT of WORKS. - Notice is hereby given that the Highways Sewers, and Public Works Committee of the Vestry of the Parish of St. Pancras, will meet at the Office of the Department of Works on MONDAY, the 22nd day of SEPTEMBER instant, at FOUR o'clock in the afternoon, to receive TENDERS for BUILDING LAUNDRIES, KITCHENS, SEPARATION WARDS, and other premises, according to plans and specifications, to be seen on or after SATURDAY, the 13th SEPTEMBER at the Office of the Chief Surveyor, Edward street, Hampstead road, where bills of quantities and further particulars may be obtained. Security will be required for the due performance of the contract. The Vestry do not bind themselves to accept the lowest or any Tender. Tenders to be delivered at the office of the Department of Works, by or before TWELVE o'clock at noon, on MONDAY, 22nd day of SEPTEMBER instant. By order of

WM. BOOTH SCOTT, Clerk of the Vestry.
Department of Works, Edward street, Hampstead road.

TO BUILDERS.—LLANHILLETH.

REDBORY, MONMOUTHSHIRE.—Builders are invited to submit TENDERS for the ERECTION of a RECTORY-HOUSE, for the Parish of Llanhilleth, near Newport, Monmouthshire. The plans and specification of which may be seen, and copies obtained, on application to the Rev. JAMES HUGHES, at Crumlin, on the Western Valleys Railway, near Pontypool, on MONDAY next. Tenders to be forwarded to Mr. NORTON, Architect, 24, Old Bond-street, London, on or before the 20th inst.

NORTH-LONDON FREEHOLD LAND SOCIETY.—The DIRECTORS of the above Society are ready to receive TENDERS for MAKING ROADS, and PUTTING IN GAS-PIPES and SEWERS, upon their Estate at Enfield.—A specification and particulars may be obtained of Mr. CHARLES WILSON, Surveyor, 21, Belle Vue Villas, Islington. Tenders to be sent to Mr. JAMES BARNARD, Secretary, 6, York place, City-road, on or before TUESDAY next.

TO ENGINEERS, MECHANICS, PRINTERS, AMATEURS, AND OTHERS. — The Proprietor of PARAGON WORKS, Edinburgh, having removed from Edinburgh, purposes to have a SALE of NEW ENGINES, TOOLS, and MACHINES, to take place in the month of OCTOBER next, and which will comprise, amongst others, the following:—Steam Engines, viz.: 10-horse Slide Lathe, Planing Machine, Vertical Boring Machine, and Drills, Nut and Screw-cutting Machine, Screw-cutting Lathe, Slotting Form Planing Machine, Circular and Metal Saws, Punching Presses, Portable Steam Engines, Lathes, Drilling Machines, Excentric and Coal Cutting and Coal Breaking Apparatus, and a number of other Tools and Machines; and as nothing but first-class work, containing all the most recent improvements, is turned out of Paragon Works, the above are well worthy the attention of all parties requiring the like.—Detailed and descriptive catalogues will be sent to parties applying to the Manager of Paragon Works, near Queensferry, Midlothian, Edinburgh, by post when requested by enclosing 6d. in stamps.

N.B. Improved Steam Hammers of all sizes made at Paragon Works.

TO PLANT BROKERS and OTHERS.—

WANTED, a good second hand cast-iron WATER-TANK, in plates, to hold from 1,000 to 2,000 gallons of water.—Address by letter, to 12, Gt. Ann-st., near Gt. Hill, and JONES, Export Biscuit Bakers, Jewry-street, Aldgate.

HOT-WATER APPARATUS of the best construction, adapted for warming and ventilating hot-houses, conservatories, public buildings, &c.; cast-iron boilers, self-acting regulators, pipes, &c.; hot-air, drying, and hydraulic apparatus; portable engines; shafting and other machinery upon advantageous terms.—TAYLOR BROTHERS.

TO BUILDERS and CONTRACTORS.—

TO BE SOLD CHEAP, a quantity of proved CAST-IRON GIRDERS, from 5 feet to 20 feet long, also some malleable and cast-iron pipes, galvanized or in the bright. For further particulars, apply to H. POUNTNEY, British Iron Foundry, Blackfriars-road.

PATENT MACHINES for WORKING in WOOD. These celebrated Machines have now been in use for four months in the establishment of the Inventor, and have been visited by the Indian, American, and all the principal Governments in Europe; also by eminent Contractors, Builders, Shipwrights, Mast-makers, and others in wood, and are pronounced by all who are in every respect perfect, either in hard or soft wood, for planing, squaring up, moulding, tenoning, morticing grooving, rebating, sawing, and boring, whilst they perform it in a very rapid and superior manner, at a greatly reduced cost.—Sold only by WILLIAM PURNELL, Patentee, 20, Lant-street, Borough, from all of full particulars may be obtained, and the machines can be seen at work.

CANNON IRON FOUNDRY, 80, Goswell-street, St Lukes, J. NESBIT and BLYTON, have now in great activity, as for the last 30 years, the business in the Trade that they can now supply them with Plain and Ornamental Iron Columns, Girders, Railings, Gates, Iron Coping, Balconies, Wrought Guards, Verandahs, Trellis Panelling, Vaults, Iron Staircases, Tomb Enclosures, Trellis Panelling, Lamp and other Brackets, Cantilevers, Newel Bars, Water Closet Work, Area Grates, Eye and Pin Wheels, Weights, &c.

BAKERS' OVEN WORK, Forge Backs and Troughs, Rain Water Pipes and Gutters, Sash Weights, Furnace Bars, Stoves, Ranges, &c. always in stock.

FOUNDRY AND IRON WORKS,
65, DRURY-LANE, and CHARLES-STREET, DRURY-LANE
GLOVER, BROS.,

Solicit the attention of the Trade to their extensive Stock of PATTERNS for CASTINGS of EVERY DESCRIPTION either structural or ornamental.

Patterns of Girders, Columns, Balconies, Railing, Ornamental Carriage and Park Gates, Lamp and Street Posts, Tanks, Pipes Valves, Pistons, Lathes, and Steam Engines, Rotary or Hot plate Metal. An improved Boot Door, and other Ornamental work.

A large stock of Rain-water Pipes, Plain and O G Gutters, Air bricks, Sash Weights, Air tight Sewer Grates, Stable Fittings Hurdles, &c.

Plain and Ornamental Vases 20 per cent. cheaper than Terra-cotta.

Estimates given for Iron Buildings, Wrought-iron Roofing, Greenhouses, Staircases, Wrought-iron Girders, Fireproof Book safes and Strong Rooms, Tanks and Boilers, and every description of Ironwork as specified, and Drawings executed with every attention to quality and despatch.

GLOVERS' IRONWORKS,
168, DRURY-LANE, and CHARLES STREET

RAILS, CONTRACTORS' FLAT-BOTTOM, FOR SALE, about 100 tons, 44 lbs. to the yard, in good condition. Apply to MALTHUS and SON, 44, Cornhill, and City, Contractors for Railway Plant and Stores. A quantity of Wrought Iron Tanks, and Iron Work, suitable for Wool Warehouses. Also, an Iron Crane, 3 ton power, capable of carrying thirty feet.

LIGHTNING CONDUCTORS.—

R. S. NEWALL and CO. Patentees of the Copper Rope Lightning Conductor, supply Lightning Conductors, with the Patent and absolute safety of the copper rope, at the least possible cost. R. S. NEWALL and CO.'s Patent Copper Rope Conductor is being applied by architects, engineers, and scientific men in all parts of the kingdom.

COPPER and IRON CORD for WINDOW SASH-LINES.

PITT'S PATENT SELF-ADJUSTING DOOR FURNITURE, IN CHINA, GLASS, WOOD, &c.

First-class Prize Medal, Paris Exhibition, 1855.
Specimens at the Hardware Court, Crystal Palace, Sydenham.
Illustrated Price detailed lists post free on application

HART and SON, MALLEABLE IRON FOUNDERS, 4, Vine-street, York-road, Lambeth
Orders for Malleable Iron Castings executed within a week.

MACHINERY for SAWING, PLANING, MOULDING, &c.

SAMUEL WORSSAM and CO. beg to call the attention of Contractors, Shipbuilders, Sawyers, Turners of Saw Mills, and others, to their improved Inventions and Adaptations in Saw Frames and Benches, Rotary and Chain Planing Machines, Endless Saw Frames, and all other kinds of Machinery for Sawing, Planing, Dressing, and Working Wood. They have constructed 50 Planing machinery, either wholly or partly made, so that they can at all times on short notice supply them. S. W. and CO. beg to state that they have hitherto confined their attentions to this sort of machinery, and have had the honour of supplying some of the most distinguished engineering and shipbuilding firms interests in the world with their machines, for home and foreign use. One of their Saw Benches and also a smaller one with further Apparatus may be seen at the Machinery Department, Crystal Palace. A complete Catalogue, with Drawings, may be had on application to SAMUEL WORSSAM and CO. Engineers, &c. Kings road, Chelsea, London.

WOOD-CUTTING MACHINERY, JOHN M'DOWALL and SONS, WAGHORNSHAW (late) FOUNDRY, J. HINSTON, near Glasgow, MANUFACTURERS OF VERTICAL SAW-FRAMES (driven by steam),

For cutting balks of timber, from 5 feet on the side down to the smallest scantling.

Patent vertical saw-frames, of the foregoing dimensions, with steam-power attached, circular cross-cut radial sawing machines; patent moveable ditto; patent horizontal cross-cut sawing machines, for heavy timber; planing machines, for working boards from a ¼ of an inch thick to 6-inch deck plank; revolving planers, for squaring and shaping heavy timbers, as used by ship-builders, &c; patent curvilinear sawing machines, for circles, ovals, and irregular figures, also ample for ship-building purposes; patent 4 cutter moulding machine, moulding 4 sides at once; and double; veneer mills of all sizes, with all appendages; sole-board machines, for hat-boxes, &c.; patent silent feed motions for saw-frames; and every description of machinery for cutting and shaping timber, all constructed of iron, of the best materials, and first class workmanship. Mr M'Dowall has been in the engineering and millwright business for upwards of 30 years, but during the last 21 years he has directed his attention particularly to the manufacture of wood-cutting machinery, as evidenced by the number of patents he has obtained for its improvement, and by the extensive orders his firm has been favoured with from the British and other European Governments and private establishments in almost all parts of the world; and from their large and commodious premises, and first class plant made for every department of the work without regard to cost, the largest contracts can be executed with a regularity, accuracy, and despatch, which cannot be exceeded by any other firm in Europe.—Applications as above for further particulars, will be promptly attended to.

JOHN TANN'S NEW PATENT RELIANCE LOCK and CHEMICAL FILLED WROUGHT-IRON FIRE-PROOF SAFES, DOORS, ROOMS, &c. Manufacturers of every kind of lock, and proper boxes, embossed and copying presses, letter balances, and every description of lever locks and street door latches. To be had at the General Lock and Safe Warehouse, 30, Walbrook, City. List of prices on application.

A PRIZE MEDAL for SUPERIOR LOCKS was awarded to J. H. BOOBBYER at the Great Exhibition of 1851, who invites the attention of Builders, &c. to his Stock of Locks, Ironmongery, Brass Foundry, Nails, Screws, and cut, Copper and Zinc, Patent Locks of all descriptions; China, Glass, and Wood Furnitures of all kinds, with Patent Shifting Spindles; Dr Arnott's Ventilator, 4s.; and the new registered Venetian Ventilator, so much admired, &c. 6s. 6d. each.

J. H. BOOBBYER (late STURCH and BOOBBYER), established nearly 300 years, for the supply of Goods from the best Manufactories, at the lowest prices.
14, Stanhope-street, Clare-market, London.

CHUBB'S LOCKS, with all the recent improvements; STRONG FIRE-PROOF SAFES, CASH and DEED BOXES.—Complete lists of sizes and prices may be had on application

CHUBB and SON'S, St. Paul's churchyard, London; 28 Lord-street, Liverpool; 16, Market-street, Manchester; and Horsley-fields, Wolverhampton.

TO IRONMONGERS, BUILDERS, &c.
PATENT WROUGHT-IRON WELDED TUBE for GAS; galvanized ditto for water; high-pressure cocks, &c. Manufacturers of Dr. Arnott's Improved Ventilators. HULETT and CO., High Holborn.

MALLET'S PATENT BUCKLED PLATES.
TUPPER and CARR,
SOLE LICENSEES and MANUFACTURERS.

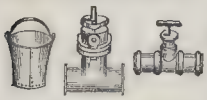
6-inch Rd. Ward Mortise, with Best Furniture and Patent Spindles, 2s. 3d. each. Light Elliptic and Register Metal, 1s. per cwt. Dr. Arnott's Ventilators, 4s. 6d. each.
Brick Moulds kept in stock. Any sizes made to order.

Best Cut Clasp and Rose Nails.				
1½ in.	1 in.	¾ in.	½ in.	⅜ in.
10s. 6d.	10s. 6d.	12s. 6d.	16s.	14s. per cwt.
Best Sheet Cut Floor Brads				14s. per cwt.
Best Cut Lath Nails				10s. "

COLLINGE'S PATENT HINGES.—
Manufacturers, CHARLES COLLINGE and CO. 64 and 65, Bridge-road, Lambeth, where a great variety are always on view for church, park, railroad, coachhouse, and other gates and doors of large and small dimensions, a ton weight moving with these hinges as easily as a wicket. Ornamental Hinges, adapted for drawing-rooms, &c.; doors fitted with them may be removed and regained in an instant. Rising and self-acting spring hinges, and superior gate fastenings, at moderate prices. None genuine unless marked "Charles Collinge, Patent, Lambeth." Plain and ornamental cast and wrought iron-work, for building and other purposes. Engines, machinery, patent axle-trees, sugar-mills, &c.

WROUGHT-IRON GIRDERS
For BRIDGES and BUILDINGS,
MANUFACTURED AND GUARANTEED AS TO STRENGTH.
CAST-IRON GIRDERS for BRIDGES and BUILDINGS.
Castings of every description.



ROLLED WROUGHT-IRON FLITCHES
For TRUSSING BETWEEN TIMBER.
SPIKES, RIVETS, CUT NAILS, WROUGHT DITTO, SCREWS, BOLTS AND NUTS, BOND HOOPS, CHAINS, &c.
CONTRACTORS' PLANT, RAILS, EARTH WAGGONS,
And IRON WORK for WOOD WAGGONS, &c.

MATTHEW T. SHAW, 64, CANNON-STREET (late with C. J. Mare & Co.)
Such arrangements are made for Despatch and Punctuality that Orders can be executed in a few days.

ZINC ROOFING, INCLUDING TIMBER OR IRON FRAMEWORK,

IS AS
CHEAP AS SLATES OR GALVANIZED IRON, LIGHTER, AND MORE DURABLE.
Certificates, and Models of various descriptions, may be seen, and estimates obtained on application to
THE SURVEYOR OF THE VIEILLE MONTAGNE ZINC MINING COMPANY, 12, MANCHESTER BUILDINGS, WESTMINSTER.
ROOFS CONSTRUCTED UNDER HIS SUPERINTENDENCE GUARANTEED TO REQUIRE NO REPAIRS FOR AT LEAST TEN YEARS.
THE OLD METAL BEING ALWAYS RETAKEN AT HALF-PRICE, RENDERS IT ADVANTAGEOUS FOR ALL TEMPORARY BUILDINGS.
Many roofs covered with zinc thirty-five years ago have never required repairs.

B. FOWLER and CO.'S
FARM and COTTAGE PUMPS, 30s

All sizes and descriptions of Pump, in various plain or ornamental patterns, for public places; for deep or shallow wells. Brass Lift Pumps, Rooms Frames, Horse Gear, Crabs, Pulley Blocks, Wrought Iron, and Bolt-in Baskets, Sewer Lamps, Sluice and Hot-Water Valves, at lowest prices.

N.B. Every attention paid to country, export, and trade orders. Experienced workmen sent to any part of the kingdom, to fix PUMP WORK, HOT-WATER, STEAM, BATH, or DRYING APPARATUS.

BENJAMIN FOWLER and CO.
FIT UP HEATING-APPARATUS OF ALL KINDS,
For Public Buildings, Private Mansions, Offices, Manufactories, and Horticultural Buildings,
And for every purpose where artificial heat is required.
They also erect DRYING-ROOMS for ASYLUMS, UNIONS, DOMESTIC and MANUFACTURING PURPOSES, on the most improved principles, and upon the largest or smallest scale.
STEAM COOKING and BATH APPARATUS FIXED;
Also PUMPS, for DEEP or SHALLOW WELLS,
To be worked by hand, horse, or steam power;

THE PATENT BOND which is prepared from the ORDINARY HOOP IRON, by notching it at intervals of 1½ inches) is now being extensively used in the best class of Country Mansions, Public Buildings, Banks, Asylums, Bridges, Viaducts, Prisons, Engine Houses, and Manufactories, as well as in other public and private Works in London and in all parts of the Kingdom.

Sole Manufacturers—THOMAS PERRY and SONS, Highfields Works, Bilston.
London Depôt—ST. ANN'S WHARF, EARL-STREET, BLACKFRIARS.

NEW PATENT INVENTIONS FOR STABLE REQUISITES.
AWARDED A PRIZE AT THE PARIS EXHIBITION, AND PATRONISED BY THE ENGLISH AND FRENCH GOVERNMENTS.

COTTAM and HALLEN, of Winsley-street,

Are the original inventors of the PATENT ENAMELLED MANGER, WATER-TROUGH, and WROUGHT IRON RACK, united to an iron top-plate, and forming one complete and useful fixture having Cottam's Patent Nosebag Hutch Gate and Chaff-Rein attached, the ball of which is taken to the back of the manger, and works with ease and freedom up or down the curb bar. Cottam's new Patent Seed-Box, of galvanized sheet iron, an important addition to the above fittings, being unique in construction, light and durable, promotes cleanliness, and is economical in its results. Also, the Patent saddle and Harness Bracket combined, which can be used with great advantage where space is an object, as it can be turned up out of the way when not in use.

Improved Harness Holders, for preserving the shape of the harness, and preventing its creasing. Patent Loose-Box Fittings, Cheap and Durable Corn-Bins.

Improved Surface-Drain, with safety covers, Sanitary Traps, and every article for the harness-room and stable, kept in stock, plain, galvanized, and enamelled. Iron Gates, Fencing, Hurdles, &c.

The new Illustrated Catalogue for 1856, and estimates gratis, upon application to

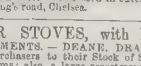
COTTAM AND HALLEN, 2, WINSLEY-STREET, OXFORD-STREET.

TO MANUFACTURING CHEMISTS, PLUMBERS, BUILDERS, &c.

ANDREW CLARK and COMPANY, PLUMBERS,
THE BEAR GARDEN LEAD WORKS, SOUTHWARK,
Sole Manufacturers of Delbruck's Patent Autogenous Soldering Apparatus, invite the attention of Manufacturing Chemists to their Patent method of
UNITING LEAD TO LEAD WITHOUT SOLDER.
Leaden Chambers, or any leaden vessels, made or repaired by this process, making them complete, without the introduction of any foreign metal.
PLUMBERS and BUILDERS can be SUPPLIED with SHEET LEAD and PIPE, cut to any dimensions, and EXCHANGED for OLD LEAD, on the LOWEST TERMS.

BATHS and HOT-WATER APPARATUS.
J. TYLOR and SONS' ILLUSTRATED CATALOGUE of BATH WORK, &c. to be had on application. Estimates and Plans for Fixing given. J. TYLOR and SONS, Manufacturers, Warwick-lane, Newgate-street, London.

DR. ARNOTT'S SMOKE-CONSUMING GRATE.
Will this Grate become universally used?
It confers advantages over every other extant in—
1. A saving of 50 per cent in fuel
2. Its being a cure for a Smoky Chimney
3. Its not requiring one half the attention of an ordinary fire.
4. Its being perfectly safe.
A Prospectus, with a Second Series of Testimonials, just issued, from all parts of the country, will be sent on application to F. EDWARDS, SON, and CO. 42, Poland-street, Oxford-street.



GURNEY'S WARMING APPARATUS,
for CHURCHES PUBLIC BUILDINGS, and PRIVATE HOUSES.—This Apparatus is a modification of that invented by Mr Goldsworthy Gurney, and now used by him for warming the House of Commons and House of Peers. It is especially adapted as the most available for private houses, churches, and other buildings. It is simple, inexpensive, and powerful. Any fuel may be used, coke, or gas combining the laws of conduction and convection of heat, to temper and warm air for respiration, without drying or reducing the natural hygrometric state. Further particulars apply to Mr. WOODCOCK, 5, Bush-lane, Cannon-street, Pimlico, who will supply the Apparatus, and is empowered to grant licences for agencies under the patent.

WARMING and VENTILATING.—ALFRED MAY begs to call the attention of Architects, Builders, and others to his system of WARMING by HOT WATER, Lunatic Asylums, Workhouses, Churches and other Public and Horticultural Buildings, Mansions, and Offices.

A. M. having had great experience in the above line, is enabled to guarantee the efficiency of such works as may be intrusted to him for execution; he has just completed, to the entire satisfaction of the architects, the warming and ventilation of the Baron's and Sir Anthony Rothschild's new mansions in Piccadilly.

Manufactory, Eagle-court, Dean-street, Holborn, and at 59, Devonshire-street, Queen's-square, Bloomsbury.

Artificial heat applies for drying linen on a very economical and effective system.

HEATING BY  HOT WATER.

JOHN WEEKS and CO. King's-road, Chelsea, HOT WATER APPARATUS MANUFACTURERS. Buildings of very large and small dimensions, and extensive conservatories, can be effectually warmed by Hot Water. JOHN WEEKS and CO. can give innumerable references of Churches, Dwelling-houses, Warehouses, &c. &c. where they have fixed their Hot Water Apparatus. Also to be seen in extensive operation at their Premises, King's-road, Chelsea.

REGISTER STOVES, with PATENTED IMPROVEMENTS.—DEANE, DRAY, and CO. invite the attention of purchasers to their Stock of STOVES for drawing and dining rooms; also, a large assortment of PATTERNS, suitable for fitting rooms, offices, bed-rooms, &c. Fenders and Fire Irons. DEANE, DRAY, and CO. are constantly introducing every novelty at the lowest prices. DEANE, DRAY, and CO. Stove, Range, and General Ironmongery Warehouse, London-bridge. Established, A.D. 1700.

FIRE-PROOF CONSTRUCTION.—FOX and BARRETT'S PATENT.
This improved system of fire-proof construction has been most extensively adopted, and its application has been extended to nearly EVERY DESCRIPTION OF BUILDING, whether public or private.
The system combines ECONOMY, with great simplicity of construction, perfect security from fire, increased durability, and many other important advantages.
The floors and roofs are formed by a combination of joists of wrought or rolled iron with concrete, so constructed that each floor becomes in effect a beam of artificial stone, with ribs of iron; the structure possessing great strength and rigidity, and forming a fire-proof foundation adapted to receive a finished surface, either of the ordinary flooring boards, or of cement, asphalte, tiles, slate, or other material.
Some of the largest and most important buildings in the kingdom are now in course of erection upon this principle, which is recommended to the notice of all who are interested in building, both as superseding the necessity for cast-iron girders and brick arches, and as bringing the great desideratum of fire-proof construction, even for ordinary dwelling-houses and domestic buildings, within the reach of every one.
Further information may be obtained of the Proprietor of the patent,—Mr. BARRETT, 12, York-buildings, Adelphi.

IRONMONGERY,
PFEIL AND STEDALL,
THE LARGEST STOCK AT
THE LOWEST PRICE,
5 AND 6, BROAD-STREET, BLOOMSBURY.

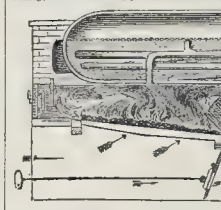
AUSTIN'S IMPERIAL
PATENT SASH and BLIND LINE can be obtained of all
ROPEMAKERS, IRONMONGERS, MERCHANTS, FACTORS, and WHOLESALE HOUSES, in TOWN or COUNTRY.
Established 1774.



JOHN WARNER and SONS, Patentees of IMPROVEMENTS in the MANUFACTURE of LARGE BELLS
J. W. & SONS having of late years devoted much time and study to the long neglected art of Bell Casting, have recently invented and patented a new process connected therewith, by which they are enabled to manufacture Bells of any size, note, or weight, of superior tone, truer in form, and at less cost than has heretofore been accomplished.

Bells for Churches, Chapels, Colleges, Schools, Turret Clocks, &c. cast for any size, note, weight, singly or in peals.
TUNED BY MACHINERY
Stocked and wheeled ready for fixing. Old Bells recast or taken in exchange
MUSICAL HAND-BELLS
tuned to the Chromatic Scale, with improved Clappers, and pegged on a new system, which give superior tone and facility for ringing.

NAILS and IRONMONGERY From BIRMINGHAM direct.
Builders, Contractors, and Others, supplied with Nails, Iron, and Ironmongery of every description, at the LOWEST BIRMINGHAM PRICES.
A complete LIST of which will be forwarded upon application to BLYTH and BIANCHI,
Nail Manufacturers and General Factors, BIRMINGHAM; or at 16, Gresham-street, LONDON.

GARDNER'S PATENT STEAM GENERATOR and SMOKE CONSUMER produces more steam with lessened consumption of fuel, and entire removal of smoke. These patented improvements are highly recommended for their simplicity, durability, and great economy. They are self-acting, have no moving parts, therefore require no external aid.

They are applicable to all Furnaces, Locomotives, Marine Engines, Ovens, Pottery and other Kilns, Common Fire, Kitchen Ranges, Hall and Hot-air Stoves. Application to be made to the PATENTEE, 21, Norfolk-street, Middlesex Hospital; to Messrs BURBIDGE and HEALY, 118 Dorset-street, Fleet-street; or to Z. D. BERRY, Albion Works, Wilton-road, Pimlico.
Testimonials, &c. may be seen upon application.

TO BUILDERS, MASONS, AND OTHERS.
THE largest STOCK in England of MARBLE in Blocks and Slabs, veined, Bardilla, dove, black, black and gold, Sienna, St. Anna's statuary, serpentine, verd antique, &c. Portland, Hareloll, Park Spring, and other stone, in blocks, slabs, landings, and headstones. Yorkshire paving, granite curb, &c. All goods carefully packed and forwarded to any part of England.—THOMAS JACKSON, Marble and Stone Sawing-Mills, Commercial-road, Pimlico, London.

LLOYD'S MARBLE WHARF, Thames-bank, Pimlico, adjoining Vauxhall-bridge.—Italian Statuary, Veined, Sicilian, Dove, Sienna, and other Marbles, for Sale, at import prices. A resident manager on the wharf at all hours.

BUILDERS! ARCHITECTS! AND MASONS!
MARBLE.—The Italian Marble Company call the particular attention of Builders, Architects, Sculptors, and Masons to their PRESENT low prices, viz :—
Vein, in blocks of ordinary dimensions, 8s. 6d per foot cube.
Sicilian " 6s. 6d.
An inspection of their well-assorted stock is solicited, at "The Depôt," Bridge-wharf, Millbank, adjoining Vauxhall-bridge.—Apply only to Mr. BAXTER, Wharf Foreman.
WILLIAM W. BONNIN, Secretary.

MARBLE CHIMNEY-PIECES.—The nobility and gentry of the United Kingdom who are building or refitting their mansions are most respectfully invited to inspect the most Extensive Collection of MARBLE CHIMNEY-PIECES lately imported from the Continent. They comprise Statuary, Giallo di Sienna, York Rouge, Dove, Black and Gold, Rouge de Belmont, Bardiglio, and other choice foreign marbles; and are designed with great taste, and executed by first class artists.—On sale in the show rooms of Messrs. EVANS, SON, and CO. King William-street, London-bridge.

RANSOME'S SILICIOUS STONE.—All kinds of ARCHITECTURAL EMBELLISHMENTS executed in this beautiful and indestructible material, at prices not exceeding the ordinary manners. Full particulars furnished on application to Mr. FRED. RANSOME, Whitehall-wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich.

BATH STONE.—HENRY STONE, having understood that some parties have been offering for sale a sort of stone, calling it Hampton Down, H. S. begs to inform Architects, Builders, and others, that he is the only person that can supply that article. Having, about two years since (at a considerable expense) reopened the well-known Hampton Down Quarries, he is happy to state that he can now supply that stone to any extent. Since opening the quarry, H. S. has supplied a considerable quantity of it to several churches and other public buildings. COMBE DOWN and BOX GROUND WEATHER STONE on the most reasonable terms. Residence, WIDCOMBE, BATH. Cargoes shipped and delivered to any part round the coast.

TO CONTRACTORS AND OTHERS.

Sawn slab and headstones in Green Moor, Harehill, Robin Hood. The best attention given to all orders, and prices sent on application—at such prices to meet the wishes of all. The nearest wharf to the City and Surrey side of the water.

CAEN and AUBIGNY STONE.—P. FOUCARD, Stone Merchant and Quarryman. Cargoes shipped to order from Caen to any port. Contracts taken for any quantities. Depôts: Granite Wharf, East Greenwich; Lett's Wharf, Waterloo-bridge. Office: 346, High-street, Southwark, near the Townhall.

GATES and GEORGE, CAEN, AUBIGNY, and GENERAL STONE MERCHANTS.
CAEN WHARF, ROTHERHITHE, LONDON.

WELSH GRANITE.—The Welsh Granite Company, Carnarvon, supplies Pitching or Paving Sets of this Material to order. The Sets, which have for several years been extensively used in Manchester, Bristol, Leeds, and other large towns, combine in a higher degree than any others, the qualities of roughness in wear and durability. The stone is also well adapted for foundation courses, plinths, &c. for public buildings and for mill-stones.

GRANITE.—King William and Nelson Monuments. Plinth and Steps of the Royal Exchange, and Terraces at the Crystal Palace.—Supplied by the Haytor Company under Royal Charter.—For terms, apply to Mr. C. HOAR, Haytor Granite Office, 4, Millbank-row, Westminster.

GRANITE.—The Cheesewring Granite Company, Liskeard, Cornwall.
London Agents—TREGELLES and TAYLOR, 54, Old Broad-street. Manager—JAS. J. TRATHAN, Liskeard
This Granite is selected for the New Westminster-bridge.

MARKET-WHARF, REGENT'S-PARK-BASIN.—WEST-END DEPOT, for Yorkshire Paving, Portland and Derby Stone, Bangor Slates, Slabs, &c. Also Bricks, Lime, Cement, Plaster, Tiles, Laths, and Fire Goods. SCOLES and WOOD invite the attention of Builders, Masons, and others, to their Stock as above, where everything will be charged at the lowest prices. Headstones, Ledgers, Steps, Landings, &c. cut on the shortest notice. Country orders promptly attended to.

STONE! STONE! STONE!—To the TRADE.—The cheapest place in London for Portland and Bath Stone, Yorkshire Landings, Steps, Curb, Paving, Self-face Slab, Granite Pitching and Curb, Guernsey broken Road Materials, and every other description of stone, at JOHN KNIGHT and SONS, Devon Wharf, Mile-end. York tooled paving, 38s. 6d. per 100 feet; slab for hearths, 4d. per foot sup.; slab for chimney-pieces, 3½d. per foot sup.; 8 by 3 window-sills, 6d. per foot run; 13 by 3 coping, 8d. per foot run; box chimneys (any opening), 8s. 6d. each. Terms cash on delivery.

JOHN BAZLEY WHITE and BROTHERS, MARBLE MERCHANTS,
MILLBANK-STREET, WESTMINSTER.

BATH STONE OF BEST QUALITY.
RANDELL and SAUNDERS, QUARRYMEN AND STONE-MERCHANTS, BATH.
List of prices at the quarries and depots, also cost for transit to any part of the kingdom, furnished on application to Bath Stone Office, Corsham, Wilts.

SLATE.—An assortment of the best BANGOR ROOFING SLATE ON SALE, at Bridge-wharf, Millbank—Apply to Mr. GEORGE BAXTER, Foreman.

VALENTIA SLATE SLABS.—The Valentia Slab Company invite attention to their Slabs now supplied, of very large dimensions and of superior quality. They have been used at the British Museum, National Gallery, Bethlem Hospital, various Lunatic Asylums, the Ordnance Works, Model Prison, Pentonville, and other Penitentiaries; Malting Floors in Bedfordshire and Hertfordshire, Breweries, the Race Stand at Brighton, Portsmouth Barracks, and are kept in stock in large quantities by Messrs. FREEMAN, Millbank-street; and at Messrs Brahw's, Belvidere-road, where terms may be obtained.

PARIS EXHIBITION.—ENAMELLED SLATE—TWO FIRST-CLASS MEDALS!—Mr. MAGNUS is the only exhibitor whose productions received this double honour; also the Prize Medal at the Great Exhibition of 1851, and the Medal of the Society of Arts in 1848. This beautiful material, handsomer and more durable than marble, is now finding its way into palaces, into the mansions of the nobility at home and abroad, into the highest class of public buildings, as well as into humbler dwellings. The cost is immeasurably below that of any other production that can in all respects compete with it. It is applicable to a variety of useful and ornamental articles, too numerous to be separately specified. Among the chief are chimney-pieces and ornamental stoves for all apartments; plain and exquisitely decorated slabs for the tops of loo-tables, chiffoniers, consoles, &c.; baths, baptistries, altar-tablets, pilasters, columns, vases, pedestals, and brackets; wash-stand tops, billiard tables, linings to halls, vestibules, and dairies.—Price lists can be had on application to Mr. MAGNUS, 39 and 40, Upper Belgrave-place, Pimlico.
N.B. Plain slate would not exhibit a single article to the most extensive contracts, for home and abroad.

SLATE.—The Bangor Royal Slate Company have now on hand a LARGE ASSORTMENT of ROOFING SLATES, blue and green, of the usual sizes, which they are prepared to supply on the usual terms, for shipment from their depôt, at Bangor, or to transmit by railway. Also Slabs of all sizes. Orders to be addressed to Mr. EDWARDS, Manager, Royal Slate Quarries, Bangor.

ASPHALTE.—GERVASE FOOTTIT TRINIDAD ASPHALTE WORKS, ROTHERHITHE, LONDON. Established 1834.—TRINIDAD, SEYSSEL, and BRITISH ASPHALTES, manufactured by Steam power, laid down in the best manner, or supplied in any quantity. Information for using forwarded gratis by material. Post-office orders or reference in London promptly attended to.—Estimates given for every kind of the above work.

ASPHALTE, FOREIGN and BRITISH, for FLAT ROOFING and every description of PAVING, especially in damp situations,
FROM 9d. PER SQUARE YARD.
Country Builders supplied with Asphalte for footings and barn floors, with instructions for using it.
Apply to JOHN PILKINGTON, Poloneeau and Limmer Asphalte Office, Monument-chambers, 14, Fish-street-hill, London.
N.B. Importer of the PURE ROCK ASPHALTE, from the LIMMER Mines in Hanover.

CROGGON and COMPANY, Manufacturers of
PATENT ASPHALTE ROOFING,
BOILER, RAILWAY, SHEATHING and INODOROUS FELT.
For Damp Walls, and Lining Iron Houses,
2, DOWGATE-HILL LONDON.

O. M'CARTHY, CARMAN, and SAND and CEMENT MERCHANT, Whitefriars Wharf, Whitefriars, Fleet-street, City. Sand, from above or below bridge, delivered by the yard or per barge. Ballast screened or unscreened, by the yard or per barge. Stocks, lime, and old bricks. Dry rubbish delivered per barge, in any quantity, alongside the Thames.

NOTICE TO ROAD CONTRACTORS, NURSERYMEN, AND OTHERS.
W. and J. STUDDS, Sole Proprietors of the WEST DRAYTON GRAVEL PITS, lately removed from No. 21 Wharf, Harrow-road, to 2, North Wharf-road, Paddington, have now on sale good Garden and Screened Gravel. For terms, &c. apply at the Wharf.
Contractors supplied to any extent.

FACING FOR BUILDINGS COMPANY—TAYLOR'S PATENT.

BUILDINGS PERFECTLY RESISTANT TO WET WITHOUT ADDITIONAL EXPENSE, OR THE USE OF COMPO,
REQUIRING THE CONSTANT EXPENSE OF PAINTING. EXTERNAL WALLS FACED WITH AN INDESTRUCTIBLE MATERIAL.
STONE-FACED BUILDINGS AT LITTLE MORE COST THAN CEMENT.

No necessity for Iron Cramps and Bond-stones, and the Stone Ashlar never injuriously weighted by the settlement of the Mortar-joints of the inside Brickwork. The INSIDE of CHURCHES and OTHER BUILDINGS FACED WITH STONE instead of Plastering. Also Dining halls, Lobbies, Staircases, &c of Private Residences It can be had ready for fixing from the quarries at a small cost for carriage, or prepared at home. Can be used with the ordinary Bricks of any locality, and by the ordinary workman. The CHURCH faced inside and outside in this manner, and the other Buildings at SPRING GROVE HOUNSLOW, and elsewhere, can be inspected, and all particulars obtained, of

Mr. JOHN TAYLOR, ARCHITECT, OFFICES OF THE COMPANY, 40, KING-STREET, CORNER OF CHEAPSIDE.

TO ARCHITECTS, BUILDERS, CONTRACTORS, AND OTHER CONSUMERS OF GLASS.

HARTLEY'S PATENT ROUGH PLATE GLASS,

1-8th of an inch thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th or 4 lbs. is now universally used for

RIDGE AND FURROW ROOFS, GREENHOUSES, RAILWAY STATIONS, MILLS, MARKET HALLS, BATHS AND WASH-HOUSES, FACTORIES, WORKSHOPS, SHIP-BUILDING SHEDS, AND OTHER EXTENSIVE BUILDINGS.

By a carefully prepared Estimate, it has been ascertained that FOUR-FIFTHS of the ROUGH PLATE, or non-transparent Glass, consumed in the United Kingdom in 1854, was manufactured by HARTLEY'S PATENT—thus affording the most incontestable evidence of its superiority over every other article of the kind, and as being the only description of Glass suitable for the purposes above named. It combines size and strength with economy of cost, and is manufactured in sizes expressly for RIDGE and FURROW ROOFS, giving a SPAN of TWELVE FEET, at a price not exceeding, weight for weight, that of Common Crown Glass. Its non-transparency renders BLINDS UNNECESSARY, and no scorching occurs in Greenhouses glazed with it; hence the preference given to this Glass for all Horticultural purposes.

For further particulars, apply to

JAMES HARTLEY AND CO. SUNDERLAND; AND PURFLEET WHARF, EARL-STREET, BLACKFRIARS, LONDON.

Sole Manufacturers of Lockhead's Patent Perforated Glass for Ventilation.

*** *Hartley and Co.'s Glass Tariff Newspaper will be forwarded gratis, on application.*

GRAINING by MACHINERY.—The present system of graining is far surpassed by the use of BELLAMY'S PATENT GRAINING MACHINES, by which an ordinary workman can produce first-class work, and at an immense saving of time. The designs are perfect imitations of the choicest specimens of fancy woods and patterns of the first artists. The Patent Graining Company are now prepared with a large and well assorted stock of instruments, which they offer to grainers, painters, builders, and others without royalty.

Grained paper in imitation of all kinds of fancy woods of the choicest descriptions, in the piece, or in sets for panels, &c. wholesale and for exportation. Pattern-boards and cards for the trade in great variety.

Painters, Grainers, Decorators, Merchants, and others are respectfully invited to inspect the patterns, and see the process at the Company's offices, 30, Minories, London.

A SUBSTITUTE FOR PAINT, AND AT HALF THE COST.

STEPHENS' DYES or STAINS for WOOD. The following extract from a letter the Proprietor has obtained leave to make public:—"Northgate, Colchester, Feb. 5, 1855.—Sir,—I have just finished a new church with your Oak Stain, and I consider it the best adapted for the purpose, being the nearest approach to the real wood of any I have ever used.—I am, sir, your obedient servant,

"SAMUEL GRIMES, Builder.

"To Mr. Henry Stephens, 54, Stamford-street, London."

Samples and prospectuses free to any part of the kingdom.

TO PAINTERS, BUILDERS, &c.—LIVETT, FRANK, and SON, No. 14, Borough, London-bridge, opposite the Brighton and South-Eastern Railway Stations, quote their present prices for cash—Linseed oil, 3s. 5d.; boiled, 3s. 8d.; pale pale, 4s. 3d.; oak varnish, 7s. 6d. per gallon; genuine white lead, 38s.; seconds, ditto, 31s.; best town glass, 28s. per cwt.; colours, brushes, &c. equally low. Lists of prices on application.

TO FRENCH POLISHERS, CABINET-MAKERS, BRASS-WORKERS, &c.—A considerable reduction has taken place in the prices of French polish, white and brown hard spirit varnishes, spirit lackers, and finishing spirit. The present price is 6s. to 6s. 6d. per gallon; white French polish, 10s. per gallon; white shellac, 1s. 8d. per lb.; gums, shellacs, and acid at the lowest prices. A net cash list forwarded on application to JAMES SLIPPER, 97, Leather-lane; and 14 and 15, Dorrington-street, Holborn, London.

TO BUILDERS, HOUSE-PAINTERS, and CONSUMERS of PAINT.—The GRAFTON MINERAL PAINT. This is the most durable paint hitherto known. It has been used during the last four years in the United States with great success. It is there affirmed to be unrivalled. After it has been applied to wood, and exposed to the weather a few months, it becomes as durable as stone. Wherever it is applied, neither rain nor sea-water can penetrate. The colour of the Grafton Paint is a reddish brown, but a variety of durable colours may be made by mixing it with other paints. In proportion to the quantity of any other paint mixed with it, will be the loss of its own peculiar properties. It may, however, be mixed advantageously with an equal quantity. The colour produced by this mixture will be far more durable than that of other paint. It is used on buildings of wood or brick, on iron bridges, iron railings, gasometers, and iron-work in general. Also, on fences, gates, waggons, railway-trucks, &c. For priming under any paint it is unequalled. 25 lbs. of this paint will cover 100 square yards of brickwork, or 170 of wood or iron. The Grafton Paint being finely ground does not require to be ground again. It is easily spread out, and does not emit any unhealthy effluvium.

TESTIMONIAL.

"I have analyzed the Grafton Mineral Paint, and find it to consist of silica, alumina, and peroxide of iron. These indestructible ingredients are in such a state of chemical combination that they are unaffected by heat, cold, rain, or sea-water.

"WM BASTICK, Analytical Chemist.

"2, Brook street, Grosvenor-square, London."

Sold by LIVETT, FRANK, and SON, Oil-Merchants, 14, Borough, London-bridge; of whom may be had testimonials in its favour, and also directions for use.

Price 20s. per cwt.

Sole Consignee for the United Kingdom,
JOHN EIVES, 61, King William-street, City.

WOLSTON'S TORBAY IRON-PAINTS, warranted to stand the action of the Atmosphere, Steam, Gases, Noxious Vapours, Damps, and Salt Water; also intense heat without blistering. These Paints have been tested for five years in Her Majesty's Dockyards, and two Official Reports made thereon, which testify that 62lbs of Wolston's Torbay Iron-Paint will effectually cover as much surface as 112lbs. of either White or Red Lead and Best Boiled Oil, under the same atmospheric action better than Lead Paints. For all Public Works, Galvanized and other Iron Roofing, Fencing, Shipping purposes (Wood or Iron), Stucco and Cement Fronts, economy and durability will be secured. To Builders and Painters, for all priming purposes, the saving will be immense. Manufactured at the TORBAY IRON-PAINT and ORE WORKS, Brixham, Devon; Paignton Depôt, Chamberlain's Wharf. Letters or orders addressed to Mr. WOLSTON, at the Works, or No. 34, John-street, Bedford-row, will have immediate attention.

KENT'S PAINTING-BRUSHES are of the very best quality, and may be obtained at all the first houses in the trade, and of the manufacturers, G. B. KENT and CO 11, Great Marlborough-street, London. Established 1777.

N.B. Kent's Painting Brushes are all stamped G. B. KENT & CO.

Price Lists forwarded by post.

BUILDER'S BUSINESS for DISPOSAL. TO BE DISPOSED OF, by order of the Executors, an old-established BUSINESS, with a first-rate connection, situate in a small country town about thirty miles from London. The works executed by the late proprietor have gained for the concern a high reputation; they have included the erection and restoration of several churches and others, both of a substantial and ornamental character. The premises are very complete in their arrangements: the rent nominal, and the stock well selected. The amount required will be from 1,200l. to 1,500l. There are several advantageous contracts in hand, which will be included in the purchase. The business has been conducted by the late proprietor and his ancestors for more than half a century, and a practical man of business a more favourable opportunity can rarely be met with.—For further particulars, apply to Messrs. FULLER and HORSEY, Bulhter-street, City.

TO CARPENTERS and BUILDERS.—A BUSINESS, as above, TO BE DISPOSED OF, a few miles from the City, East-end. For stock, implements, &c. together with some leasehold property, price 400 guineas; part of which can remain unpaid, if preferred. As principals only will be treated with, and business the intention of the proprietor, it is requested that no others will apply.—Direct, with address in full, to G A. Office of "The Builder."

MANUFACTURING BUSINESS, South-west of England.—The present returns are over 1,000l. per annum, at 25 per cent. profit; it is easily carried on, and the proprietor, who is retiring, from advancing age, will fully instruct his successor. About 2,000l. capital required, but it is capable of extension to a very great extent. Cards at Mr. W. H. JOHNSON'S Transfer Offices, 73, Connaught-terrace, Hyde-park, and 17, Camomile-street, City.

WINDOW BLINDS.—TYLOR & PACE, Window Blind Manufacturers, 104, New Bond-street, and 3, Queen-street, Cheapside, London, submit the following PRICES of WINDOW BLINDS, which they can recommend as being made in the best manner:—Venetian blinds, per square foot, 9d.; best holland blinds, on rollers, 6d.; best ditto, on spring rollers, 9d.; gauze wire blinds, in mahogany frames, 2s.; perforated zinc blinds, in ditto, 1s. 10d.; outside blinds of striped cloth, 2s. Transparent blinds in great variety. Engravings, with prices and discounts to builders and the trade, forwarded on application post free.

FOR HIRE, a SPACIOUS TENT, adapted for the Laying of Foundation Stones for Public Buildings, &c.

Also, for Sale, a Quantity of Cocoa Matting for Churches, at greatly reduced prices.

Apply to H. PIGGOTT, 113, Fore-street, City.

NEW WINDSOR ESTATE. — Valuable BUILDING LAND TO BE LET, in Plots for first and second class Villa Residences, with Stabling, which are much needed in this improving locality. The situation is the finest in or near Windsor, abutting on the Park and Long Walk, and commanding a splendid view of the Castle. Within ten minutes of the Great Western and fifteen minutes' walk of the South-Western Railway Stations. Any person can be had by responsible parties. For particulars apply to Mr WILLIAMSIM, Architect and Surveyor, 2, Danes-Inn, Strand.

BUILDING LAND, Wanstead-park, Essex. TO BE LET, on Building Leases, for long terms, several PLOTS of highly desirable LAND for villas and other residences in the above park. The land is situate in the immediate neighbourhood of Wanstead and Leytonstone Railway stations, now in full operation. Plans of the property may be seen, and all particulars and terms may be learned, on and after the 10th inst. on the Premises, Archie Lodge, No 5, Gresham House, Broad-street.

FREEHOLD LAND TO BE LET, on Building Lease for ninety-nine years. Money advanced to responsible parties. Freehold Land to be SOLD for building purposes in eligible situations.—Apply at the Offices of Messrs. MORGAN and PHIPSON, Architects, 5, Danes-Inn, St. Clement's Strand.

FINCHLEY.—LAND fronting the Regent's Park road, and East-end-road, TO BE LET on Building Leases for ninety nine years, with power of enfranchisement. Plots from one to four acres for large villa residences; smaller plots for semi-detached houses, and plots for shops in the village. Apply to W. A. LOVELL, Esq. Architect, 6, Waterloo place, Pall mall, or to Messrs. BARKER, BOWKER, and PEAKE, 1, Gray's-inn square.

DUNSTABLE, BEDS.—TO BE LET, ELIGIBLE BUSINESS PREMISES with ample Domestic Apartments attached, situate in the High-street, Dunstable, having a frontage of 30 feet, by a depth of 134 feet. The warehouses and Shops which have been erected within the last few years are commodious, and will improve every person's trade. The Premises are now in the occupation of Mr WILLIAM C. REED, Architect and Surveyor, 64, Old Broad-street, London.

PERPETUAL INVESTMENT, LAND, and BUILDING SOCIETY.—Shares issued, 13,630. Invested on Real Securities, £ 1,000. Money ready for free red on Deposit or Shares, interest paid half yearly. Money ready for advances on houses or lands. No fee charged to Borrowers. Apply for particulars to the Secretary, Mr J. E. T. REDDER, at the Head Offices, 37, New Bridge-street, London.

TO BE LET, in LIMEHOUSE, extensive WATERSIDE PREMISES, with Lanting Crane, &c. in good repair.—Apply to E. ROBINSON, 9, Church-row, Limehouse.

BUILDING LAND, WOODFORD, within five minutes' walk of the Church and George-lane Railway Station, and only 4 miles from the City. To BE LET on Building Leases, desirable BUILDING LAND, comprising about 7 acres, with Villa Residences, being part of Lodge Estate, Woodford.—Apply to Mr. WASHINGTON SINGLE, the Grove, Woodford; or to Mr. G. R. NOBLE, Surveyor, &c. Woodford, Essex. (Notice withdrawn if not let.)

FREEHOLD BUILDING LAND between Aldershott permanent Barracks and Farnham, and in the Government Land, half a mile from the Queen's Pavilion, and having two frontages with most extensive views. Sand, gravel, and building stone upon the estate. Eleven acres, together or in portions. Apply to Mr W. A. BIRCH, Architect and Surveyor, Farnham, and 16, Essex-street, Strand.

TO BUILDERS.—TO BE LET or SOLD, a desirable FREEHOLD FRONTAGE, in a main road near the Vauxhall Station, suitable for the erection of three or four third-rate houses. Money would be advanced to a responsible party.—Apply to Mr. R. GIBBS, No. 9, Brommell's road, Clapham.

TO BUILDERS, CONTRACTORS, and OTHERS.—TO BE LET on Lease, for a long term, several Plots of FREEHOLD GROUND, well suited for manufactories, warehouses, or other building purposes. The property is within three miles from the Mansion House, and but a little further. Apply to Mr. W. H. DEAN, Surveyor, Straff rd; or to Mr. GEORGE POWNALL, Surveyor, No. 37, Bloomsbury-square, London.

BUILDING LAND TO LET, at Peckham and the Old Kent-road, near the Licensed Victuallers' Asylum, for the erection of small houses that are in great demand. Money advanced.—Apply to Mr. ARTHUR TAYLOR, Surveyor, 15, Bassishall street.

BUILDING LAND.—TO BE LET, for 99 years, in Plots, at 1s. 6d per foot frontage, directly from the freeholder, on very advantageous terms, a large extent of most eligible FRONTAGE, suitable for small houses, close to Forest Gate Station, Stratford, Essex, four miles from the City. Also, at from 1s. 3d. to 1s. 6d per foot frontage, numerous beautiful plots, 200 feet deep, near the Carshalton Station of the Croydon Line, eleven miles from London, particularly suitable for large or small villas. Leases granted at once. No law charges. Apply to Mr. PARSONS, 7, Union-court, Old Broad street, City.

BUILDING and BRICK-EARTH LAND at Holloway, TO BE SOLD or LET, in large or small quantities.—Apply to Mr. PEACHEY, 17, Salisbury-square, Fleet-street, London.

COUNTY of SURREY. — TO LET, unfurnished, or TO BE SOLD, at ground-rents, substantially built and well finished HOUSES, on an elevated situation and gravelly soil, in the most beautiful part of the County of Surrey, and commanding an extensive view of the surrounding country. They contain seven servants' rooms, first and second-pair rooms, two dressing rooms, drawing-room, dining-room, and study. Capital kitchen, housekeeper's-room, butler's pantry, coach-house, three-stalled stable, with rooms over, and other convenient offices. For further particulars and cards to view apply to Messrs. ROBINSON and ROBSON, Agents, &c. 28, Margaret-street, Cavendish square.

GREAT GRIMSBY, LINCOLNSHIRE.—BUILDING LAND.—TO BE LET on lease, on advantageous terms, very eligible SITES, for the erection of Villa Residences, and first-class houses. The situation is excellent, being on rising ground, commanding a fine view of the surrounding country, and is close to the Town.—Plans, Carpenter's, and particulars obtained, on application to C. AINSLIE, Architect, 16, Old Jewry-chambers, City.

SOUTH HACKNEY, near LONDON.—TO BE LET, neatly finished, SIX-ROOM HOUSES, at a moderate rent, pleasantly situated within a few minutes walk of Victoria-park and the North London Railway, leading to Fenchurch-street, City.—Enquire of J. POWER, Carpenter, House Agent, &c. 7, Bentham-road, Well street, South Hackney.

SEVERAL ACRES of FREEHOLD BUILDING LAND TO BE LET (in large or small lots) with liberty to make bricks, situate at Plumstead, where small houses are in great demand. Also, Plots for Detached Villas on Shooter's-hill. Apply to Mr JOHN COLLIER, Surveyor, No. 7, Clement's-lane, Lombard street.

TO BUILDERS and OTHERS.—FREEHOLD BUILDING-GROUND in KENTISH TOWN.—The Directors of the Hampstead Junction Railway, having now taken that portion of the property belonging to the "Governesses' Benevolent Institution" through which their line passes, the Committee of this Institution are prepared to LET, on Building Leases, for a long term of years, the whole of their FRONTAGE next Grafton road. Application to be made to T. H. WYATT Esq. 77, Great Russell street, who will treat for the whole plot, or for ground for single houses.

GROUND TO BE LET, near Plumstead-common, for building purposes, at 2s. per foot; depth 100 feet. Also a first-rate plot for a public-house and tea gardens, commanding view of the river and the country; lease, ninety-nine years. Also, a six-roomed house for sale.—Apply to Mr. BROWN, at the Orchard, Cage-lane, Plumstead, Kent.

BRIDGE AVENUE, adjoining the Suspension-bridge, Hammersmith.—FOR SALE (together or separately), EIGHT remarkably well built NINE-ROOMED CARCASES, in a forward state, pleasantly situate, and distinguished as Nos. 5 to 12 inclusive, Bridge-avenue, Hammersmith, drained into the main sewer, and supplied by the West Middlesex Water-works. Land-tax redeemed: Term, ninety years; ground-rent, 5l. 5s. each house. The purchase-money for the whole of the above-mentioned property, or for each house, may remain on mortgage, if desired, for a period of five years, at five per cent. May be viewed on application to Mr. ARTER 2, Bridge-avenue; and particulars and terms obtained of Mr. JOHN PERRY, Surveyor, 143, Sloane-street, and at Mr. MARSH's offices, 3, Charlotte-row, Mansion-house, London.

CHESTERFIELD, DERBYSHIRE. — To IRONFOUNDERS, MILLWRIGHTS, and OTHERS.—TO BE SOLD by PRIVATE CONTRACT, with immediate possession, the PREMISES, known as the Griffin Foundry, situate close to the town of Chesterfield, and comprising a large moulding shops, with fitting, modelling, and smith's shops; store-loft, brass-foundry, &c. Also, a comfortable residence for a foreman, spacious yard, counting-house, and other conveniences; the whole containing an area of nine rods or more. There is water power upon the premises adequate for the above works during a great part of the year, and they are in the immediate neighbourhood of coal and railway coal. For further particulars apply to Mr W. MACHEN, Manager, Gas Works, Chesterfield; or to Messrs. SHIPTON and HALLEWELL, Solicitors, of the same place.

Chesterfield, Sept. 9, 1856.

A BARGAIN.—USEFUL LOT of IRONMONGERY TO BE SOLD, for 30l. cost 48l. DURABILITY of GUTTA PERCHA TUBING.—Many inquiries having been made as to the Durability of Gutta Percha Tubing, the Gutta Percha Company have pleasure in giving publicity to the following letter:—FROM SIR RAYMOND JARVIS, Bart., VENTNOR, ISLE of WIGHT.—"Second Testimonial, March 10th, 1853. In reply to your letter, received this morning, respecting the Gutta Percha Tubing for Pump Service, I can state, with much satisfaction, it answers perfectly. Many Builders, and other persons, have lately examined it, and there is not the least apparent difference since the first laying down, now several years, and I am informed that it is to be adopted generally in the houses that are being erected here."
N.B. From this Testimonial it will be seen that the CORROSIVE WATER of the ISLE of WIGHT has no effect on Gutta Percha Tubing.
THE GUTTA PERCHA COMPANY, PATENTEES, 18, WHARF-ROAD, CITY-ROAD, LONDON.

HANCOCK'S PATENT VULCANIZED INDIA-RUBBER TUBING, HOSE-PIPES, WASHERS, ENGINE-PACKING, both round and flat, and SOCKET-RINGS, for Hot-water pipes. These Schools will re-open on the 1st of October.
The Normal Training School for Masters will be hereafter conducted at Kensington, where public classes for male and female pupils in advanced studies are also conducted.
Localities wishing to establish schools, or public schools to receive instruction, may ascertain the terms on which aid is given by the Department of Science and Art, by letter addressed to the Secretary, at the Offices of the Department, Cromwell-road, Kensington gore South, London W.
NORMAN MACLEOD, Registrar.

The Builder.

VOL. XIV.—No. 710.

LITTLE SWAN-ALLEY, where fell the house that proved a grave for four poor creatures last week, is a few paces out of the fine thoroughfare Moorgate-street, and a very short distance from the region of gold, Lothbury. The alley is about *seven feet* wide, with houses on both sides, all in a miserable condition, dangerous alike in a structural and a sanitary point of view. The house that fell was at the back of the houses on the north side of the alley. It was a mere heap of rubbish. The tenants were advised at different times to leave it, but, as one of them said at the inquest, in words we have often recorded before, she would gladly have done so if she could; but she had a large family, and it was very difficult to get reasonable lodgings in the neighbourhood, and so she would take the chance. Mr. Woodthorpe, the district surveyor, said, in the course of his examination at the inquest,—

"The house that has fallen was upwards of 200 years old. The woodwork was perfectly rotten in every part. I have examined the house since the occurrence, and from my judgment, having seen a great deal of dilapidated property, I think that the house fell bodily from a decay of the joists and ends of the rafters. That remark would apply to the whole of the woodwork, without exception, as it was all worm-eaten. My own opinion is, that the cause of the fall was the weight of the people in the house at the time, which had then got up to a breaking-point. The floor was unable to bear the weight. The appearance of the house externally would not indicate its rotten appearance within. I have no knowledge of any formal complaint being given at my office in respect to this property. This property had been presented by the ward inquest as unsafe ten or twelve years ago. That was before my appointment; but although the presentment was made to the Court of Aldermen by the inquest, I can trace it no further. It does not appear to have been communicated to the surveyor. I have heard that the premises were afterwards repaired. He had examined three other houses, and found the same cause of decay, and he believed they would be condemned that very day. There was no foundation whatever for the chimney-shaft:—the chimney-shafts were completely suspended. Excavations frequently were made for the purpose of deepening cellars, and the footings of the walls were often destroyed. These alterations took place surreptitiously, and without notice being given to the district surveyor. Three weeks ago, when I looked at these houses, I saw nothing special to call for interference in respect to them. I do not consider it my duty to go over the district like a policeman every day. I have condemned twenty houses within the last six months in the neighbourhood of Golden-lane on my own authority. I was set in motion on notice being given to me, and on making farther inquiries I ordered the houses to be pulled down."

The coroner, after summing up the evidence that had been given, pointed out that it was the duty of the jury to inquire if there had been that culpable neglect on the part of any persons which would make them criminally responsible; whether there had been omission amounting to culpable neglect on the part of those who had charge of surveying the district, or of any other person. If they were of that opinion, they must say who were to blame, and it would be their duty to return a verdict of manslaughter against him or them; or, if they did not feel justified in coming to that conclusion, then they must say it was an accidental occurrence.

The jury, after deliberating for some time, returned the following verdict:—"Accidental death from suffocation by the falling of the house, No. 9, Little Swan-alley," accompanied by the following recommendation:—"The jury earnestly recommend to the Commissioners of Sewers that they would authorize a special survey forthwith to be made of all the buildings, in the city of London, that from age or other cause may be supposed to be out of substantial repair."

It is to be hoped that this recommendation will be attended to immediately, as there are houses around the site of the recent accident, without going farther, in an imminently dangerous state. There are houses in Blue-Hart-court and Bell-alley (we would especially instance No. 4, in the latter place, that looks as if it might come down at any moment), which should have immediate attention. In New-court, although more decent in aspect externally, the fronts overhang very considerably. In a sanitary point of view, air and light are sadly needed in this nest of alleys. We can remember when it was much worse, it is true,—when the tenants had no water, and every house was a reeking fever-still. It is bad enough, however, even now. In one of the houses that we entered, the smell was perfectly overpowering, and in many, the cadaverous aspect of the occupants shows the degradation of the vital powers. Let us hope that out of evil may come good.

Considerable misapprehension was evinced at the inquest, as to the duties of district surveyors in respect of ruinous buildings, and has since been shown out of doors, leading to very injurious reflections on the conduct of a body of public officers, wholly unfounded. The Metropolitan Building Act sets forth, in section 69, that whenever it is made known to the Commissioners of Sewers of the City of London, if situated in the City, or to the Commissioners of Police, if situated elsewhere, that any structure or projection is in a dangerous state, the commissioners "shall require a survey of such structure, to be made by the district surveyor, or by *some other competent surveyor;* and it shall also be the duty of the district surveyor to make known to the said commissioners any information *he may receive* with respect to any structure being in such state as aforesaid." Upon receipt of the surveyor's certificate, the commissioners are to act. The City Commissioners of Sewers have, wisely and honourably, as it seems to us, continued to employ the district surveyors in such matters; but the Police Commissioners have thought it right to take them wholly out of the hands of the district surveyors, and employ a surveyor of their own, so that the body of district surveyors have in truth nothing whatever to do with ruinous buildings beyond forwarding to the commissioners any information they may receive in respect of such, and this they do constantly without fee or advantage. They are, not simply, not called upon to move farther in such matters, but they have no power to do so, and would lay themselves open to animadversions if they attempted it. It is surprising, therefore, and to be regretted that a respectable journalist should reproach the district surveyors, for treating with *sang froid* what he terms their most important duties, in the discharge of which, he continues, they ought to be wakeful and active, when no such duties devolve upon them.

Again, a correspondent of the *Morning Advertiser*, who signs himself "A Practical Builder," but who scarcely can be so, says,—"It is not to be expected that the surveyor will visit and inspect the interior of every house that may appear to him to be in a dilapidated condition, unless the outward appearances shall warrant him, in his cursory view, that something is radically dangerous."

It certainly is not to be expected that he should do so: in the first place, he would have no right to do it, as we have already shown, and would simply render himself liable to a reproof for his pains. The writer goes on to say,—"And even then" (that is, if led to visit the interior of the house), "his education and avocation *does* not lead him to investigate and examine into the minute details which are requisite; and the remedy I beg to suggest is very simple, and attended with little expense, viz." (What do our readers think?), "that every surveyor shall have attached to him a practical builder of experience, who can take notice of all these defects, report to the surveyor, who can then make his report to the proper office, and thus prevent a recurrence of this dreadful catastrophe."

If the writer were really a practical builder, he would know that if any one of the surveyors be unable of himself to detect, on survey, if a building be dangerous or not, he is unfit for his office. Again, however, let us seek to make it understood, that the district surveyors, with the exception of the four in the City, are not permitted to have anything whatever to do with ruinous buildings: the Commissioners of Police have taken them altogether out of their hands.

The same correspondent, in a subsequent letter, in which he gives a list of buildings in a dangerous state, completes the evidence of either his ignorance of the matter as regards the surveyor, or wilful departure from the truth, to injure a public officer, by asking why the Corporation permit such flagrant abuses to exist, "and quietly allow the surveyor to receive his salary without efficiently performing the duties of his office?" The surveyors receive no salary, but they would be paid a small fee for each survey if they were directed to make it.

The City Commissioners of Sewers, at a meeting held on the 9th, came to the resolution, on the motion of Mr. T. Abraham, "That it be referred to the General Purposes Committee to inquire into the cause of the falling of the house in Little Swan-alley, and into the working of the present system of house inspection, with especial reference to dangerous structures, and also whether it is necessary to make any and what alteration of system, and to report thereon to this commission."

One of the speakers, Deputy Lott, in supporting the motion, said he most heartily wished that more uniformity of action would be adopted for the future than had recently prevailed among the district surveyors of the City, and he trusted that the committee would take into consideration the provisions of the last Building Act, which were of a very peremptory description. As an instance of the want of unity among the district surveyors, he might mention that some of them were very diligent—he might almost say precocious—in condemning houses, and others of a totally different turn. A case occurred in his own ward, in which the district surveyor condemned the front wall of a house, and, upon the opinion of another surveyor being obtained that the wall was not at all in danger, the matter was compromised by removing a portion of it.

If the surveyor, when appointed to survey, be too fast, he may bring ruin on an individual by unnecessary condemnation; if too slow, an accident may occur and lives be lost.

The *Times*, in a leading article induced by the accident in question (wherein it is right to say the error of attributing blame to the district surveyors is not fallen into), says:—"But while the Commissioners of Sewers must bear their own share of blame in this matter, others also are in fault, and there is not a more pointed satire on London architecture than the fact that the house in question has fallen after only 200 years." And then we find at the close of the article that these "others" are our architects:

"until our architects," says the writer, "rejoice in their materials and know how to use them, we can have little expectation of their building houses that are to last." Now, as to the house having fallen after only 200 years,—where will be the majority of the houses recently built and now building in the metropolis and suburbs at the expiration of that time? Where will they be in fifty years? No where. Hundreds of houses are being erected at this moment with rotten bricks, bad mortar, and bad workmanship, which in twenty years will be ruinous structures.

But what control have "architects" over these? None. These houses are erected to *sell*; and the problem sought to be solved by the builders of them is, how to comply with the Building Act and to make them stand with the least possible outlay. Even when an architect has to overlook them on the part of the landowner, all that he can do usually is to see that the *minimum* is not passed. The fault does not rest with "our architects."

On the day following the very sad occurrence we have referred to, an accident happened at the new Wellington Barracks in James-street, Buckingham-gate, now in progress by Messrs. Dales, builders, under Captain Grant, and Mr. Roberts as head clerk of the works. The daily papers have made the particulars known, although not quite correctly. The stone core for the top cornice had been put on ready to receive the brickwork of the blocking or parapet above, and was about to be secured by iron cramps to the brickwork below, when several of the men being around a pot-boy to get their beer, one of them stood upon the projecting core and brought a part of it over. About 20 feet of the core, some of the brickwork, and six men with it fell on to the scaffold, and then to the ground with great violence, when one man was unfortunately killed and the others were much injured. The top stones lay 1 foot 7 inches on the wall, and projected 1 foot 7 inches: the under stones were 1 foot 7 inches on the wall, and projected 1 foot 3 inches. The foreman was away seeing after the missing cramps. After evidence had been heard, the verdict was, "That the death of Thomas Conner was occasioned by a portion of the cornice falling on him, but had the iron cramps directed to be used by the specification been applied as the building progressed, the accident would have been prevented."

Some importance was attached to the fact that the scaffolding was not formed with putlogs of the usual character, but of sawn quartering, about 4 inches square, and was much wider than usual, namely, about 7 feet, and it was urged by one witness who came forward, that if this had not been the case, the weight that fell, about ten tons, would not have broken through the putlogs. This, however, is doubtful. The scaffold was certainly weaker than an ordinary scaffold: the increased width had been enforced by the necessity of fixing it at the bottom clear of the gas and water pipes which supply the Palace; but it is doubtful if a narrower scaffold would have withstood the concussion. The mass reached the ground with such force that it drove in an 18-inch area wall built in cement six months ago.

This is unfortunately not the first fatal accident that has occurred at these barracks in a similar manner, and should induce care, not merely there, but in all building operations.

District of Newington and Lambeth. — A vacancy in the office of surveyor to the district of Newington, and the central division of Lambeth, under the Metropolitan Building Act, has been caused by the death of Mr. George Porter, which unfortunately took place a few days ago.

Roman Remains in Shropshire.—An interesting discovery, it is said, has just been made of the remains of a Roman villa, on the property of the Rev. T. F. More, of Linley-hall, Shropshire.

THE BRITISH ARCHÆOLOGICAL ASSOCIATION IN SOMERSET.

Our notice last week brought up the proceedings to the end of the third day: we must pass more rapidly over the events which followed. On Thursday, 28th August, the members proceeded to visit in succession Clevedon Church, Walton Castle and Church, Walton-in-Gordano Church, Canenor Court, Clapton-in-Gordano Church, Cadbury Camp, Tickenham Church, and Clevedon Court.

Walton Church is a solitary ruin. Walton Castle is situated on a lofty hill, commanding a beautiful view. The ruins consist of an octagonal wall, with a tower at each angle, and, in the area thus formed, of an octagonal keep with a tower at one angle. Cadbury Camp, a Roman fortification, is formed by two ramparts made of loose stones. It occupies a commanding point, overlooking the Vale of Nailsea on one side, and of Portbury on the other. Clevedon Court, the seat of Sir A. H. Elton, dates from the reign of Edward III. but was restored in the time of Elizabeth, and has since received many alterations and additions. An evening meeting was held in Bridgwater, and then the next day the members took their departure for Bath, where they were kindly welcomed. The business here was opened by Dr. Markland, who read a very elaborate and elegant address on

Bath and its History.

We must take a few paragraphs. Bath, said the reader—"When compared with some other English towns, possesses but few attractions to the antiquary: still, if he has an eye for whatever is picturesque, the stranger must be struck with a city of great beauty, placed in a country of almost unrivalled loveliness. Speaking of the city itself, Macaulay says, 'It charms even eyes familiar with the masterpieces of Bramante and Palladio.'

The reign of Queen Elizabeth was a marked era in Bath as elsewhere. She visited Sir John Harington, a favourite godson (the translator of the 'Orlando Furioso'), at his mansion at Kelweston (Kelston now pronounced), in 1590. Sir John had employed an Italian artist, Barozzi, to design for him this mansion, which he had fitted up in a style of magnificence suited to the taste of the age. The mansion which preceded this, built by Sir John's father, the grantee of Kelston (he having married a natural daughter of Henry VIII.), is said to have been the largest at that time in the county ('Nugæ Antiquæ,' p. 8). It seems somewhat strange that it should have existed only during one generation. Probably the poet's Italian villa was an adaptation of the older residence to a taste growing into fashion. The queen, we are told, dined 'right royally under the fountain which played in the court.' It is to be regretted that every vestige of this mansion, even of the fountain and the court (part of an old wall excepted), has been swept away: some outbuildings remain, and the foundations of the mansion-house may be traced. A letter addressed by Sir John Harington (probably to Lord Burleigh), presents a view of the city worth repeating on the present occasion.

'The citie of Bathe, my Lord, being both poore enough and proude enough, hath, since her Highnesse being there, wonderfully beautified itselfe in fine houses for victualling and lodging, but decays as fast as their ancient and honeste trades of merchandise and clothing. The faire church her Highness gave orders should be re-edified, stands at a stay; and their common sewer, which before stood in an ill place, stands now in no place, for they have not any at all, which for a towne so plentifullye served of water, in a country so well provided of stone, in a place resorted unto so greatly (being at two times of the yeare, as it were, the pilgrimage of health to all), methinke seemeth an unworthie and dishonourable thing. Wherefore if your Lordship would authorise me, or some one wiser than me, to take a stricte account of the money, by her Majestie's gracious graunt gathered, and to be gathered, which in the opinion of manie, cannot be lesse than ten thousand pounds (though not to wrong them, I thinke they have bestowed upon the pointe of ten thousand pounds, abating but one cipher) I would not doubt of a ruinate church to make a reverent church, and of an unsavourie town to make a most sweet town.'

Sir John, being 'by the unanimous consent of his own age, a man of extraordinary wit,' gave one specimen of it regarding the Abbey Church; for we are told that, conversing with Bishop Montague near the Abbey, it happened to rain, which afforded an opportunity of asking the bishop to shelter himself within the church: care was taken to convey the prelate into that aisle which had been despoiled of the lead, and was nearly roofless. As this situation was far from securing his lordship against the weather, he remarked that it did not shelter him. 'Doth it not, my lord! then let me sue your bounty towards covering our poor church; for if it keep us not safe from the water above, how shall it save others from the fire beneath?' The bishop, we know, became a liberal benefactor.

The style of domestic architecture existing in Bath, at the beginning of the last century, and the species of accommodation afforded to visitors in lodging-houses, may be best gathered from the curious plan which you will find suspended in the lobby. Our intelligent librarian, Mr. Charles Palmer Russell, who is more conversant with the ancient maps or plans of Bath than any other person, and possesses probably the most perfect collection of them, tells me that the plan in question appeared at *three* distinct periods.

To these houses and to this plan you will remember Mr. Macaulay refers. The writer quoted by him is the architect Wood, who published an account of Bath about 1740. He tells us that in his younger days, 'about the year 1727, the visitors to the springs were exposed to the greatest discomforts — the floors uncarpeted and coloured brown, with a wash made from soot and small beer, in order to hide the dirt' (ii. 348). This quotation has exposed the historian to an attack from his bitter reviewer in the *Quarterly*, who censures him for transplanting into the life of Charles II. what belongs more properly to the reign of George II. Evelyn's and Pepy's Diaries, which are also referred to by Macaulay, do not exactly confirm his statements: the former describes the city with streets 'narrow, uneven, and unpleasant.'

Pepys paid a visit to Bath in 1668; so that the first time he saw the city he had attained his thirty-sixth year — an additional proof how little locomotion prevailed in his days. He tells us that he 'resolved to see the Bath and, it may be, Bristol.' He commended the country as, indeed, it deserves. He pronounces 'the town clean, and the streets narrow.' The bathing 'by wholesale, so many bodies together in the same water, struck him as not clean.' The walls of the city he describes as 'good, and the battlements all whole.' Of these but one insulated fragment remains, viz. in the street still called the Borough-walls, near the General Hospital; and, as it has been mentioned in print, I may add, that had I not interposed at a critical moment, this interesting relic would have disappeared. A brighter day approached; but the new buildings, before 1720, were chiefly devoted to public purposes. Between 1727 and 1748 many handsome houses were erected on land belonging to Mr. Gay, the Duke of Chandos, and others.

The talents of Wood have not been fairly appreciated: Warburton strongly censured him, as, unhappily, he did men in general. Many of Wood's works will not stand close criticism, but on the other hand, there are several which prefer strong claims to praise: the north side of Queen-square and Prior-park are the productions of no ordinary architect. I would also call your attention to some specimens of domestic architecture, which existed in the days of Allen and Nash, from drawings by Mr. Lansdown, now laid upon the table: others might be placed before you of the same period, where something of a palatial character was given to the residences of such men as Viscount Weymouth and Mr. Allen. When London was little frequented by country families, these winter residences in provincial cities furnished to their inhabitants many of the gaieties which are sought by the present generation in the metropolis. This change is,

of course, the main reason why many of our provincial towns have fallen into decay."

The Rev. Mr. Scarth followed with a paper on the Roman antiquities of Bath, of which he gave a very full account. Mr. C. E. Davis, architect, read a descriptive paper on the churches of Bath, and then, under the same gentleman's guidance, the members visited the cathedral and other structures in the city. There was a public dinner, with some interesting speeches; and in the evening Mr. Pettigrew read a paper

"*On the Prevalence of Yew-trees in the Churchyards in Somersetshire, and on other Funeral Emblems derived from the Vegetable Kingdom of Nature.*"

"Prior to the invention of gunpowder, the demand for bows must necessarily have been very great, as warlike proceedings were chiefly carried on by archers. This may perhaps account for the great plantation of yews, and the churchyard would not only offer a place of security for their growth, but also probably give a suitable soil, these trees requiring a damp ground, or one of clay and loam. At what time yew-trees were first planted in churchyards does not appear to be known, either to botanists or to antiquarians. There is a statute 35 Edward I. (1307),—*Ne rector arbores prosternet in cemeterio*,—which Dallaway thinks may probably refer to them, and to their being planted for the supply of bows to the parishioners. An Act of the time of Edward IV. ordains that every Englishman in Ireland, and every Irishman in England be furnished with a bow of his own height, and made of yew, witch-hazel, or ash. Witch-hazel was used by persons under seventeen years of age, to prevent the great consumption of yew.

The wood of the yew was well adapted to form bows, being very firm and compact in its growth, presenting very small annual rings; so much so that no less than 280 have been counted in a piece of wood only 20 inches in diameter. The tree is of very slow growth, and attains a great age. Sir John Sinclair mentions one in the churchyard of Fontingall, in Perthshire, measuring 52 feet round, which is, I believe, the largest known: at Kerne churchyard, Devon, there is a yew-tree measuring 27 feet in girth; and at Mamhead, in the same county, one of 29½ feet: at Staverton churchyard there is one, according to Mr. Polwhele, of many hundred years' standing, it being supposed coeval with the church. The trunk of this tree is now so excavated by age that several people may walk into it together, and there stand erect. At Hardham churchyard, Sussex, are the remains of an English yew of gigantic dimensions: its trunk is capable of holding twenty-seven people, its girth 23 feet, and, supposing it were solid, it would contain not less than 500 cubic feet of wood. Thirty-three years since the top of this tree was blown down. It is of a great age. The period of endurance of yew-trees has not been ascertained; but it is very confidently stated that there is evidence of their having existed for more than 1,000 years. They never grow to any great height, 58 feet being, I think, the tallest known: this is to be seen in the churchyard at Harlington, near Hounslow. Fountains Abbey, in Yorkshire, is remarkable for its yew-trees, which are said to have attained their growth at the time of the erection of the abbey, as far back as A.D. 1132. It is singular that there should exist no very theological legend connected with the yew. Mary Queen of Scots had a yew-tree on her coinage to perpetuate the Cruxton Yew, beneath which she gave her consent to marry Darnley. The tree is indigenous to this country, and when its longevity, its durability, and the perpetual verdure it presents, are taken into consideration, it is not surprising that it should have been recognised as an emblem of the immortality of the soul, and employed about our churchyards to deck the graves of the deceased."

Flowers say Mr. Leigh Hunt, "besides being beautiful themselves, are suggestive of every other kind of beauty—of gentleness, of youthfulness, of hope. They are evidences of Nature's good nature; proofs manifest that she means us well, and more than well; that she loves to give us the beautiful in addition to the useful. They naturalize bad with good; beautify good itself; make life livelier; human bloom more blooming; and anticipate the spring of heaven over the winter of the grave. Their very frailty and the shortness of their lives please us, because of this their indestructible association with beauty; for while they make us regret our own transitory existence, they soothe us with a consciousness, however dim, of our power to perceive beauty; therefore of our link with something divine and deathless, and of our right to hope that immortal thoughts will have immortal realization. And it is for all these reasons that flowers on graves are beautiful, and that we hope to see them prosper accordingly."

On Saturday the excursion included Widcombe Old Church, Prior-park, Combe-down, Hampton-down, Bathampton Church, Batheaston Church, Little Sodbury, Swainswick Church, Langridge Church, Lansdown; Waller's Entrenchments, Roman and British encampments, rendezvous at the grand stand on the race-course, Chapel of St. Lawrence, and Charlcombe Church. It will be admitted by all who are conversant with the above route, that it can scarcely be surpassed in scenic beauty or interesting associations in any part of England; for whether the visitor revels amidst the delightful scenery of Prior-park, so intimately associated with Ralph Allen, Bishop Warburton, and Pope, or explores the well-defined remains of the Roman and Belgic encampments on Hampton-down, Solsbury-hill, and Lansdown, or contemplates the venerable memorials of the dead in the sacred edifices of Swainswick, Bathampton, and Langridge, he will find abundant sources of mental gratification and interest.

Papers descriptive of the various churches visited, were read by Mr. Jeffrey, and on the earth-works by Mr. Scarth, and are reported, we may say, in the *Bath Chronicle*. Of

Wellow Tumulus,

Mr. Scarth said, that, together with the camps and places of worship, or judicial meeting, of the Belgæ, or other ancient British races, must also be noticed their burial-places, of which the most perfect in this kingdom, and he believed nearly the last, still exists at Wellow, four miles from Bath, and within the boundary of Wansdyke. This is a chambered tumulus, which has been carefully described by Sir R. C. Hoare, in the 19th vol. of the "Archæologia," where an accurate drawing of it, and measurements made by the late Mr. Skinner, of Camerton, are given. A similar chambered tumulus exists at Uleybury, in Gloucestershire, and has been described by Dr. Thurnam, in the Journal of the Archæological Institute, which contains also a drawing of it. Another formerly existed in the parish of Butcombe, which is described in one of the old numbers of the "Gentleman's Magazine," and a drawing given of it there. This, he regretted to say, is now totally destroyed. Mr. Phelps, however, has recorded it in his History of Somerset. The tumulus at Wellow would by this time have probably shared the same fate, had it not been discovered to have become ruined by the frost of the winter before last, by two of the members of the Bath Naturalists' Club, who had walked over to examine it. This being represented to the Somersetshire Society by one of the members, he was empowered to have it put into its original state, so that no further damage might ensue, which has accordingly, by the permission of the owner of the property, and the occupier of the farm, been done effectually, and it is hoped that this ancient record of the primitive places of sepulture of our British forefathers, may be preserved still for many years. He need hardly remind this learned body that the most striking monument of this kind which still exists is to be found at New Grange, in Ireland, and has been described in the "Archæologia," by Gov. Pownall, who has written so much and so well on the Roman antiquities of Bath.

The writer in the *Gentleman's Magazine*, who describes the chambered tumulus, near Butcombe Church, supposes it to have been the burying place of the Druids, the priests of Stanton Drew, from whence it is distant four miles, lying in a still and secluded hollow. It was more probably the mausoleum of some chieftain's family of the same period when the temple of Stanton Drew was invested with all the sanctity of early superstition.

In Langridge Church, which is only 50 feet long by 18 feet wide, a fine Anglo-Norman entrance challenged admiration. Among the monuments are the effigy of a lady, in the dress of the reign of Henry III. and a Virgin and Child of still more remote antiquity. The members all agreed in the value and interest of the latter relic, and will probably take steps, either by a plaster cast or by an illustration in their published proceedings, to obtain the opinion of antiquaries upon the probable date of a work of art which may prove to be one of the earliest essays of English sculpture.

At the concluding meeting a paper was read by Mr. W. Tite, M.P. "On the Condition of the Working Classes, and of their Dwellings during the Middle Ages," and then some complimentary resolutions closed a very successful congress.

Mr. Pettigrew, in acknowledging a vote of thanks for his aid, reviewed the labours of the association during the week, pointing out the services it had been enabled to render to science, and acknowledging the assistance which it had received from the local authorities. Mr. Pettigrew also expressed the obligations which archæology owed to Mr. John Britton, and the gratification it gave him to see the veteran antiquary present upon the occasion. This allusion was loudly cheered by the company.

We may add that in the examination of churches the members were assisted by Mr. Burnell, architect, in addition to the gentlemen already named.

MUNICH.

The Old Mural Paintings.—The old paintings found at the house of M. Lebeling, in the Promenade Strasse, some time ago, have now been completely restored and elucidated. They have been purchased for the Bavarian National Museum, by King Max, who took such interest in them, that the process of restoration by the artist, M. F. Reichard, was reported by telegraph to Berchtesgaden, probably the only time that *art* has been thus honoured and noticed by any kingly personage. The first difficulty was to remove them from the wall, and place them on wood, which process was also witnessed by the art-loving king. As far as technicism is concerned, the mural paintings are no frescoes, as first thought, but oil paintings. The colours being strongly pictured on a well-polished ground of plaster of Paris, could be detached in large flakes, but they had originally covered the whole surface, and being made in a bold and free hand, bespeak a very skilful artist. Where, however, the colours have not scaled off, which is not often the case, they have remained in their original freshness, and only the violet and the carnation tones have somewhat suffered. The place where these paintings were found, formed an oblong square, 28 feet long, and of proportionate breadth, and probably all the four walls had had similar ornamentation.

On the north side appear in a frieze, 4 feet high, nine representations of the life of Christ, viz. the Miracle of the Loaves and Fishes, the Samaritan at the Fount, &c. On the walls below the frieze, other subjects are represented, amongst them a picture of the Trinity, 7 feet high and 6 feet broad. The painting completely exhibits the character of the Bavarian school at the end of the fifteenth century, as on the very interesting picture which Hans Olmdorf painted in 1491, for the altar of Blumsberg, similar ideas and figures are to be met with. Six painted medallions, lackered with gold and silver, on red, which appeared on the upper northern wall, under the frieze, show clearly the place where the chandeliers have been placed, which proves that the locality was used once as a chapel. The great number, variety, and execution of these mural paintings, constitute them some of the most interesting of the present time. Hence, therefore, they were first considered older than they really may be. According to the details of the costume, which in some cases is gorgeous, they were painted about 1480 or 1500. The last question to be determined was,

who can have been the private individual who, at such a remote period, and when Munich was a small town, could have had this private chapel thus richly ornamented. There exists a *Sual und Grundbuch* of that city of 1630, and a still older relievo model of Munich, made by Jacob Sandtner, about 1571. In the latter appears a stately, old-fashioned house, at the corner of the then Pranner-strasse. It has been, therefore, thought that these fine chapel-buildings have been made for a rich brewer, Nicod. Hering, whose house appears in 1465, as one of the rateable property.

The Schelling Monument.—This memorial, erected by King Maximilian to his teacher, is one of the finest of modern times. It presents a monumental *façade* of three compartments; the architectural proportions, the splendid arrangement, and the artful ornamentation of which speak highly for its talented projector. The upper portion of the monument consists of a pediment, which is open below, and surmounted by rich acroteria, above which a cross is placed. A square, widely scooped out, and opening, conceals the colossal *bust* of Schelling, on an ornamented pediment, made by Halbig. The second compartment of the monument has the same main breadth, but the cornice projects on both sides about 1½ foot, and is supported by two caryatides, above the heads of which capitals with rich acroteria are placed. Another square recess shows an *alto-relievo*, where the philosopher is represented as teaching a host of young men, in a hall supported by pillars. These two compartments of the monument are of the marble of Schlanders. The third (lowest) compartment of the monument, built in a pyramidal form, consists of a socle, divided into two parts, and is of Salzburg and Swiss marble, of a red tint, contrasting with the colours of the upper part. The height of the monument is about 18 feet, and the arch 10 feet broad. The caryatides hold stiles and tablets in their hands. The sculptures of the Schelling monument were executed by M. Kuntner. The plan has been made by the Oberbaurath and Professor of the Academy of Munich, M. Ziebland.

THE DISPOSAL OF THE DEAD.

We still hear of interments in positions where they should not be permitted, and find individuals even now obstinately denying the evil of piling up dead bodies in the midst of the living. During the inquiries into the Rugeley poisoning cases, two bodies, which had been for a space of time interred, were dug up, by legal authority, from what was supposed to be their last resting-place. One had been put into a wooden coffin, the other into the more aristocratic casing of lead. According to the newspapers, the two coffins were removed from the graves to an inn. The corpse in the wooden coffin was dry—the gases had evaporated; but in the other instance (the lead coffin), on boring a hole, and afterwards making a larger opening, the poison that escaped was such that several of the jury fainted, and all were affected. Does not this make the evil clear?

Many of the London grave-yards have been closed, and the rest must follow: it will never do to continue burying 130 bodies on a single Sunday in one grave-yard, as we are told is the case at present at Bethnal-green.

Instead of the thickly-packed metropolitan grounds, burying places have been provided in various parts of the suburbs. This has led to considerable changes in the cost and manner of funerals, which press rather hardly on the poor, particularly when old-fashioned plans are persisted in.

The strong arm of the law has obliged the parish authorities to remove the graveyards to a distance: this causes an expense of from 15s. to 1*l.* for conveyance alone from St. Pancras to Finchley, and so in proportion. This sum in addition to the cost of the ground and other fees, is a serious one to many; and the bodies of the dead are, in consequence of the difficulty of raising it, often kept at home until they have become dangerous.

When an individual in the midst of two or three millions of people dies, the body ought to be removed without loss of time; but then, survivors say, how can we part suddenly with what remains of those we have so much loved. The parishes, in several instances, have provided places for the reception of bodies until the friends of the deceased can arrange for the funeral. The value of this accommodation is very great, particularly when the receiving-houses for the dead are well placed, and yet it is not much used by the great numbers of the London poor who so much require it. In some instances, too, the London undertakers have made provision on their own premises for the reception of the dead until the time fixed for the funeral. This is not always good, for many of these places are in close neighbourhoods, where numbers of persons are living all around—indeed, in some cases, in the same house. Prejudices have to be overcome, and all may aid in doing this. There are often difficulties in the way of an early burial, and in such cases the body should be removed to a proper reception-house, where it could remain till the arrangements were complete.

Accounts and engravings of funeral pageants—in the olden time—show that the pomp and display and cost were extraordinary. The expenses on these occasions often crippled even noble families for years. With each succeeding generation, as information has spread, the heralds' emblazonry, the banners, the feasting and inebriety of such ceremonials have been gradually dispensed with. The other day the venerable poet Rogers was, at his own request, quietly buried in the pleasant churchyard at Hornsey. He might have been carried with all the pomp and feathers to Westminster Abbey: the poet's choice showed the poet's sense. Sir Robert Peel wished to be and was unostentatiously buried. Other eminent men have set the same good pattern. All this, together with the absolute need, will work its effect. It requires many efforts, however, to conquer old prejudices, and to overcome ignorance.

We grieved to see that in the case of the premier's brother, Sir William Temple, evil was persisted in, with a full acknowledgment that it was evil. The body was interred in Romsey Abbey Church, under the west window. It is stated that "Every precaution which modern sanitary science has made known was followed. The coffin, surrounded by powdered charcoal, was to be bricked in, and a small tubular shaft projected from the vault, through the wall, to the outside." Lord Palmerston ought to have carried his own views and enactments into practice.

The graveyard question, not yet quite settled, must not be overlooked, if we would have the Registrar-General continue to show clean bills of health.

"STEEL AND MALLEABLE IRON MADE WITHOUT FUEL."

Although, as we have already noted, the great discovery of Mr. Bessemer (taking for granted in the meantime that it will really prove itself ultimately not unworthy to be so called), is not, strictly speaking, a formation of steel and malleable iron without fuel,—we still retain the title by which the process has become known. Since our last article appeared, an immense amount of correspondence has been printed and published on the subject, *pro* and *con.*,—much of it evidently by interested parties, especially those who feel alarm rather than pleasure at the idea of the introduction of such a process as that contemplated.

The main *facts* to be recorded since our last are, the repetition of an experiment by Mr. Bessemer, to show to experienced persons the nature and results of his process, and trials by others, showing the alleged result of testing (so far) the iron yielded in Mr. Bessemer's experiments.

A correspondent of the *Staffordshire Advertiser*, last week, in announcing the result of the second trial referred to, says,—

"The opinion that Mr. Bessemer's invention will prove the precursor of a complete revolution in the iron trade continues to gain ground. A second trial was made on Monday last, and amongst those present were General Lord Rokeby, Mr. J. H. Blackwell, Mr. Richard Smith, Mr. James Nasmyth, Mr. Thomas Barker, Mr. E. B. Dimmack, Mr. H. Firmstone, Messrs. Walker, of Gospel Oak; Messrs. Davis and Bloomer, Mr. Henry Martin, Mr. Thomas Rose, Mr. E. J. Wright, Mr. Haden, Mr. Smith, of Windmill End; Mr. James A. Shipton, Mr. Jobson, and many others. Seven hundred weight of gray Blaenavon pig—which is *a very first-class quality of pig iron*—was melted in a cupola, whence it was run into a converting furnace, and after undergoing Mr. Bessemer's process for twenty-six minutes, was tapped out. Numerous small specimens have been brought into the district, and have been rolled and beaten out into thin sheets and small bars. The iron produced is malleable and fibrous, and no doubt of the excellence of the invention remained on the minds of those who witnessed it. Many are *desirous of seeing it tried on ordinary kinds of pig iron*, in order to see if it would be equally efficacious with them. Although in several cases small portions of the iron so produced have been rolled out—in one case spread over the surface of a hoop in a very thin layer—and the general appearance indicates its toughness and excellent quality, so far as we have heard no careful test of its power of resistance has been made, although a gentleman is about to make one with a small bar. Several applications from some of the first iron-masters are said to have been made to Mr. Bessemer for licenses to use his invention, but it is further stated that the inventor demands 10s. per ton on all iron produced by the process as his charge for permission to employ it. If the process were applied to all the iron made in the kingdom at this rate, Mr. Bessemer would receive a million and a half sterling per annum. It is generally thought that if the invention has such a price put upon it the temptation would be so great as to lead to numerous attempts to evade the patent, which would lead to lawsuits, and perhaps to its loss; and that Mr. Bessemer would consult his own interest by fixing a much lower rate of interest for the use of his invention. It is said that a license for the use of the new process has been taken by the proprietors of the Dowlais Works, in South Wales, formerly belonging to the late Sir John Guest, but the terms have not transpired."

This alleged license involves another of the reported facts to which we alluded. The *Merthyr Guardian* states that Mr. Bessemer's process was tried at the Dowlais Works in course of week before last, and that although—

"The blast-pipes by some means became clogged, so that the full amount of cold air could not be brought in contact with the liquid metal, nevertheless, the experiment was considered eminently successful. Iron of a tolerable quality was produced, capable of being worked by smiths into the various articles that may be required."

In reference to the material produced at the first trial, a correspondent of the *Wolverhampton Chronicle*, who describes himself as one of the witnesses of that trial, says,—

"Undoubtedly, malleable iron was produced, just as described by Mr. Bessemer himself; and a piece of the spongy scrap spilt upon the ground, or knocked off the corner of the ingot then made, was this morning, by the help of a blacksmith's fire in this town, shaped into a very satisfactory little piece of wrought-iron bar, exhibiting fibre in its fracture, and otherwise indicating good quality. None doubted that completely malleable iron had been produced; and the general impression seemed to be favourable as regarded the ultimate success of the invention; but it was an equally general impression that practical difficulties would prevent the present puddling process being immediately superseded. *The experiment would have been much more satisfactory had an average good quality of pig iron been employed instead of the 'Blaenavon,' which is a first-rate iron.*"

While the iron was thus being tested and declared to be malleable iron, many writers were proving that it would not and could not be malleable iron. It certainly casts a doubt upon the importance of the alleged results, however, that common pig iron was not used *in either trial.*

The Wolverhampton correspondent of the *Mining Journal* says, in reference to the iron of the first trial, "I have seen some specimens of the iron then made, which has been rolled and hammered, and which exhibits great toughness, and is acknowledged by all who have seen it to be of excellent quality." And another correspondent of the same paper states that at a blast furnace of his in South Wales, by a singular accident, which occurred while Mr. Bessemer was in the act of reading his paper to the British Association, "the very malleable iron which he was then describing" was produced by means of a blast of hot air playing on some of the

crude metal which had got separated by the giving way of a part of the lining of the furnace, and which the workmen had to cut out afterwards with the cold chisel, occasionally bestowing anything but blessings on the "infernally tough stuff," which, however, was thrown away, but afterwards sought out and tested when Mr. Bessemer's paper was published, and found to be "to all intents and purposes a malleable iron."

The specification of patent under which the American, Mr. Martien, claims priority of discovery, or at least of patent right, to Mr. Bessemer, plainly shows that he never contemplated the production of steel or malleable iron on the great scale, if at all, nor the melting of steel and malleable iron by intense heat, produced in a manner without fuel, as Mr. Bessemer did; the air, in his process, being applied to the cast-iron in the mere "channel or gutter" through which it was to "flow from" the blast furnace, or the refinery furnace, into the mould. An attempt is now being made to convert this "channel or gutter" into "a vessel," or gigantic cupel, such as Mr. Bessemer's; but there is little chance, we should think, of such an attempt being successful. The mere refining of iron by means of air, in whatever way accomplished (and many ways have been resorted to), is not the only, or the chief, point at issue.

In conclusion, and on the whole question, we can only, in the meantime, repeat what we have already said,—that, *if there be no exaggeration here*, the productibility of cast steel and malleable iron will now, and only now, become commensurate with the great scale on which pig-iron has heretofore been produced, and the cost of both cast-steel and soft-iron accordingly, as well as from saving of fuel and time, be immensely reduced.

CHURCH-BUILDING NEWS.

Lincoln.—The church of St. Michael on the Mount is to be opened for Divine service on the 16th inst. The building consists of nave, transept, north aisle, and chancel, and is capable of accommodating 350 persons, in addition to the boys of Christ's Hospital. The church is in the Early Decorated style, with a five-light window at the west end, and a four-light window in the transept, and two-light north and south windows. Three two-light windows in the chancel (which has an apsidal termination) have been filled in with stained glass, to the memory of R. Smith, M.D. the founder of Christ's Hospital, and to that of the late Bishop of Lincoln. The porch has been left in an unfinished state, until funds can be obtained to build a tower over it. It was the original design of the architect to build a bell turret over the chancel arch, for which the east wall of the aisle and transept form the buttresses; and the transept also materially tends to support the south side of the church, which is built on the side of a hill, and the foundations have been taken down to a great depth. The roof timbers of the building are stained. The seats are made of yellow pine, stained and varnished. The paving is of Yorkshire stone, with Minton's red and black tiles in various patterns. The carvings have been executed by Mr. Mowbray; and the gas fittings have been furnished by Messrs. Skidmore, of Coventry. Mr. Teulon is the architect, Mr. Ward the builder, and Mr. Geo. Bacon the foreman.

Worcester.—St. Martin's church, which has been closed during the last four months, for the purpose of making some extensive alterations and improvements therein, was re-opened for divine service on Tuesday in last week. Among the alterations is the new window at the east end, for the better display of which the arch over the communion has been raised. It is after the Byzantine style, designed by Mr. W. H. Hopkins, who has superintended all the alterations, and the stonework has been executed by Mr. Norman. The glass is not completed, and the effect cannot be even guessed at from the small quantity at present fixed. There were formerly two aisles up the sides of the church, but the whole of the pews have been re-arranged, and now give eighty additional sittings, or about 560 in all; a portion of them free. The flooring, which was in a very bad state, owing to the frequent opening of the vaults which run under the whole of the edifice, and at times emitted offensive and unwholesome smells, has been entirely renewed: the vaults have all been arched and covered with concrete, while ventilators are introduced all round the building so as to keep up a current of air under the flooring. The brick and woodwork have been executed by Messrs. Priddey and Son, Lowesmoor, and the ceiling and walls have been coloured by Messrs. Collins and Langford. The entire renovation has been undertaken by the rector, the Rev. T. L. Wheeler, on his own responsibility, but he has received considerable assistance.

Stroud.—The portion of the new cemetery on Stroud-hill, intended for the burial of members of the Established Church, was consecrated by the bishop of the diocese on Monday before last. The new cemetery is a sloping piece of ground, five or six acres in extent, situate about a quarter of a mile out of the town, on the road to Bisley. It has been laid out with shrubs and walks by Mr. W. Foster, nurseryman.

Middlewich.—A mortuary window has been erected in the chancel of the parish church of Middlewich, to the memory of Miss Elizabeth Nugent, by her sister, Miss Lucy Nugent. The restoration of the window was carried out by Mr. Joseph Clarke, architect; and the glass was furnished by Mr. D. Evans, of Shrewsbury. The central compartment of the main window is taken from the Vision contained in Rev. xii. 4-6, as a symbolical representation of the struggle between Christianity and the Pagan Idolatry of the Old Roman Empire. Michael the Archangel, being "one like unto God," and being spoken of in connection with the angels as "Michael and his Angels," is regarded as identical with the Son of God himself in the principal subject, and the rest of the window is filled up with angels. The figure on the north side of the main window represents the angel which appeared to the women at the Sepulchre of Jesus. The south side represents the two angels which appeared to the Apostles after the Ascension of Jesus. On a line dividing the subject from the memorial is inscribed the "ter Sanctus."

Cardiff.—The whole of the niches in the chancel of Saint Mary's church, Cardiff, are to be filled up with painted glass. Mr. George Crittenden, architect, has been engaged in making preparations for the improvements.

Liverpool.—Some time ago it was arranged to erect, at Everton, a Roman Catholic cathedral. Mr. E. Welby Pugin furnished the design, which is that of a full cathedral edifice, to be dedicated in honour of St. Edward, and also to serve as a parish church. It is to be in the form of a cross, with a large central tower. The choir will be fully 100 feet long, with side aisles, and an interior elevation of nearly 100 feet. This space will be chiefly lighted by clerestory windows, enriched with tracery. The choir will be divided off from the northern portion of the edifice by a transept, 28 feet wide between the pillars, at the eastern end of which is to be placed the great window; the shorter limb of the cross projecting beyond the transept of the north. A portion of this structure was a considerable time since commenced, and is now rapidly drawing towards completion. This portion, as described by the local *Journal*, consists of that part of the edifice which is cut off from the choir by the rood screen, and which, in the completed cathedral, will be used as the private chapel of the dean and canons; and, in this instance, is to the south of the screen. It is 40 feet long, and has side aisles. This, in the present instance, will be used as the chapel of the college, with which it is to be connected by a range of cloisters. In addition to the private chapel, there is also included a transverse space, 20 feet wide by about 80 feet long, intended for the accommodation of general worshippers. The whole of this is in an advanced state, and the contractors, Messrs. William Baynes and Son, of Liverpool, will have it ready for consecration within a month from this time. The portion of the edifice now in progress, which may be taken as indicative of the general style of its architecture, is of the Pointed style. It is of rustic mason work, the walling being of Upholland stone; and the facings and dressing labels, as well as the window mullions, being from Stourton quarry.

Blackpool.—The new Roman Catholic Church here, which was commenced in May last, is now up to the eaves course, and will probably be covered in by the end of next month. It consists of a chancel, 24 feet long and 17 wide; nave and aisles capable of containing accommodation for 600 people; two transepts, with chapels, two sacristies, and a south porch, with a tower at the west end. The entire building measures 126 feet long by 60 broad. The stone used in the dressings is from the Minerva Quarries, near Wrexham: the rubble is from Yorkshire. This work is being erected at the sole expense of Miss Tempest, of Broughton Hall. Mr. E. Welby Pugin is the architect. The contract amounts to something over 5,000*l.* and is taken by Mr. Yates, of Liverpool.

Bolton.—A new Unitarian chapel, costing 3,900*l.* has been opened at Bolton. It is in the Gothic style, of the Early English period.

Glasgow.—In laying the foundation-stone of the new Free Church College and Church lately, in this city, Dr. Clark, hitherto of no mark or prominence in the denomination, gave the princely donation of 20,000*l.*

Brechin.—The new Free East Church, in Panmure-street of this town, has been formally opened. The roof is unceiled, and the couples and purlins are stained of dark oak. The large north window is fitted with stained glass. The gaslights are fixed in two groups of jets in the roof, the light being thrown down by reflectors. Except the roof, no part of the edifice is yet painted.

PROVINCIAL NEWS.

Ditton.—The roof and side of a house at Little Ditton, belonging to a bricklayer, had been in a tottering condition for some years, and fell in on Sunday in last week, but fortunately none of the inmates were hurt. Three cottages adjoining are all in much the same state, though still containing inhabitants.

Teignmouth (Devon).—The following is the list of tenders for building infant-schools, and alterations to old school buildings, at Teignmouth; Mr. Thomas Bradbear, surveyor. For the new buildings:—

Fletcher	£228	19	0
Soper	225	0	0
Willcocks	213	0	0
Prideaux	209	10	0

Including the alterations to present old buildings, the tenders were:—

Soper	£323	0	0
Fletcher	315	0	0
Willcocks	304	0	0
Prideaux	272	0	0

Liverpool.—The sculptural group on the tympanum of the portico at St. George's Hall having been much begrimed with soot and other impurities, says the *Journal*, has been thoroughly cleaned, and the figures now stand out in much stronger relief. Since they have been cleaned, the figures have received a coating of boiled oil and turpentine, with a view to their preservation. The first of the colossal lions, intended as ornamental adjuncts to the eastern balustrade, was placed on its pedestal, at the southern angle of the balustrade, on Wednesday in last week. At a meeting of the St. George's Hall Committee of the town council, last week, Mr. Bennett complained of the continued expense going on at the boundary-wall of St. George's Hall. "Absurdity after absurdity," he remarked, "is added to it, until it will be found one large mask or screen to the hall, and a very heavy expenditure indeed. I have seen this morning one of the lions upon the pedestal, and a more absurd decoration I can scarcely imagine. The lions themselves are more like the chairman of St. George's Hall Committee than like lions. There are other things to do,—such as Lime-street to lower; why cannot that be proceeded with and done, before the enormous expenditure of ornamental gates, towering up about 15 feet, and overlooking an area you might jump over; and before the enormous globes, or whatever else is intended to be put on those granite pillars, with Mercuries flying on the top, to crown the absurdity of the whole." He trusted

the committee would stop before they incurred farther expense, otherwise he would move a resolution of council as to it.

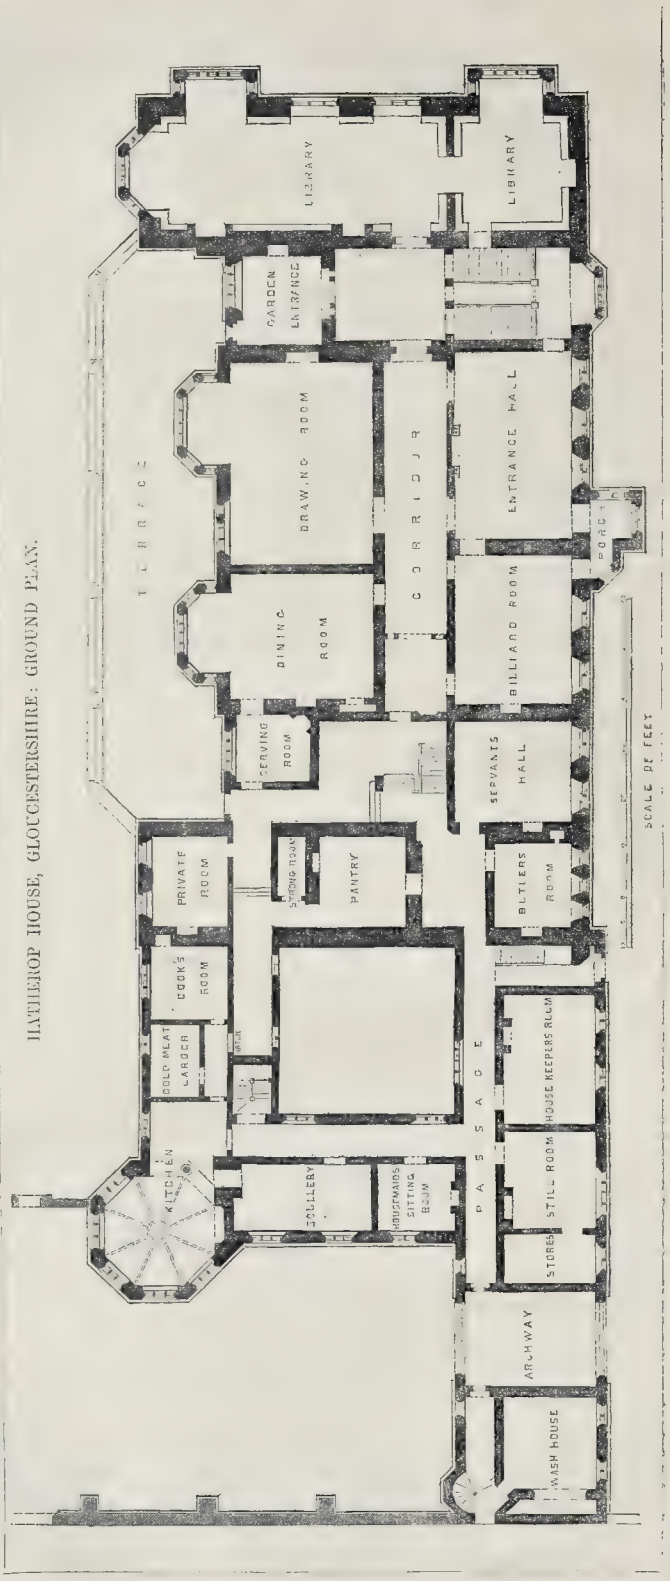
Rotherham.—At the periodical meeting of the Local Board of Health, last week, the Board proceeded to the election of a surveyor, vice Mr. Baylis, dismissed. It was stated that there were forty-one candidates, and that the committee had selected four, viz. Mr. Charles Dobb, of Rotherham, who asked 100*l.* a-year; Mr. Charles Rawson, of Rotherham, who undertook to do the work for 100*l.* but required 200*l.* for his whole time; Mr. W. H. Stead, who required 75*l.* a-year; and Mr. John Hartley, who asked 130*l.* On the first vote the larger numbers were for Mr. Hartley and Mr. Rawson, and ultimately Mr. Rawson was elected by the casting vote of the chairman, at 100*l.* a-year, on the understanding that he was required to resign on receiving three months' notice from the Board to do so; otherwise Mr. Hartley to have the situation.

Darlington.—A committee of the Darlington Board of Health has reported in favour of erecting a fountain on the site of the ancient cross in that town.

Dundee.—The town council of Dundee have resolved, by a majority of 14 to 6, that the salary of their surveyor, Mr. Fulton, shall be raised from 250*l.* to 350*l.* a-year, for five years, with special reference to the increase of his duties in carrying out the drainage of the town, on which it is expected that for that period a sum of 10,000*l.* will have to be expended.

PROPOSED MONUMENT TO THE DUKE OF WELLINGTON.

Sir B. Hall, bart. M.P. as Chief Commissioner of Works, has given notice, that it is the intention of her Majesty's Government to erect a monument in St. Paul's Cathedral to the memory of the late Duke of Wellington, and has invited designs from artists of all countries. The cost, with all expenses, must not exceed 20,000*l.* The models by artists residing in the United Kingdom, must be sent in by the 1st of June, 1857; those by artists residing abroad, on or before the 25th of the same month. There will be a public exhibition of them in July, 1857. The following premiums will be given for the nine most approved designs:—



For the First	.....	£700
,, Second	.....	500
,, Third	.....	300
,, Fourth	.....	200
,, Fifth	.....	100
,, Sixth	.....	
,, Seventh	.....	
,, Eighth	.....	
,, Ninth	.....	

If, however, the artist to whom the highest premium may be awarded, shall be employed to execute his design, he will not be entitled to receive any premium. The models in respect of which premiums may be awarded, are to remain the property of Government.

Accompanying the instructions, the chief commissioner has issued a plan and sketches showing the position the monument is to occupy in the cathedral, a very necessary arrangement for distant competitors.

HATHEROP HOUSE, GLOUCESTERSHIRE.

The residence of which we give a view and plan in our present number, is situated three miles from Fairford, in Gloucestershire. The building is erected with the stone of the county, the inside of the walls being lined with brick, the outside faced with limestone, with a dressed face. This latter came principally from Bibury, as also the stone for the dressings. Internally, the fittings are very elaborate, particularly the ceilings, which are highly ornamented in plaster decorations. The woodwork is of oak. The dining-room and drawing-room (internally) are the only parts of the building not yet completed. The joiners' work was executed by Mr. Ruddle, of Peterborough. The cost of the building, exclusive of stabling, will be about 20,000*l.* The architect is Mr. Henry Clutton, of St. James's.

HATHEROP HOUSE, GLOUCESTERSHIRE: GROUND PLAN.

HATHEROP HOUSE, GLOUCESTERSHIRE.—MR. HENRY CLUTTON, ARCHITECT.

ARCHITECTURAL MEMORANDA IN ANGLESEA.

THE north-eastern corner of the island of Anglesea contains many interesting examples of architecture for the study of the tourist archæologically inclined, as well as for the architect whose leisure or business may lead him that way. Within the compass of a few miles are remains dating from the early British period to the latest time that can be denominated "ancient," to say nothing of the world-renowned works of modern times which span the Menai Straits and seem to divert notice from those of an earlier age.

Beaumaris may be considered the centre of the group of remains of which I wish to give your readers a slight sketch, and to begin with the origin of the town itself. Beaumaris seems to have been of little importance previous to the time of Edward I. There are traces of an old Roman road running past the town towards Priestholme, which, no doubt, was in connection, by a track through the island, and across the strait, with the two Roman stations at Segontium (Caernarvon), and Conovium (Conway). In the year 1096 the earls of Chester and Shrewsbury invaded the island and the opposite country, and planted the first Norman strongholds on the soil. These earls built castles or forts at Bangor, and at Lleinog, about two miles from Beaumaris, towards the east. Of the castle at Bangor faint traces exist, overgrown with a young plantation, and standing on the cliff that overhangs the entrance of the town. The existence of this castle is so little known that even the inhabitants of the town cannot tell anything of it, nor are they aware that one ever existed. The site is, however, marked in the Ordnance Map. The castle of Lleinog, though almost as little known, is still nearly perfect as regards the outer walls. It stands on a rising bank, on the east side of a small stream, about a furlong from the seashore. A large and very lofty artificial mound is encompassed by a broad ditch, and there appear to be some outer earthworks at the approach from the brook, but quite obscured by thick underwood. On the summit of the mound stands the castle, a simple square inclosure, the walls about 9 feet high, built of undressed limestone, and at each angle a circular bastion of about 9 feet circumference and 15 feet high, three of which are almost entire. The parapet has been guarded by battlements, and projects about 6 inches, at 6 feet from the ground, and the bastions are loopholed. From the castle to the shore ran a covered way, and on a small promontory at its termination is a mound, on which a round tower formerly stood, though only a few scattered stones remain. It has evidently stood to protect the landing-place in the little bay below Lleinog. The Norman invasion, under the confederate earls, was eventually repelled, but apparently by a new claimant to the soil. Harold, son of Magnus, a Northman, made a descent on this coast; and as the forces of Hugh Lupus and the Earl of Shrewsbury stood on the shore to resist his landing, he chose two skilful archers, and placing them at the prow of his vessel, ordered them to aim at the Earl of Shrewsbury, who stood in full mail on the shore. An arrow struck the earl in the eye, and he fell dead, pierced through the brain, the open vizor of his helmet having shown the only vulnerable point to the archers. The Norman forces were afterwards expelled from Anglesea.

On the invasion of Wales by Edward I. Lleinog was occupied by him; and a tradition exists, that when the castle and walls of Beaumaris were erected, stones from Penmon quarry were passed from hand to hand along a distance of five miles, by a line of men extending from Penmon limestone quarries to Beaumaris. An old record is said to exist in a farm-house near this place, being an account of the number of men employed, and the wages paid to them. Between the castle of Lleinog and the mound on the shore which is called Little Lleinog, stands a house also bearing the same name. Some years back it bore traces of work of about the date of Edward I. with later work of the sixteenth and seventeenth centuries; but this house has been modernized, and most of these traces destroyed. The last historical notice of Lleinog Castle is that it was occupied by the Royalists during the great rebellion, but it appears to have had intermediate occupants, as on each face of the walls sloping buttresses have been built; but they are simply erected against, and not worked into, the older masonry: they have the look of late Gothic, but no very clear distinguishing feature. On the north wall also there is a small projection, similar to those in most mediæval castles, down which waste and rubbish were passed into the moat. I have dwelt more fully on this interesting little ruin, because it seems to be little known or noticed; but apart from this, nothing can be more picturesque than its situation. The high mound and moat are thickly covered with trees, and underwood and briers and ivy cover the walls, and choke up the small court-yard, so that it is difficult to distinguish the castle from the surrounding trees. Looking from the bastion, below me lay the quiet fields, sloping sunnily to the south, with the sweet new hay, just mown, and the hedges fragrant with dog-roses, honeysuckle, and a thousand nameless flowers, the broad expanse of blue water running to seaward, and narrowing to the right into the Menai Strait, the rich woods of Llanfaes, Baron-hill, and Penrhyn, and opposite the huge rocky wall of "Penmaen Mawr," crowned by the lines of a large British earthwork, and backed by a dark sea of mountains, ridge upon ridge, and at the extreme left the bold promontory of Ormshead, with the gentle undulating country of the Anglesea shore behind, altogether made up a picture which one might contemplate with pleasure for a long summer day.

I must reserve my remarks on Beaumaris for another paper, as well as those on the interesting priories of Llanfaes, Penmon, and Priestholme, and on the quarries of marble at Penmon.

E. W. C.

EARTH-WORKS.

IN a communication to the Secretary of the Royal Society, published in its "Proceedings" for March and April last (obtainable from Taylor and Francis, Red Lion-court, Fleet-street), Mr. W. J. Macquorn Rankine, C.E. and F.R.S. professor of civil engineering in the University of Glasgow, states that he has a paper in preparation on the subject of Earth-Works, as re-investigated by him in reference to his collegiate lectures, which he proposes to offer to the Royal Society when ready. Meanwhile he communicates to the society (who have published them in the number of their Transactions just specified) the two fundamental principles on which his researches are based, and which are as follow:—

I. *Principle of the Stability of Earth.*—At each point in a mass of earth the directions of greatest and least compressive stress are at right angles to each other; and the condition of stability is, that at each point the ratio of the difference of those stresses to their sum shall not exceed the sine of the angle of natural slope of the earth.

II. *Principle of the Transformation of Structures.*—Let a structure of a given uniform transverse section be stable under a system of forces represented by given lines in the plane of section:—Then will any other structure whose transverse section is a *projection by parallel lines* of that of the first structure upon any other plane, be stable under the system of forces represented by the projections, upon the new plane, of the lines representing the first system of forces.

An Earth-Work Table, we may also here note, has been published by Hodges and Smith, of Dublin, Mr. Joseph Louis Gallott, the author, for the calculation of quantities for all lengths, bases, and slopes, with explanatory instructions on the sheet itself as to its use.

THE WORCESTER EXHIBITION OF MODERN PAINTINGS.—This exhibition was opened on Saturday week, at the rooms of the local Society of Arts. The attendance, it seems, was by no means large, although the number of pictures this year is greater than has ever been got together before at Worcester, and even the quality improving.

DECAY AND PRESERVATION OF STONEWORK.

IN a notice recently of what is called Daines's patent for the preservation of stone, we said that the process appeared to be similar to, if not the same as, that patented by Barratt. This has brought a number of letters, including as well Mr. Barratt as the solicitor engaged in the prosecution of Daines's patent. While the latter gentleman terms it a misstatement, but says nothing to remove the impression founded on evidence before us,—Barratt thinks it has a tendency to give a value to a process to which he gives a very harsh name, and further asserts, that whatever is good in the process was obtained from him. He goes on to say, moreover;—"Let him amalgamate the sulphur and oil by the process of heat ever so well, the instant he applies that solution, the oil alone will penetrate the stone, the sulphur remaining on the surface in the form of a powder, which may be brushed off at will. Farther, so well will the sulphur combine with the oil, that suffer the solution to remain quiescent for a few hours, and you will get back the sulphur in the form of a precipitate, in its native purity."

Into the personal dispute we are not disposed to enter, but we may say of our own knowledge that not very long ago the only patent for preserving stonework in which Mr. Daines took any interest was Barratt's.

If either patentee have a process by which, at reasonable cost, stonework *in situ* may be stayed from decay and not injured in appearance, it is one of great value, and should have its truth confirmed.

Sir Charles Barry objects very strongly to the use which has been made of a certificate given by him as to the effect of the solution on parts of the stonework at the Houses of Parliament, applied about two years ago. This period of time he cannot undertake to say is a sufficient test of its complete success. Still he shows that it has stopped decay, and that no signs whatever of decomposition appear in any portion of the surface of the stone subjected to the process. This is a good groundwork on which to base the results of further experiments.

THE SMOKE QUESTION.

THE Prize Essay by Mr. Charles Wye Williams, C.E. to which the special gold medal of the Society of Arts was awarded, has been published by Weale, of High Holborn.* In this treatise on the Smoke Question, the subjects discussed, in accordance with the scheme of the Society of Arts, comprise a review of the various plans put forth as remedies, with an account of their success or failure, and their results as respects expense or economy; the legislative measures necessary, and the causes of failure in local Acts; and the best means of preventing the nuisance of smoke itself.

The author, in his introduction, remarks that he offers no new theory,—no new view of the nature of combustion, and that he draws no inference that is not in strict accordance with the highest chemical authorities, and with the results of successful experience. He very properly endeavours to reduce the question strictly to the nature of a chemical problem to be solved, and that solution he finds simply in the sufficient access of air—cold air—to the fuel during combustion.

"We see," he remarks, finally, "that the cause of the formation of smoke is, the absence of the proper supply of air to the combustion of the gas (the only combustible that it contains), *at the time when from its high temperature of incandescence* it was best fitted to receive it. So long then as due consideration to the providing for the admission of this supply of air to the furnace, at *the proper time* and in the proper quantity, be but little attended to; and that our practical engineers regard the question as of secondary importance, or almost with neglect; we cannot expect any reformation of the system of furnace details and arrangements."

In enumerating the patents in which the principle of introducing the air direct to the gases in the furnace by jets, films, or otherwise divided streams, forms the basis of these respective so-called inventions, the author remarks that it is "sufficient to know that the principle is daily gaining ground, and will shortly supersede the necessity for legislative interference. Thus this class of patentees, imitators

* Prize Essay, "On the Prevention of the Smoke Nuisance." By C.W. Williams, Associate Inst. C.E. Weale, 59, High Holborn. 1856.

though they be, are, nevertheless, working unquestionable benefit to the public, by adopting the right mode of introducing the air, and thus effecting combustion without the production of smoke. For the present, however, and until the subject is more generally understood and the principle adopted, *not by patentees, but by the makers and designers of boilers*, the improved practice must be effected at the expense of those who are compelled to have recourse to such agency, to avoid the penalties harshly and even unjustly imposed under the provisions of the existing law."

Although the author appears to handle his subject in general both ably and correctly, his anxiety to place it entirely and strictly on scientific, or chemical grounds, to the neglect of popular meaning and ideas, may be occasionally considered to lead him *unnecessarily* into an appearance of mistake, himself, which may betray some of his readers into actual error, both as to his real objects and as to the subject on which he treats. Thus, in pointing out that "blacks," or in fact soot, is a product or result of imperfect combustion, and that the gases and vapours which arise at first in adding coal to an ordinary fire, already burning, contain no such result, but consist of *combustibles not yet burnt* even into "blacks," he speaks always of these "blacks," while yet undeposited, as *being*, exclusively, "smoke," the combustible gases and vapours contradistinguished from it not being smoke at all, and this because, "according to the views of scientific men, the term smoke is applied to the volatile *produce* of the furnace *after* the process of flame or combustion has taken place, in contradistinction to *that* which issues direct from the coal, and which is called gas, or gaseous vapours." Now, whatever scientific men may mean by "smoke," what the public desire to get rid of as a nuisance in the atmosphere is not merely the "blacks," which Mr. Williams and the scientific men call "smoke," but of those very gases and vapours also which these gentlemen tell them are *not* "smoke," but which the public insist upon calling smoke, or at least upon comprehending under the term "smoke nuisance," as part and portion of that very contamination of the atmosphere which they desire and require to get rid of, and which, in fact, Mr. Williams, in accordance with that desire, shows how best, in his opinion, to get rid of. The combustible carburetted hydrogens, sulphur, and other substances which rise from fires immediately when fresh coals are put on, are far more noxious to human beings than even the "blacks," soot, or "smoke," with which every townsman's lungs are well known to be blackened for life; and if a whole people will insist upon calling that "smoke," scientific men and Mr. Williams ought just to submit to the infliction, correct their own definitions, and make the most of them. As it is, the best mode of burning completely these noxious gases and vapours, so as at same time to prevent the *production* of blacks, is in effect what this very able and valuable treatise precisely treats of.

"GROUND TO LET."

IN an account of a bankrupt's final examination, recently published, it appears the petitioning creditor, who was the mortgagee of nearly all the bankrupt's property, had agreed to lease some land to the bankrupt, had induced him to expend 4,000*l.* of his own money on it, to get largely into debt in covering the land, and had proposed to the bankrupt to assign the whole of his property to him, and then to go through the Bankruptcy Court, promising him, after he should have obtained his certificate, to give him "1,000*l.* to begin again" with.

Without going into the truth of this matter, it would be a great benefit to the building trade if you would warn them against such machinations, as it is well known there are many who press upon poor and industrious builders, and serve them in the same way. The plan adopted by these worthies is to take a large plot of land, and then underlet it, not by advertising, but by getting an agent for building materials to "look up" customers at a premium of from 1*l.* to 3*l.* per plot. He meets with an industrious man who has been a few years in business, and has hitherto paid his way and is in tolerably good credit; and as a great secret to the victim, tells him a friend of his has some very eligible land to let, and that he (the agent) will introduce him; that he can get him a couple of houses to build at a fair price if he will take ground for six; and that his (the agent's) friend will advance from 75*l.* to 80*l.* per cent. on the buildings, which will be sufficient to finish them, as he (the agent) is in a position of getting his (the builder's) materials for him at a cheap market—will be happy to serve him in that or any other way, and will make no charge for his services; but if he (the builder) can come to terms with his friend, and can afford a few pounds out of so good a thing, he will "of course" take it. This is often paid on the signing of the agreement, the usual fee being 5*l.* from the poor builder, and 1*l.* per house from the landlord. The builder begins his operations, and if able to finish the first pair, and let them, the landlord advances on the leases, and so keeps on until all his (the builder's) money and credit are exhausted, and then advises him, through the agent or by himself, to go to the Bankruptcy Court, with a promise to make it all right when he has passed through the ordeal.

If all the builders who have passed through the court for the last ten or fifteen years dared to make it known, three-fourths of them would acknowledge the truth of these statements.

ONE OF THE VICTIMIZED.

MODE OF EFFECTING PARIS IMPROVEMENTS.

IT will be recollected that, some time since, a committee of the Society of Arts was appointed to take up this subject, with a view specially to obtaining information as to the manner in which the improvements in the streets of Paris were effected. Information relative to the mode in which the legal proceedings connected with the compulsory taking possession of private property for such purposes, has been obtained, and is published in the Journal of the Society, for September 5,—No. 198.

The law of France is based on the following general considerations.

Undertakings for the public good involve private interests in a certain amount of sacrifice, though they share in the general profit and advantage arising from them, and regulations to meet this view are accordingly adopted. Some of these regulations relate to the mode in which such parties should share in the expenses and profits: others refer to compulsory taking of land; and again, some others refer to injuries affecting the property and rights of individuals, and to the compensation they may be entitled to. In certain cases, public works may be undertaken for the benefit of private property. They may likewise be useful and beneficial to a limited number of proprietors. The duty of the public administration* is, in both cases, to superintend the execution of such works, and to procure, or, at any rate, to enforce regularity in the working by all parties interested therein. The outlay is equitably divided among those who are to profit by such works, and in proportion to the benefit accruing to them therefrom.

MEDIÆVAL MONUMENTS AND BRASSES.

AT a meeting of the Worcester Architectural Society and of the North Oxfordshire Society, held at Banbury, a few days ago, the Hon. F. Lygon, as mentioned last week, read a paper on "Mediæval Monuments, and particularly Brasses," in the course of which he said the earliest records of those departed in Christ were to be found in the Catacombs of Rome, and there, few were met with earlier than the eleventh century. In that and the two following centuries, stone coffins began to be used in memory of the noble and rich, which were fixed in the pavement of churches where the departed were resting. These slabs were sometimes incised with designs more or less elaborate, and to these incised slabs they might refer the origin of brasses. The slabs were gradually raised from the ground, at first perhaps a coped stone coffin with a cross sculptured thereon; and this variety of monument, with the addition first of panelled sides; then of niched sides with figures; next a light canopy, which, developed more and more, swelled into the full and perfect majesty of a mortuary chapel inclosing within it an altar tomb. It was to the first-mentioned variety of monument that he particularly called their attention. He claimed for our national taste the almost sole encouragement of monumental brasses,—a grateful and enduring method of preserving to posterity the features and appearance of our ancestors. Glasgow cathedral boasted of owning the only brass in Scotland: in Wales, there are few known to exist,—one from St. Thomas's chapel, St. David's, now the Chapter-house; one to Sir Hugh Johnys, at Swansea; one to Gwenllian Walsh, at Llandoughi; at Llanrwst, in Denbighshire; and some to the Gwydr family, now represented by Lord Willoughby D'Eresby; one at Dolwyddelan, in Carnarvonshire; one at Usk, in Monmouthshire; a wretched little thing at Haverfordwest; and one somewhere on the borders of Herefordshire. These are all that now exist in Wales, but at St. David's are the matrices of four others, one of which, on the altar tomb of Edmund, Earl of Richmond, must have been on a grand scale. In St. Patrick's, Dublin, there are three. There were some at Bruges, one at Amiens, a few at Aix-la-Chapelle, some in Meissen cathedral, one at Seville, one at Constance, which is believed to have been sent from this country; there are a few at Funchal, Madeira, some in Denmark, and a very fine rubbing from a magnificent brass at Lubeck exists in the collection of the Oxfordshire Society. The earliest kind of brass was known by the name of "Limoges Enamel," and which was used half a century before 1200,—the earliest date recorded of any brass properly so called. The art of enamelling metals was introduced into Europe through Byzantium and Venice, and its principal manufacture settled at Limoges, whence the above name. In this country it was first used to adorn the tomb of Walter de Merton, founder of Merton College, and Bishop of Rochester. These Limoges enamels led the way to the use of incised slabs of brass let into stone, and these, ecclesiologists have agreed to call "brasses." The earliest brass of which the design was known, was that of Philip and John, sons of Louis VIII. of France, who reigned from 1223 to 1226. The earliest brass we read of in England was that of Simon de Beauchamp, Earl of Bedford, who died 1208, and was buried in St. Paul's, Bedford. There were also records of brasses to Jocelyn, Bishop of Wells, who died 1242; Bingham, Bishop of Sarum, 1247; Richard de Berkyns, Abbot of Westminster, 1246; but the earliest brass extant in England was that of Sir John d'Abernon, 1277, in Stoke d'Abernon church, in Surrey,—the only whole-length military example, of the reign of Edward I. which was not in cross-legged attitude, and the only effigy that remains of a knight armed with the knightly lance.

* "*Administration Publique*" applies to public authorities of all kinds, whether municipal or governmental.

BATHS AND LIBRARY FOR THE CITY OF LONDON.

WE have so long heard of public baths and libraries for the City, that the idea of their ever being really erected, seems most improbable, although we are told by the newspapers, and upon every possible opportunity of lauding our generosity, that every want is cared for in this country. (?) The ninth of November will soon be here again, when a lord mayor might possibly be elected who will forsake the beaten tracks of his predecessors, and call a meeting to erect baths and wash-houses, and a library, the expenses to be defrayed partly by subscription, and a rate to be levied upon the whole of the City, the baths, &c. being erected in as central a position as can be obtained, so as to be within walking distance from any point, standing, as the city does, only on a square mile of land. The expense would then fall lightly upon all, as there are so many rich owners and occupiers, either living or trading within its boundaries, who would doubtless subscribe liberally, leaving but a comparatively small sum to be collected, which could easily be raised by a union of all the parishes within the City; 20,000*l.* or 25,000*l.* being a mere bagatelle to collect for so useful an object from the merchant princes of England. There is plenty of work for the builder to do in every part of the City, which requires a better method of improvement than the present dilatory system, the welfare of the present generation being of as much consideration as any other. There is an alderman, once in the trade, who, should he live to fill the office of mayor, will, I trust, prove a "brick" in making improvements.

A. Z.

GLASGOW CATHEDRAL.

A MEETING was held in Glasgow, on Thursday in last week, as to finishing the renovation of this structure, the only one in Scotland which escaped destruction at the Reformation. Till about fifteen years ago, it remained almost entirely neglected; but the Commissioners of Woods and Forests (to whom the cathedral belongs), urged by the citizens, and assisted by the corporation of Glasgow, have since then restored the fabric, at a cost of about 17,000*l.* of which the city have contributed nearly 3,000*l.* The restoration was coming to a close, and it was deemed incomplete unless the windows were filled with stained glass in the highest style of art. A subscription was accordingly organised on the plan that each contributor should fill in one window, and has been very successful. The four principal windows, which will cost from 800*l.* to 1,000*l.* each, are to be filled in respectively by the Government, the Trades House of Glasgow, the Duke of Hamilton, and the Messrs. Baird of Gartsherrie, the wealthy ironmasters. There are upwards of forty smaller windows, the filling in of which will cost about 120*l.* each, and these have been taken up by the Duke of Montrose, the Duke of Buccleuch, the Earl of Eglintoun, the Earl of Glasgow, Lord Douglas, Lord Belhaven, the great majority falling to the share of private citizens of Glasgow. The meeting of Thursday was the first meeting of the subscribers. The Lord Provost was in the chair. The Duke of Hamilton moved the first resolution,—"That it is desirable to complete the restoration of the cathedral of Glasgow by filling the

whole of the windows with painted glass. The Duke of Montrose moved the second—"That it is desirable that the subscribers to this interesting and important undertaking should unite in promoting the adoption of a harmonious plan of decoration, suitable to the character of the building, and worthy of the purity and dignity of its architecture." Mr. Stirling, of Keir, M.P. moved the third resolution, to appoint a committee to procure information as to the best means of carrying the foregoing resolutions into effect, and to communicate the result of their inquiries to the Government, and to the subscribers. The resolutions were all unanimously adopted. The Lord Provost afterwards complained, that in the newspapers of late, his name had been freely used in connection with this matter, totally without his sanction. He had been applied to by great numbers of glass-stainers both in this country and on the continent, and the universal answer he returned was, that nothing could be done till a committee was appointed to investigate and report on the whole subject.

THE ARCHITECTURAL ASSOCIATION.

It would be very desirable if our committee of the Architectural Association would shortly inform us through your columns of their views respecting the proposed amalgamation with the Institute of British Architects, as we should be given time to reflect over it much better than by a sudden discussion on its merits at a general meeting, when we could have had no time to study it. Considering the very great service which it will prove to all the junior members, and, indeed, to architectural art in general in the metropolis, I certainly think that sufficient time ought to be given to the members to consider the means proposed to obtain it. We shall no longer have our energies cramped by the idea that the Association has any pecuniary difficulties to trouble it, while the fine library to which the junior members will obtain access, will not only prove of incalculable benefit to them, but induce vast numbers to join our body, who, by reason of the want of this, have held aloof. As a junior member of the Architectural Association, I do earnestly trust that our committee will not, from any desire of office, throw difficulties in the way of what they must see to be so eminently for the general benefit. At the same time there can be no doubt that the junction would be very much facilitated if the Royal Institute of British Architects would give some idea of the terms they would accept, instead of leaving the Association to propose what possibly might be immediately rejected. We must not, however, shut our eyes to the fact, that if the Institute really wish to make the Association part of itself, and at the same time retain and improve its practical use, it must lay down towards it a liberal policy in dealing with it, so as to retain its vigour unimpaired. If this plan is adopted, nothing but blundering on the part of the leading body of the Architectural Association can prevent this most desirable result, and doing otherwise would, in a comparatively short time, produce the ruin of the society.—J. T. Irvine.

RECENT AMERICAN PATENTS.

We glean the following from the lists of recent United States patents in the *Journal of the Franklin Institute*, of Pennsylvania:—

For an Improvement in Cast-iron Pavements: Asa P. Robinson, City of New York.—Claim: "The cylindrical form with the tangential flat surfaces raised upon its circumference, for contact between the blocks. Also, the peculiar manner of keying the blocks together, and of keeping the blocks to the rails, to prevent vertical motion, and to admit of any one block or rail, or any number of blocks or rails, being moved without disturbing others not required to be moved, by means of the triangular formed spaces, the rebates and the keys, or by means of the projecting surfaces of the blocks, and the flanches or lugs on the rails and the key."

For an Improvement in Bridges: George W. O. Huggens, assignor to self and Charles Bender and D. F. Tiedman, St. Louis, Missouri.—Claim: "The combination of and between those mechanical agencies and technical parts which constitute the mode to prevent vibration in a bridge by using the compensated effect of compression only. Also, the combination of and between the mode in which the arches are arranged, and across each other, and the mode in which they are connected with the flow; and, finally, the mode in which they receive their leverage, the mechanical effect of which said combination is to originate the tendencies in the upper and lower arches to curve apart or asunder. Also, the combination of and between the mode in which the arches cross each other, and the mode in which they are connected with the floor; and the mode finally, in which they are constructed, in regard to amount of material, the mechanical effect of which said combination is to originate the equal intensity of the said tendencies. Also, the employment in the bridge construction of the arches, as a practical substitute for upper cords, and generally, for all such parts in bridges which serve to uphold the floor. Also, the special mode in which the arches are connected with the floor."

For an Improvement in Repairing Railroad Bars: James M'Lellan, Detroit, Michigan.—Claim: "Placing the rail or bar to be heated within a cooler, which is fitted within the furnace, and supplied with water from a reservoir at the outer side of the furnace—the cooler being so formed or arranged, as to encompass or be in contact with the parts of the rail bar not designed to be heated."

For an Improved Machine for Bending Wood: Edward J. Updegraff, York, Pennsylvania.—Claim: "The peculiar method of operating the form upon which the wood is bent, by bringing it hard down upon the platform by means of the screws, and giving it motion by means of the platform beneath it (whether endless chain or otherwise), separately and in connection with the arrangement of the wheels, the screw, the spring, the frame, and the slide."

For an Improved Mortising Machine: Edward Joslin, Keene, New Hampshire.—Claim: "Combining or arranging with the tri-armed sectional lever, and the post or frame of the tool carriage, two wooden springs and a connecting rod, so that one spring may be separated by draft, and the other by pressure, when said lever is placed downward."

For an Improvement in adjusting the Angles in Machines for Sawing Marble Obelisks: Lebbius Brookes, Great Falls, New Hampshire.—Claim: "The peculiar combination of mechanism, by which each of the saw frames is moved relatively to the other, and so as to dispose its saws either in or out of parallelism with those of the other, as circumstances may require—the same consisting of the upright rod, the bell crank rod, their slides, staple guides—the same being applied to the main frame and the saw frame. Also, combining with each of the bell-crank shafts and the rod, and each of the saw frames, and its suspension-rod, the movable frame, whereby said suspension-rods are adjusted or moved, at their lower ends and in the same directions."

For an Improvement in Machines for Sawing Marble in Obelisk Form: J. E. Haviland, Galveston, Texas. — Claim: "Adjusting the saw-frame, F, more or less angularly or obliquely with the saw-frame D, by means of the adjustable or sliding plates, which are fitted over curved surfaces on the cross pieces of the frame."

For an Improvement in Machines for Sawing Marble in Obelisk Form: James Miller, Buffalo, New York.—Claim: The combination of the crank shaft, mounted above the saw frame; the loosely-jointed pitman, and the rocking bars, vibrating on fulcra upon the adjustable frames which guide the saws."

For an Improved Planing Machine: Cyrus B. Morse, Rhinebeck, New York.—Claim: "1. The combination of the following mechanical elements: planing cylinders, line plate, beds or rests, and weighted levers, when arranged and combined for reducing a board to an equal thickness, without bending the same.—2. Making the edge of the bed a cutting instrument, and giving said bed or rest a longitudinal movement, simultaneous with the swinging back or forward of the cylinder, so that the edges of the cutters on the cylinder will preserve the same relative position, with respect to the cutting edge of the bed, in all positions which the said cylinder may occupy.—3. Giving the line-plate a tilting motion about its own axis, to present its flat surface to the board under all circumstances.—4. Maintaining the pressure on the middle of the board, irrespective of the portion of the cutters to which the board is submitted, by means of the weighted levers."

For an Improved File-Cutting Machine: James L. Norton, Alum Bank, Penna.—Claim: "1. Hanging the worm-wheel shaft in moveable bearings, so the worm may be disengaged from the feeding rack, without stopping its motion to do so, for the purpose of allowing the carriage to run back and be set for the next series of nicks. Also, in combination with the moveable shaft, the adjustable projection and levers, for first holding and then disengaging the shaft, to admit of its swinging. Also, in combination with the sliding carriages, the projection and adjustable former, for keeping the blank at a uniform distance from the nicking tool, for the purpose of equalizing the force of the blow, notwithstanding the taper of the blank. Also, the use of the spaces for regulating the force of the spring upon the nicking tool."

For an Improvement in Machines for Sawing Marble Kerfs of Varying Angles: Samuel Nickelson, Pulaski, Tennessee.—Claim: "The adjustable or sliding bars, when said bars are curved or bent, so as to form saw-frame guides, in combination with the pivoted pitmans and eccentrics on the shafts, whereby the saw frames and the devices for drawing them ar all attached to and move with the bars; thereby allowing the saws to be adjusted more or less angularly with each, and at required distances apart, with the greatest facility."

For an Improvement in Scaffolding: John M. Dearborn, Boston, Mass.—Claim: "This improvement in the construction of moveable scaffolds, which consists, first, in constructing the upright standards of two planks or boards, leaving a space between them, in which space the ledgers can be moved up and down, and secured in any desired positions. Also, constructing the upright standards with tenons on the top, which fit into the bottom space, strengthened by an iron sleeve between the planks of the upright standards of the next upper section, whereby I am enabled to extend the stageing vertically."

For an Improved Mode of Constructing Portable Houses: Daniel Fitzgerald, City of New York.—Claim: "1. The constructing houses of staves, held together by hoops.—2. Combining the staves in segments or parts of the periphery, some of which shall combine the doors and windows, to facilitate the putting up and taking down.—3. Constructing the floors in segments.—4. Sustaining the thrust of the roof by a hoop, which also confines the staves."

For an Improvement in Preparing Artificial Stone: Robert Neisch, City of New York.—Claim: "The preparation of artificial stone, by treating plaster of Paris, previously calcined, together with sulphuric acid, with solutions of alum and carbonate of ammonia."

BUILDERS' BENEVOLENT INSTITUTION.

A meeting of the Committee and Directors of this useful charity was held at the office of the institution, Southampton-street, Bloomsbury-square, for the purpose of taking into consideration the propriety of having a fresh election of pensioners, and upon other business. Mr. T. Cozens presided.

The chairman having stated the object for which they had been called together, said that their new President, Mr. Alderman Lawrance, would preside at the ninth anniversary of the foundation of this institution, which was fixed to take place at the London Tavern, on the 29th of October. He hoped that the trade in particular would well support Mr. Lawrance, and respond liberally to the appeal on the part of the charity, so as to enable the committee to have it in their power, as on the last occasion, to elect a larger number of candidates.

Mr. Thomas Scantelbury proposed, and Mr. J. Williams seconded, a resolution to the effect that an election of pensioners take place on Wednesday, the 27th of November.

Mr. G. Bird trusted that the builders generally would support their new president at the following anniversary festival, and by that means raise a sufficient fund to take in the whole of the candidates. He hoped that all who could would become stewards; for if they did that, and each one used his best exertions, he felt confident that they could raise money enough to relieve some of the poignant distress that was now existing.

Mr. G. Grayson always heard with pleasure of another election of candidates, and trusted that gentlemen would not relax in their exertions, but would endeavour to make this institution one of the first in the kingdom.

Mr. Joseph Bird said it behoved all those who were prosperous to make provision for the comfort and happiness of their less fortunate brethren. On the last occasion, the result of the dinner was so satisfactory, that they were enabled to elect six candidates instead of two, and he hoped that the same gratifying result would attend the advocacy of their new President at the forthcoming anniversary festival.

The Chairman then put the motion, which was carried *nem. con.*; and after the transaction of some other business, the meeting separated.

Notices of Books.

Monumental Memorials. Part I. By J. W. Hallam, Architect. London: Masters. 1856.

Here we have thirteen designs for headstones and four for mural monuments, drawn with a free hand and some affectation. A few of the headstones show an admixture of iron and stone, an uncertain union, unless very cleverly performed. The author, Mr. Hallam, in his brief introduction, makes a suggestion. He says,—

"In the case of a new church, where it is desired to place a memorial, the architect will be the proper person to design a monument in accordance with the style of the building, and if possible, to arrange for it to form part of the design, so as not to mar but add

to the effect. Suppose, for instance, that the walls of the church are of brick, uniform in colour, not plastered: a good effect might be obtained at a trifling cost by arranging in the bond of the brick-work for bricks of a different colour, to form an ornamental cross, inserting a block of stone at the foot, on which to carve the inscription, the letters of which should be painted and gilded. Such an arrangement must of course be considered before the wall is built, so as not to interfere with any objects which may surround it."

VARIORUM.

Murray's "Handbook for Wilts, Dorset, and Somerset," alluded to last week, is a branch of so large a family with a good reputation, that it needs no praise from us. It will be found of the greatest value by tourists, and, moreover, tells of such an interesting part of the country, that it is a readable book for those who stay at home. In a work of this sort errors will creep in; and we may note for the next edition, that the north door of Bridgwater Church is of the Geometrical period, not Norman; that Yeovil Church is Perpendicular, not Decorated; and that the paintings above the altar at St. Mary Redcliffe, Bristol, have been removed some time.——Some may thank us for saying that *The Ecclesiologist* for August contains a letter from M. Lassus, the eminent French architect, in defence of the motto adopted by him in the Lille competition,—"Eclecticism is the Affliction of Art."——Carlyle would make our architecture very lively. In Mr. Waldo Emerson's "English Traits," just now published by Routledge, a very agreeable set of sketches, showing much but not quite enough knowledge of us, the philosophic American describes a visit to Stonehenge with the writer we have named. Recording some of Carlyle's observations, Emerson says, "In these days, he thought, it would become an architect to consult only the grim necessity, and say, 'I can build you a coffin for such dead persons as you are, and for such dead purposes as you have, but you shall have no ornament!'"—on what reasonable grounds it would seem hard to say.

Miscellanea.

PURE WATER AND HEALTH.—At the late meeting of the British Association, Dr. Lankester exhibited some water taken from a well at Cirencester. The water from this well had been the cause of illness in a family which had partaken of it. Although at first clear, after standing a little time it exhibited the mycelium of a fungus. This water had been sent to him for examination, and he had been struck with the resemblance of the fungus to that of one which he had found in the well-water of Broad-street, Golden-square, the drinking of which had been undoubtedly connected with the outbreak of cholera in that district in 1854. This well had subsequently been found to have received into it the contents of house-drainage. He had now discovered that the well at Cirencester had also received into it a certain amount of house-drainings. He related other cases in which fungi appeared in contaminated water. None of the waters mentioned exhibited any injurious constituents that could be discovered by chemical analysis. Before chemistry could detect them they had lost their injurious properties, and the microscope alone could realize their presence.

GAS.—The Cardiff Gas Company have declared their usual dividend of eight per cent. The company are rapidly extending their works on all sides.——The directors of the Montrose Gas Company have resolved to reduce the price of their gas from May last to 5s. 6d. per 1,000 feet, being the lowest price at which this article is supplied within any of the neighbouring counties of Forfar, Aberdeen, or Perth, excepting the town of Dundee, where the price is somewhat lower.——A company has been recently started, under the law of limited liability, called the British Portable Gas-Apparatus Company. The capital is 40,000*l.* divided into 4,000 shares of 10*l.* each. The objects of the company, says the *Morning Herald*, are to bring into general use a new and improved portable gas-apparatus, patented by Mr. Abram Longbottom, a civil engineer, and with whom a satisfactory arrangement has been made for the transfer of the rights taken under his patent. It is stated that the apparatus for producing the gas is one of a most simple construction, and we find that a silver medal has been awarded for the invention by the American Institute. By this plan gas, it is said, can be produced in private mansions, manufactories, hospitals, and other isolated buildings, at a trifling cost.

AMALGAMATED SOCIETY OF ENGINEERS.—The members of the Manchester first branch of the above society celebrated their anniversary dinner on the 30th of August, at the house of Mr. Campbell, Land o'Cakes, Great Ancoats, when upwards of seventy sat down to dinner. The district secretary stated that the society paid last year nearly 20,000*l.* to its members for want of employment, sickness, superannuation, funerals, and accidents, thereby showing benefits which, he said, no insurance company in the known world could offer, at the same amount of subscription.

AUSTRALIAN COPPER.—The mercantile report of Messrs. Macdermott, Dutton, and Co. of Adelaide, states that at the Burra Burra mine, in the six months ending 31st March, 1856, 6,450 tons, estimated to contain an average of twenty-seven per cent. of copper, were raised. The cost of produce is estimated at about 8*l.* per ton. This mine commenced working in April, 1845, with an original capital of 12,010*l.* in 5*l.* shares. Since that period there have been raised 109,005 tons of copper ore, which produced 2,000,000*l.*; and twenty-six dividends, amounting to 418,880*l.* or 170*l.* for every original 5*l.* share has been already paid to the shareholders, and in addition to the latter, there is an undivided profit of 208,854*l.*; making the gross profit in ten and a half years 627,734*l.* A vastly increased quantity of copper might be raised, were it not for labour being withdrawn to the Victoria gold-fields. The entire staff of the Burra Company comprises only 688 persons. The copper and copper ore exported from the colony during the last season were valued at 500,000*l.*

PROJECTING CORNICES IN STREETS.—I beg to be allowed to call attention to what appears to me to be not only a piece of useless expense, but offensive to good taste—in city building. I allude to the enormous cornices which it appears to be the present fashion to adorn warehouses &c. with. In wide streets, where the parapet can be seen above the cornice, it may be all very well; but what necessity can there be so to crown a warehouse in a narrow street? If one of the elements of beauty consists in utility, then it is surely wrong, and as it must tend to darken the narrow street, and has been attended with considerable danger, in more than one instance, it cannot be right. You will, no doubt, remember the sad accident in Wood-street, Cheapside, that occurred during the erection of a warehouse, when some 20 or 30 feet of the cornice fell, smashing the scaffolding, and killing either a man or a horse. In such a thoroughfare it was fortunate more lives were not lost.—R. S. T.

THE MANCHESTER EXHIBITION BUILDING.—The length of the building is now clearly shown, the terminal walls, front and back, being some 25 feet above ground. There is an immense quantity of building material spread upon the site, at the points where it will be wanted, consisting of iron, wood, and bricks. Nearly 1,000,000 of bricks have already been placed. The timber and bricks are supplied by Messrs. Bennet, of Ardwick. As giving some idea of the quantity of wood required, the following items may be mentioned: 8,400 joists, 12 feet long; 2,000 ditto, 8 feet long; 140,800 boards, 12 feet long, 1¼ inches thick; 265,600 ditto, 12 feet long, ⅞ of an inch thick; 25,000 scantlings, 12 feet long, 4 inches by 3 inches; and 10,000 ditto, 3 inches by 3 inches. This gives a total of 451,200 pieces; yet the only woodwork visible will be the floors.

HISTORY OF THE STEAM-ENGINE.—I am led to send the following extract from the fortieth chapter of Gibbons's "Decline and Fall," &c. for insertion in the *Builder*, by reading a history which passes from the days of Hero to the twelfth century of our era, and which affirms that in the interval "history is a blank" as to any notices of the "developement of the power of steam."—E. C. S.

"In a trifling dispute relative to the walls or windows of their contiguous houses, he" (Anthemius, architect of the Emperor Justinian) "had been vanquished by the eloquence of his neighbour Zeno; but the orator was defeated in his turn by the master of mechanics, whose malicious though harmless stratagems are darkly represented by the ignorance of Agathias. In a lower room Anthemius arranged several vessels or cauldrons of water, each of them covered by the wide bottom of a leathern tube, which rose to a narrow top, and was artificially conveyed among the joists and rafters of the adjacent building. A fire was kindled beneath the cauldron: the steam of the boiling water ascended through the tubes: the house was shaken by the efforts of imprisoned air, and its trembling inhabitants might wonder that the city was unconscious of the earthquake which they had felt..... The orator declared in tragic style to the senate that a mere mortal must yield to the power of an antagonist who shook the earth with the trident of Neptune," &c.

⁂ The anecdote is well known, but may interest some of our younger readers.

INTELLIGENCE FROM JERUSALEM.—The building which the Austrian Government erects in this ancient city for the reception of 100 pilgrims and voyagers, has been of late commenced, under the superintendence of M. Endlicher, the Vienna architect. When excavating the foundation the workmen arrived at some large stone-slabs, most probably belonging to the ante-Roman (Hebrew) period. Farther on a subterraneous church (*crypt*) was discovered, which served, probably, the first Christians for a religious hiding-place. It is entirely built of stone. M. Endlicher and some other persons then entered a series of caves, through which they passed for some considerable time, but have had no leisure to examine them yet. Still, all these discoveries will successively clear up the topography of ancient Jerusalem; the more so, as the present Pacha is a man willing to give encouragement to every such enterprise. School-houses, hospitals, and even places of public resort, casinos, &c. are constantly springing up in this town. A railroad is also spoken of; at any rate, a good Macadamized road would much increase the number of European visitors.

COLCHESTER BURIAL-BOARD.—The Board, in a report from the Building Committee just now published, accuse the architect whose design was selected, of reducing the design for execution, so as to bring it within the desired cost. They say:—"The contract entered into between the Board and Messrs. Colls and Co. provided for an outlay of 1,865*l.* for chapels, lodge, receptacle-house, and entrance-gates. To this was to be added the cost of erecting the eastern boundary wall, which would raise the expense of the work to be performed by the contractor to about 2,200*l.* Soon after the commencement of the works, it was discovered that Messrs. —— and ——, the architects, had so reduced and altered the working drawings that they very inadequately represented the drawings to which the premium had been awarded. This defalcation on the part of the architects rendered it necessary to make many important additions to their mutilated plans, involving, of course, a heavy outlay in the shape of extras."

THE DUPLICATE RETORT STEAM-BOILER.—Recent explosions have led Messrs. Dunn and Co. to bring into notice their Patent Duplicate Retort Steam-boiler. The main advantages that have been sought by the patentees are to render an explosion more difficult, or if it does take place, to diminish the mischievous effects, by giving it only a partial character. These results are proposed to be attained by the substitution for the present steam-boiler, of a number of cylinders or retorts about 10 feet long, and 19 inches diameter, composed of ½-inch best wrought-iron Staffordshire plates, with strong cast-iron ends, forming the pipe junctions. These cylinders or retorts are placed in parallel lines, and the water supply-pipe is connected with one end of each by a short pipe or neck, through which the water is pumped into all the cylinders, which are generally kept about half full. The water is converted into steam in the cylinders, and the steam passes from the cylinders (on the opposite side from whence the water supply is obtained) through a tube into the steam-chest, and from thence the steam becomes a motive power, and its action is intelligently directed. The fire plays underneath and over the cylinders in a sinuous manner. One great economical advantage is claimed; that in the event of explosion only one cylinder may be affected, and not, as in ordinary cases, the entire boiler.

RAILWAY TRAFFIC.—The traffic returns of railways in the United Kingdom, for the week ending August 30, amounted to 478,999*l.*; and for the corresponding week of 1855, to 461,732*l.*; showing an increase of 17,267*l.* The gross receipt of the eight railways having their termini in the metropolis amounted, for the week ending as above, to 209,737*l.*; and for the corresponding week of last year to 202,100*l.*; showing an increase of 7,637*l.* The increase on the Eastern Counties Railway amounted to 397*l.*; on the Great Northern to 368*l.*; on the Great Western to 2,246*l.*; on the London and North-Western to 2,958*l.*; on the London and Blackwall to 94*l.*; on the London, Brighton, and South Coast, to 142*l.*; on the London and South-Western to 1,651*l.*: total, 7,856*l.* But from this must be deducted 219*l.*—the decrease on the South-Eastern—leaving the increase, as above, 7,637*l.*

FALL OF A CHIMNEY.—The colossal chimney attached to the vitriol works of Mr. Jones, at Victoria-quay, facing the Royal Barracks, Dublin, suddenly fell on Thursday week, levelling with their foundations several high walls in its vicinity, and breaking down the greater portion of a long slated shed, fortunately, however, without doing the slightest personal injury. This chimney, which had long been known as the largest as well as the loftiest in Dublin, was built twenty-four years since: its dimensions were—height, 150 feet; circumference, from 60 to 70 feet; and internal diameter, 24 feet.

THE WESTMINSTER CLOCK BELL.—At the time of our former notice of this bell it had not been weighed. The weight is now stated to be 15 tons 18 cwt. 1 qr. 22 lbs. or 16 tons within a small fraction. The thickness is found to be rather more than was stated in our former notice—viz. 9⅜ inches at the soundbow, where the hammer strikes, and 3⅜ in the upper part, being very nearly 1-12th and 1-36th respectively of the diameter at the mouth, 9 feet 5½ inches. The great bell had to be sent down from Norton to West Hartlepool by railway on Sunday, being too wide for any train meeting it to pass. The composition is 7 of tin to 22 of copper, melted twice over, as in speculum metal, to secure a perfect alloy. The metal is nearly as hard as spring steel, and much harder than is usual in modern bells, in which the proportion of tin is less than in the best old ones. When the bell arrives at Westminster, it is to be hung for trial at the foot of the clock tower, with a clapper of half-a-ton, to be pulled by five or six men. It is finally to be hung in the open part of the spire of the tower, which was made for the purpose, in order that the sound may issue without obstruction.

NORFOLK AND NORWICH ARCHÆOLOGICAL SOCIETY.—A meeting of the members of this society was held on Wednesday in last week, at Yarmouth, and excursions were made into the neighbouring parishes to inspect the churches, and to Caister Castle. The Mayor of Yarmouth (Mr. Palmer, a good antiquary), received the members at the Town Hall, and delivered an address on the robes and regalia of the corporation. The party then visited Caister Castle, and the churches at Mautby, Filby, Burgh, Rollesby, Martham, and Ormesby. At Caister Mr. Harrod read a paper descriptive of the place, with pictorial representations and plans. On the return of the party to Yarmouth, about fifty went to the Assembly-room at the Town-hall, where a cold collation was provided, the Mayor in the chair.

THE NEW PARK OPENED AT BIRMINGHAM.—The Adderley-park, just opened, is in the Adderley-road, about two miles from the centre of the town, and within an easy distance of the Saltley station, on the Midland Railway. It covers an area of ten acres, lying between St. Saviour's church and the extensive works of Brown, Marshall, and Company. The grounds are arranged, a gravel walk traversing the circuit of the park, with a row of lime-trees planted along the sides. The entrance to the park will be through a lodge, to which is attached a large building, designed by Mr. Street, of Oxford, in which apartments will be appropriated to the purposes of news and refreshment rooms, a library, and a general museum. The building had been erected by Mr. Adderley, but the expense, amounting to more than 1,000*l.* will now be defrayed out of the proceeds of the recent bazaar in the Town-hall. The building is nearly completed.

LONDON SLAVES.—Mr. Lilwall, of the Early Closing Association, has addressed a letter to us on the frightful drudgery to which assistant chemists are condemned, and makes out a strong case for reform. "Eight o'clock ought, by all means, to be the hour of closing, as the time thus rescued from the shop would be available for some really useful purpose: it would, for instance, afford opportunity to members of the business to attend scientific lectures, and to prosecute such other studies as are essential to the completion of their general, and more particularly their professional, education. If, however, eight o'clock be considered too great a leap to make at once, nine may be fixed upon by way of commencement, but, whether eight or nine be the hour, it will be a mere farce if it amounts to no more than merely putting up the shutters and leaving the door half open—the present too-general custom. Let families and individuals make it a point of conscience, in every possible case, to abstain from evening shopping. Let them, also, do their utmost to discountenance the keeping the druggists' shops unshuttered on Sundays, which is now done under the cloak of an alleged but *unreal* necessity."

ELECTRO-TELEGRAPHIC PROGRESS.—A United States vessel, the *Arctic*, lately reached Cork after fathoming the bottom of the Atlantic ocean all the way across from Newfoundland, along "the telegraphic plateau," as it has been called. The result is reported to be perfectly satisfactory. Soundings were taken to a depth of 27,000 fathoms, but for some fifty or sixty miles from St. John's, Newfoundland, and again on this side, there is a bank varying from 25 to 120 fathoms, and between these a plateau, nearly level, with soft bottom composed of microscopic shells. The soundings were taken by the aid of steam power. The captain of the *Arctic* undertakes to lay down the projected cable at the rate of ten miles an hour right across. The American company who are to provide the cable have already about 1,700 miles at work, connecting Newfoundland with the United States lines, and it is expected that in a short time the 1,640 miles of the Atlantic cable will be a realized fact.

SANITARY RETROGRESSION.—The Dudley Board of Health have dismissed their officer of health, Mr. Houghton; reduced the salary of their inspector of nuisances from 120*l.* to 60*l.*; and that of their surveyor, Mr. Bateman, from 150*l.* to 100*l.*

MASONS' STRIKE AT NEWCASTLE-UPON-TYNE.—This unfortunate dispute between masters and workmen has now continued for some time, and seems as far off adjustment as ever. The men lately employed in St. Nicholas'-square have issued an address, in which they charge Mr. Robson, the contractor, with having violated terms he had previously consented to abide by. The terms are said to have been 4s. 4d. for five days in the week, and 2s. 4d. for the Saturday, on which day they were to have a half-holiday. The progress of the work meantime has not been wholly stopped.

PRESERVATION OF WOOD.—A method of charging the sap-tubes of timber with preserving fluids has been adopted at Paris by Dr. Boucherie, and the prepared timber applied as telegraph-posts, railway-sleepers, &c. A cross cut is made on the prostrate timber to nearly 9-10ths of its diameter: a wedge is then inserted, and a cord is wound round on the cut surface, leaving a shallow chamber in the centre, which is then closed by withdrawing the wedge. A tube is then inserted through an augur-hole into this chamber, and to this tube is attached an elastic connecting-tube from a reservoir placed some 20 or 30 feet above the level in which the wood lies, and a stream of the saturating fluid with this pressure passes into the chamber, presses on the sap in the sap tubes, expels it at each end of the tree, and itself supplies its place. The fluid used is a solution of sulphate of copper in water, in the proportion of 10 per cent. and a chemical test that ascertains the presence of the copper solution is applied at each end of the tree from which the sap exudes, by which the operator ascertains when the process is perfected. Several French commissions have investigated both the process and its effects, and have, it is said, reported favourably of its results, showing that the soft Scotch fir, green from the wood, may in a few days be cheaply rendered capable of resisting damp and weather more effectually than heart of oak in its unprepared state.

SMOKED BRICKS.—It is a singular fact, that smoke stains will show through almost any thickness of plaster. I once had a stack of chimneys blown down by a hurricane, in rebuilding which a portion of the old material was used, and a few bricks, japanned with the smoke of half a century, accidentally reversed. This was rough cast and whitewashed, in country-cottage fashion (I speak particularly of Ireland), but greatly to my annoyance, and somewhat to my surprise, the discolouration worked its way through all, as also through several successive layers of rough cast, and coats of whitewash. Lime-mortar had no other effect than that of increasing the size of the chimney-stack, which in a little time had outgrown all resemblance to its fellow stack, and its former self. Having endured this smoke nuisance for a season, and employed a stonemason, who, being a sort of handy man of the neighbourhood, had engrafted on his own solid stock, the kindred crafts of bricklayer and plasterer, to pull down and rebuild, instead of this he merely cleared away the rough cast, and rubbed the discoloured bricks over two or three times, allowing them to dry each time with some fresh cow-shed dung, diluted to the consistence of strong whitewash, which had the desired effect. When dry, it is perfectly free from smell, but whether it is retentive enough to hold paper I cannot say.—A READER.

IMPROVEMENTS AT EDINBURGH.—The population of the Scottish metropolis in 1841 was 166,450: it is now 210,000. This increase of population has given an impulse to the building trade, so long stagnate after the over speculation of 1825. Within the last five years there have been built Clarendon-crescent, Eaton-terrace, and Cambridge-terrace, at the Dean-bridge, and in the same vicinity Randolph-crescent, Randolph-place, and Great Stuart-street have been completed. The large district to the south, comprising the Grange, Whitehouse Estate, Greenhill, Morningside, and Merchiston, extending over a space of one square mile, has been intersected by numerous streets, and almost covered with houses, which, in five years more, will have become a southern city of villas. Numbers of houses in the same style have been built, and are building, on the north side of the city at Trinity and Granton. At present there are thirteen churches building, or about to be built—namely, the Baptist Church, in Dublin-street; English Episcopal Chapel, St. Vincent-street; St. Andrew's Episcopal Chapel, south back of Canongate; Free Tollbooth Church, St. Andrew's-square; Free Bucclench Church, Cross-causeway; Free St. Mary's, Broughton-street; Independent Chapel, George IV.'s bridge; United Presbyterian Church, South Clerk-street; St. Peter's Episcopal Chapel, South Clerk-street; New Free Church Assembly Hall, Lawnmarket; Grayfriars Church, rebuilding; new chapel in the Castle; and Trinity College Church, Calton-hill. Many mansions and villas are now building in the Royal-terrace, Calton-hill; at Bruntsfield-terrace, Greenhill; and in Greenhill-gardens. A new street, to be called Leuchars-street, is in progress behind Clarendon-crescent. The building trades are also busy with many other improvements in buildings, streets, and roads, and various statues are about to be added to those which already adorn the city.

DISCOVERY OF ANCIENT REMAINS AT ROYSTON.—An excavation of remote origin has been recently discovered on Royston Heath, on the summit of a lofty hill near to the old British and Roman Ickneld way and to a number of British tumuli. The spot in question, before it was opened, presented the form of a hollow oval, surrounded by a very low bank, and flanked on the north-east by a truncated mound, which had the appearance of having been disturbed. A small hillock within the circular bank, but most probably accidental, gave to the place a somewhat Druidical character. The hollow oval lies in a direction north-west and south-east. Its length is about 31 feet by a breadth of about 22 feet. Within the bank are two circular excavations, meeting together in the middle, and nearly forming the figure 8. Both excavations descend by concentric and contracting rings to the walls which form the sides of the chambers; the depth from the surface of the southern excavation being nearly 7 feet, from that of the northern, about 5 feet. The southern chamber has an upright wall to the height of nearly 4 feet: the wall of the northern chamber gradually recedes almost from the floor. A division wall about 2 feet 6 inches high in the southern chamber, and about 1 foot in the northern chamber, with an opening about 3 feet wide between the shoulders, separates the two chambers. The southern may be compared to an ampulla, with the foot turned inwards; the northern to an egg, or an ace of spades. The northern chamber is about 7 feet from north to south, by about 6 feet from east to west at the broadest part. A bench runs round it on the west side, about 1 foot high above the floor, by about 1 foot broad, and a similar bench occupies a small portion of the east side also. Various ancient and mediæval relics were found; but these do not seem to shed any light on the original purpose of the excavation.

[ADVERTISEMENT.]

TO THE EDITOR OF THE "BUILDER."

MESSRS. CLARK and Co. of 15, Gate-street, Lincoln's-inn-fields, having erected at our premises two very large revolving shutters, one weighing upwards of two tons, we feel much pleasure in recommending them, having acted exceedingly well during the whole of the three years they have been in use; also for the lowness of their charges and rigid punctuality, entitling them to the support of all those with whom durability is economy and time saved money made.

Our shutters may be seen nightly in active operation at eight o'clock.

SOWERBY, TATTON, and COMPANY,
Linendrapers, Regent-circus, Oxford-street.

TENDERS

For Haley-hill Church. Mr. Scott, architect:—

	Contract.	If roofs are oak, add.	If seats are of wainscot, add.
Brammalt	£24,525	£1,511	£398
Cordingly	18,782	803	398
Beanland	17,936	810	750
Cooper (accepted)	17,855	440	315

These amounts do not include carving, decoration, or stained glass, nor do they include the cost of foundations and plinth, which have already been executed. Presumed total cost besides:—

Carving	£2,000
Foundations and Plinth	1,480
Stained Glass and Decoration	700
Heating	300
Lighting	360
Laying out Ground, and Railing for same	320

For flagging, paving, and other improvements, to be done in the town of Ware. Quantities supplied:—

Coker and Oakes, Ware	£1,135 0 0
West, London	1,108 0 0
Eakins, Ware	1,095 0 0

TO CORRESPONDENTS.

"Mr. L."—"T. B."—"Anglo-Francais."—"R. D."—"A Subscriber," Dublin (complain to the newsvendor)—"W. P. G."—"D. M."—"Lex."—"G. H."—"J. and B. D."—"Dr. B."—"J. H. T."—"J. A."—"Subscriber."—"A. T. R." (thanks)—"E. A. F."—"J. N."—"Ra'eatcher."—"E. W. C."—"T. W. B." (useful advice can be given only by those who have seen the premises. Try a good *baking*. If ground lies against the walls, other steps would be necessary. Condensation of the damp air inside may have something to do with it).

"*Books and Addresses.*"—We are forced to decline pointing out books or finding addresses.

ADVERTISEMENTS.

The Excellent Stock of a Timber Dealer and Builder.

MR. LEREW will SELL by AUCTION, on the PREMISES, No. 42, Union-street, Somers-town, on MONDAY, SEPTEMBER 15, at TWELVE for ONE o'clock precise time, on account of the number of lots, the well-seasoned STOCK, comprising 2,000 yellow, white, pine, and spruce planks, deals, and battens; 120 squares of prepared yellow and white flooring, 3000 feet seasoned sixfy doors, twenty-eight pairs of sashes, dry cut stuff, pulpit, fourteen benches, ironmongery, four ranges, seventeen register and elliptic stoves, scaffold-poles, boards and cords, iudeed work-benches, tools, and utensils in trade.—May be viewed and catalogues had on the Premises, and at the Auction Offices, Cardington-street, Hampt ad road, near the Euston Station.

A YOUTH WANTED, in a SURVEYOR'S OFFICE, where a premium will be required, to reside with the family or otherwise.—Apply to Mr. CHARLES RAWSON, Engineering Surveyor, and Surveyor to the Rotherham and Kimberworth Local Board of Health, Rotherham, Yorkshire.

WANTED, in a Builder's Office, a young or mid lle-aged person as CLERK He must be acquainted with the usual routine of such a situation.—Apply to J. W. and SON, Earl-street, Westminster.

WANTED, in the Manufactory of a General Contractor for Ironwork, a PERSON who has been accustomed to make estimates and furnished and working drawings.—Apply by letter, stating age, where last employed, and salary expected. Without these particulars no letter will be attended to.—Address, X. Y. Mr. Chalfont, 30, Great Tichfield-street, Oxford market.

WANTED, a PUPIL in an Architect's Office.—Apply by letter to D. I. at Plummer's Library, 46, Theobald's road, London

TO CLERKS OF WORKS.

WANTED, by the Uxbridge Local Board of Health, a CLERK of WORKS, to superintend the house connections &c.—Apply to Mr. EVES, Surveyor, Uxbridge

WANTED, in a Retail Deal and Timber Yard, an active young Man as WORKING DEAL FOREMAN He will be required to mark deals for cutting, to arrange the stock for selling, and to serve retail customers. A liberal salary will be given to one capable of these duties. Good references as to honesty and ability indispensable —Communicate by letter to SPRUCE, Post-office, 24, Cornhill.

TO PARENTS AND OTHERS.

WANTED, a respectable Youth, as IN-DOOR APPRENTICE to a PLUMBER and DECORATOR, where he will be treated well, and have the best opportunity of becoming perfect in his business. For address, and further particulars apply to Mr. SEABROOKE at his offices, Camden terrace, Peckham road, Peckham (A premium expected)

TO ARCHITECTURAL DRAUGHTSMEN.

WANTED, in the Office of an Architect and Civil Engineer, in the country, an experienced CLERK, a good designer, capable of making finished and detail drawings, well acquainted with perspective, and conversant in preparing specifications and estimates. An efficient Assistant would meet with a permanent situation and a remunerative salary.—Applications, with terms and references, to be addressed to THOMAS M. PENSON, the Bars, Chester.

WANTED, for an Indian Railway, a Person well acquainted with rock tunnelling. Also, two persons experienced in railway brickwork. Good character indispensable.—Apply by letter only, stating age, qualifications and experience, to Mr. W. G. THORPE, 1, Riches-court, City, London.

WANTED, a THREE-BRANCH HAND. Apply personally to GEORGE TODD, Jun. Builder, Glebe-place, King's-road, Chelsea.

WANTED, by a first-rate DRAUGHTSMAN, WRITER, and COLOURIST, an ENGAGEMENT, to execute Maps and Plans of Estates, Towns, Parishes, Railways, Docks, Mines, Cemeteries, Drainages, Board of Works and Local Board of Health Plans, &c. Has for eighteen years executed plans of portions of every variety, for the profession and the Government.—Apply, by letter, to R. THEODORE, 4, Trafalgar-square.

TO DECORATORS, &c.

WANTED, a SITUATION, by an OIL GRAINER, ORNAMENTAL PAINTER, &c. Good references as to character and ability can be given. Wages not so material as a constancy. No objection to either town or country. Address, B. C. Office of "The Builder."

TO WHITESMITHS, BELLHANGERS, GASFITTERS, &c.

WANTED, by an experienced, steady Man, aged 27, a CONSTANT SITUATION in any of the above branches.—Address, R. J. W. 16, Albert-crescent, Lee, near Blackheath, Kent

WANTED, by a Clerk, whose articleship has expired, a SITUATION in an Architect's or Builder's Office. Salary not so much an object as the opportunity of being able to obtain a thorough knowledge of the business in all its branches. Unexceptionable references can be given.—Address to J. B. WATTS, St. Mary's Lodge, Woodford Wells, Essex.

TO GOTHIC CARVERS AND JOINERS

WANTED, an experienced Person to undertake the MANUFACTURE of CHURCH FURNITURE, by a house engaged in that business.—Address, J. S. 13, Southampton-street, Strand.

TO SAW-MILL PROPRIETORS.

WANTED, by a Young Man, a SITUATION as FOREMAN in a SAW-MILL. Can also work a saw-bench, has no objection to the country, and can have good references.—Address, T. B. 23, Cordelia-street, Crisp-street, Poplar New-town.

AN Assistant, who has just completed an engagement with an Architect in the City, desires a RE-ENGAGEMENT in the country. Good references. Address, DORIC, Office of "The Builder."

TO CARPENTERS, BUILDERS, AND OTHERS.

WANTED, by a Young Man, aged 28, a SITUATION, as SHOP FOREMAN of JOINERS, or to assist in a Builder's Office. Understands setting out work, making out plans, and surveying, &c No objection to the country.—Address, L. M. Office of "The Builder."

TO BUILDERS.

WANTED, by a thoroughly good PLUMBER, GLAZIER, PAINTER, PAPERHANGER, GRAINER, &c. a constant SITUATION, or a six months' job. A first-rate reference given. Aged 32 Address to GEORGE GREEN, Post-office, Grays, Essex.

WANTED, by a Young Man, a SITUATION, as PLUMBER, GLAZIER, and GASFITTER. No objection to town or country.—Direct, H. M. 23, Thomas-street, Ibson-street, Lambeth.

TO BUILDERS, HIGH STEWARDS, STATESMEN, HEADS OF LARGE FIRMS, AND OTHERS.

WANTED, a PERMANENCY as FOREMAN in the PAINTING and GLAZING line, by a married man without family. No objection to any part of England Ireland, Scotland, Wales, France, or to go farther abroad. Good references if required.—Address, stating wages, to M. J. M care of Messrs. Davies and Son, Stationers, 5, Northgate-street, Gloucester.

TO PAINTERS, DECORATORS, &c.

Open daily from Nine till Six, thus avoiding inconvenience or publicity.—Form of application and prospectus, gratis, on receipt of stamped envelope.

THE PORTLAND CEMENT WORKS, NORTHFLEET, KENT.—Messrs. ROBINS and CO. to WHOM THE PRIZE MEDAL WAS AWARDED in 1851, are prepared to supply any quantity of the very best PORTLAND CEMENT, manufactured by them for all the purposes to which Cement is applicable. Orders received at Great Scotland-yard and at the Works.

PORTLAND CEMENT WORKS, NORTHFLEET, Kent.—KNIGHT, BEVAN, and STURGE, Manufacturers only of first-class quality, for the home and foreign trade. Portland Cement is manufactured at these works with especial reference to its destination, whether for stuccoing, brickwork, blocks for breakwaters, fluvial work, or otherwise. London Wharf, Belvedere-road, Lambeth.

PORTLAND and ROMAN CEMENTS.—T. H. ROBERMAN, WILD, and CO. MEDWAY LIME and CEMENT WORKS, LOWER HALLING, near Rochester. Agent at the Works—Mr. THOMAS WEEKES.
Agents in London, Messrs. GEORGE POTTER and CO., Limemerchants, Purfleet-wharf, Earl-street, Blackfriars, and No. 19, North wharf-road, Paddington.

PORTLAND and BATH CEMENTS.
TATHAM and CO.
14, South Wharf, Paddington.

PORTLAND and BATH CEMENT.—FULLWOOD THOMPSON and CO. request the attention of Merchants and Contractors to the quality of their Portland and Bath Cement which they manufacture on an improved system, securing regularity of strength and colour, and at a less cost than is attainable by most other makers.
These cements set under water in a few minutes, and are not affected by extreme heat or cold.
FULLWOOD THOMPSON & CO. will be happy to send prices and samples in reply to application by post. They deliver free into the Bristol and Exeter Railway Company's trucks at their works, or free on board in the Port of Bridgewater.

GEO. & THOS. EARLE, CEMENT MANUFACTURERS, HULL.—Light, Dark, and Portland Cements equal to any made. Manufacturers also, and Dealers in Plaster, Paris White, Whiting, Hair, Lias Lime, Lathe, Slates, and Slate Slabs, Fire-brick, Grindstones, Cement Chimney-tops, ditto Vases, Ridging, &c. Paints, Stucco, &c. Marble Merchants and Importers of Pozzolano.
11, George-yard, Lombard-street, City.

ELMLEY CEMENT WORKS.—ROMAN and PORTLAND CEMENT of the first quality manufactured on the above works. Also STOCK and KILN-BURNT BRICKS, hard, moulded and machine made, for shipment or otherwise.—Apply to G. H. OTTER, Agent, as above.

KEENE'S and PARIAN CEMENTS and FRENCH PLASTER, for internal uses. These well-known hard Stucco (dry quick), and can be painted upon within a few days. Made and sold by JOHN BAZLEY WHITE and BROTHERS, Millbank-street, Westminster.

ATKINSON'S CEMENT, so long known and esteemed in all parts for plastering purposes, is a quick-setting Cement, that requires no colouring.—Sold exclusively by JOHN BAZLEY WHITE and BROTHERS, Millbank-street, Westminster; and Seel street, Liverpool.

ARTIFICIAL HYDRAULIC or PORTLAND CEMENT combines the valuable qualities of the natural Cement with the additional advantage that it greatly excels them in its cementitious properties; that it is not affected by frost, and does not deteriorate during prolonged keeping. Analysis of COMPARATIVE EXPERIMENTS on the strength of this and other Cements made at the Institute of Civil Engineers, is the Chief from the Lime Works. JOHN BAZLEY WHITE, and BROTHERS, Millbank-street, Westminster, who prepare one quality only of Portland Cement.

BATH, PORTLAND, and ROMAN CEMENTS.—The London and West of England Cement Company, erected for the sale of the best natural HYDRAULIC CEMENTS at reduced prices, have the improving particulars to recommend the best quality of their Roman Cement for all such purposes, decorations &c. as natural hydraulic cements from site for an interior cement and being quite unaffected by extremes of weather. The Company also supply BLUE LIAS LIME, lump and ground, which will carry more sand than any in the market.—Communications to be addressed to the General Offices, 80, Old Broad-street, London, to Mr. M'NUMENT, 4, Carolina-place, City-road; to Mr. TIMEWELL, the Depôt, 9, North Wharf-road, Paddington; or to the Works, Dunball Bridgewater.

SOUTHAM BLUE LIAS LIME DEPOT.
Glazed Stoneware Sewerage Pipes.
Brick, Lime, and Cement Merchants,
TATTAM and CO.
14 South Wharf, Paddington.

PARIAN CEMENT, reduced in price 25 per cent. This article is valuable for inside stucco, and especially for skirtings, for flooring on brick arches, &c. It takes paint in a few hours after its application on walls or laths, is water and efflorescence, and may be painted in a couple of days. A finer quality forms a beautiful Scagliola, with any admixture of colours. Manufactured by FRANCIS, BROTHERS, Cement Works, Nine-elms, London.

CEMENT.—ROMAN and PORTLAND CEMENTS, and PLASTER of PARIS, manufactured by C. J. HILTON and SON, Fareham, Hants, and sold by them at his wharf, 6 Upper Thames-street, London; and also at the manufactory, Fareham, Kent.—N.B. These Cements supplied for shipment on advantageous terms.

JOHNS and CO.'s PATENT PERMANENT STUCCO WASH (perfectly non-absorbent), STUCCO, CEMENT, STUCCO PAINT.—CLARK and HENDOUGH, Manufacturers, Grand Surrey Canal Bridge, Old Kent-road. Office, 4, George-yard, Lombard-street.

PORTLAND CEMENT.—JAMES WESTON having enlarged that portion of his CEMENT WORKS on Millwall, Poplar, for Manufacturing the above CEMENT, begs to inform the Trade in general that they can be supplied with any quantity they may require, either at his Works, St. Andrew's Wharf, Earl-street, Blackfriars, or Middle Wharf, Scotland yard, Westminster. Manufacturer of Roman, Lias, and Mastic Cements, English and French Plaster, &c.

PORTLAND and ROMAN CEMENT.
PLASTER of PARIS
Manufactured by J. M. BLASHFIELD, at Millwall Isle of Dogs.
Warehouse, No. 1, Wharf Paddington-basin.

BLUE LIAS LIME.—CHAS. NELSON begs to offer to consumers a supply of Blue Lias lime direct from his Quarries at Warckshire, which has been tested by several of the largest building firms in the metropolis and approved by them; and those who have favoured C. N. with their patronage do find for the last three years have always expressed themselves satisfied with his system of weighing or measuring the lime. When the lime is delivered by boat, the master has instructions to produce his demand the canal ranger's pass, by which the purchaser may know the exact weight delivered. Orders addressed to the London Depôt, 16, South Wharf, Paddington. J. B. BLYTH, Sole Agent, will have immediate attention.—Quarries and Manufactories, Stockton, near Southam, Warwickshire.

HUBBUCK'S WHITE BODY PAINT of superior body to the Best White Lead, whilst it is as smooth and permanent as Zinc Paint. One coat laid on as directed is equal to two coats of White Lead; whilst the consumption of material is less than for one coat. It dries very fast and hard.
HUBBUCK'S STONE COLOUR BODY PAINT the same as the former, at three-fourths the price.
HUBBUCK'S PATENT WHITE ZINC PAINT is invaluable for Iron Ships and iron exposed to salt water; neither bilge water, nor noxious vapours from cargo, nor heat on the funnels of Steam Vessels act upon it. Sold by the Wholesale Paint Dealers, in original packages, stamped, HUBBUCK, LONDON, PATENT; and when so marked the quality is guaranteed.
HUBBUCK'S COPPER COLOUR ENAMEL PAINT prepared expressly for the bottoms of Iron and Wood Steam Ships, a protection from rust and incrustation. Timber coated with this Enamel is not attacked by the worm neither do barnacles attach to it.
Full particulars of THOMAS HUBBUCK and SON, Paint and Varnish Works, opposite the London Docks, London.
OLD ZINC AND ZINC CUTTINGS BOUGHT TO ANY EXTENT.

CHARLES RICHARDSON, 3 & 8, SOUTH-WHARF, PADDINGTON BASIN.
COWLEY AND KENT BRICKS.
PORTLAND, ROMAN, AND OTHER CEMENTS.
TAMWORTH GLAZED SEWAGE PIPES.

BRICKS of all kinds (clamp-burnt or kiln-burnt), Lime, Chalk, Chalk Rubbish for brick-making, Flints for building and pottery work, Foundry Loam, Whitne Whiting Sand for sulphate, Lump Drain Pipes, Patent Drain Pipes (as used for the Crystal Palace), &c. &c. are supplied from Messrs. MEEson and CO.'S works at Grays, Essex, to any part of the Thames, the various canals, the river Lea, &c. or by rail to any station on the Eastern Counties Southend and Eastern Counties lines, or any railway connected with them. Vessels of 200 to 300 tons can load at once at the wharves at Grays. At MEESON and CO.'S wharf and Halls, Bow-bridge, Stratford, Essex, the above named articles can always be procured, as well as all kinds of merchants' Welsh and Newcastle Firestone, Plate Burnt Lime, and Marble and Terrace Lime; and here lime is racked in hogsheads, casks and bags, for exportation.
General Offices, No. 12, GEORGE YARD, LOMBARD-STREET.
Letters addressed to Grays, Essex, will meet with immediate attention.

BRICKS.—Malm Cutters, Yellow and Pale Seconds, Pavers, and Pickers of good and sound quality, consisting of about 30,000 MR. DODD'S Brickfields, which are just a quarter of an hour's walk from the City. H. D. earnestly requests purchasers to favour him with a visit, in order to inspect his stock and judge for themselves.
Malm Place Inf. washed Stock, and Place Bricks, also on sale. These bricks are sound, well burnt, and unusually free from defects; a very large proportion of the stock being suitable for external facing.
Apply to HENRY DODD and CO., at the Counting-house, Hoxton Brickfields, Bruce-road, near the Rosemary Branch, Hoxton.
N.B. Light coloured Pitt sand of a good quality constantly on sale upon reasonable terms. This Sand, from its not containing any saline matter, is acknowledged to be preferable to river sand.

THE BEST HERTFORDSHIRE MALM STOCKS;
THE BEST WHITE SUFFOLK and RED FACINGS;
WHITE SUFFOLK PERFORATED BRICKS;
DEEP RED RUBBING BRICKS.
Also COWLEY and KENT STOCKS, in any quantities.
J. EASTWOOD and SONS, Belvidere-road, Lambeth; and Surrey-canal-bridge, Old Kent-road, Surrey.

BRICK-FIELDS, QUEEN'S-ROAD, PECKHAM, SURREY
(Within a short distance of the five bridges).
THE BEST MALM, PALE, and RED FACINGS, PICKINGS, and PAVIORS, in any quantity.
Also, STOCKS, of FIRST QUALITY.
J. EASTWOOD and SONS, Belvidere-road, Lambeth.

TO BRICKMAKERS and OTHERS.—BRICKFIELDS TO LET.—NORTHYDE, HESTON, MIDDLESEX.—The Trustees of the Lands and Charities belonging to the poor of the Parish of Heston, in the County of Middlesex, will meet in the Vestry-room of the Parish Church of Heston, on TUESDAY, the 23rd day of SEPTEMBER instant, at FIVE o'clock in the afternoon precisely, when they will be ready to receive TENDERS from such persons as may be willing to RENT a certain FIELD of BRICK-EARTH, belonging to the Trustees, called Western-end Field, situate at Northyde, in the Parish of Heston, for the purpose of making bricks. This field contains seven acres, of superior quality, and of good depth; it is approached by excellent roads, and has the advantage of being near to the Grand Junction Canal. Particulars and conditions, with form of Tender attached, may be obtained after the 17th instant, on application to Messrs. CLARK and RUSTON, Solicitors to the Trustees, Brentford.—Bidders are requested not to attend personally, but to address their Tenders, sealed, to Mr. CHARLES ELEY, Jun. Hounslow, Middlesex.—The Trustees do not pledge themselves to accept the highest or any Tender, and will not accept any unless made on the proper printed form, and delivered to them in the Vestry-room of the Parish Church of Heston, on TUESDAY, the 23rd instant, by FIVE o'clock of the afternoon precisely.—Heston, September 11, 1856.

BRICKS.—Mr. Rydon having made more bricks than he requires for the builders on his estate, Highbury New-park, would be willing to enter into arrangements with builders and others for supplying first-class STOCK and RED BRICKS upon advantageous terms.—For particulars, apply at the Estate Office, Bell's Farm, Stoke Newington Green.

BRICKS.—TO BE SOLD, in one Lot (to be removed immediately), about 700,000 BRICKS, principally Place, lying about two miles from a railway station on the North Kent line, and about the same distance from water carriage; good roads.—Apply to Messrs. BROWN and ROBERTS, 23, Throgmorton-street.

ROUPELL-PARK BRICKFIELDS, LOWER NORWOOD, SURREY, near the Crystal Palace. Entrance, Norwood end, Palace-road.—BRICKS of the first class. Red Kiln Bricks, Cutters, Dressings, Facings, and Paviors, Clamped ditto, Yellow and Pale, Seconds, Paviors and Pickings, Washed Stocks, Sho ks, and Place. Apply to THOMAS and CO. Norwood Lodge, Palace-road, Roupell-park, Lower Norwood, Surrey.

IMPROVED AIR-BRICKS.

WILLIAM GILBERT, Manufacturer of all kinds and colours of Tiles, Quarries, Drain pipes, Moulded Bricks, Brackets, Vases Chimney-pots, Stoneware Glazed Sewerage Pipes, Ornamental Quoin Blocks, &c. Tividale, Staffordshire.

THE PATENT BRICK MACHINE COMPANY invite orders for their IMPROVED MACHINES. One of them is working in a field at Caterham, near Croydon, and arrangements are made with the owner for bearers of a letter from the Secretary, to see it in operation every Thursday and Friday. It is the most simple machine invented. Trains from London-bridge to Warlingham (close to the field), leave at 6 and 9.30 a.m. and 3 p.m.; return at 9.55 a.m. and 5.5 and 7.55 p.m.
HENRY C. SQUINT, Sec.
37, King William-street, City.

TO BE LET, a BRICK and TILE YARD, in the neighbourhood of Plymouth, now in full work, for the remainder of a term of fourteen years (four years having expired). The yard is most convenient, being situated on the river Tamar, which brings it in immediate communication with several important places in Devon and Cornwall, in addition to the Port of Plymouth. It is also in the centre of a large mining and agricultural district. There is an excellent kiln, sheds, &c. and the slacking ground is on the margin of the river, which offers great facilities for shipment. A considerable trade in bricks has been done for the last four years, and still continues for Government works, which of itself is sufficient proof of quality. For terms and particulars, apply to WHITE and PARSE, Millbay, Plymouth.

BEADON'S EAVES GUTTER TILES.—Mr. LAWES is prepared to CONTRACT for the ERECTION of the above TILES on roofs of all descriptions, in the neighbourhood of London, at 2d. per foot; above 100 feet, 6d.—Office, 1, Adelaide place, London-bridge.

BEADON'S PATENT IMPERISHABLE GUTTER TILES,
For Spouting Roofs of Houses either old or new, whether of thatch, slate, or tile, and other structures.
SOLE AGENT,
J. B. LAWES, 1, Adelaide-place, London-bridge.
This is the cheapest kind of spouting known, for, besides its being not without paint or repairs as long as the building itself. It will bear the weight of any ladder; and in case of accident a labourer can repair it. It occupies the room of a large amount of roofing, effecting a great saving in slates, tiles, &c. It is especially applicable to the backs of houses in town, cottages, and agricultural buildings.
Price of length tile of about 13 inches long; stop-ends and outlets, 6d. Any mason can put them up, or, if over 100 feet are required, a man will be sent to fix them at 5d. per foot. This charge to include tiles (delivered in Agent's yard), cement, and labour. May be had in London, Gloster, Bridgwater, and Rugby.

MINTON and CO.'S ENCAUSTIC and other PATENT TILES, for Churches, Entrance Halls, Conservatories, Balconies, &c.; Antique, Geometrical, and Alhambro Mosaics, manufactures of a highly decorative character, and extreme durability; Slabs and Tiles for Fireplaces and Hearths, Cornice for Grates, Door Furniture, White Glazed and Ornamental Tiles for Halls, Dairies, and Kitchen Rooms, may be had, in great variety at their Warehouse, 9, Albion-place, Blackfriars-bridge, London; and at their Manufactory, Stoke-upon-Trent, Staffordshire.

PEAKE'S TERRO-METALLIC TILES, PIPES, &c.—Notice is hereby most respectfully given, that the LONDON DEPÔT for this WARE is REMOVED to No. 21, WHARF, Wakefield-street North, City-road Basin. Secondly, that the trade term, "TERRO-METALLIC," is the exclusive right of the Proprietor, and, thirdly, that the "REPORTS OF THE JURIES," page 581, of the Great Exhibition, rank the Manufactories KNOWN so long as "The Tileries." Tunstall, Staffordshire, as the first of the kind in the world.

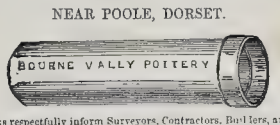
PANTILES, PAVINGS, &c.—J. H. ANDREWS, Wisbeach, Cambridgeshire, begs to offer pantiles at 52s. 6d. per 1,000; floor bricks and 6-inch pavings, at 37s. 6d. per 1,000; 8-inch pavings, at 57s. 6d. per 1,000; plain tiles, at 25s. per 1,000, delivered, on cash prices.—Delivered on trucks in London on Eastern Counties Railway.

ROYAL POLYTECHNIC.—Entire Series of Novelties.—Lecture, with Experiments and Dissolving Diagrams, of Bessemer's new Process of Manufacturing Iron and Steel, by J. H. Pepper, esq., every day at Three, and every evening, except Monday and Saturday, at Eight. New Entertainment by Leicester Buckingham, esq. entitled, "Life in the West; or, every-day Life in the Log Hut and the City;" illustrated by a series of highly-finished Dissolving Views, painted by G. Harvey, esq. from sketches taken on the spot.

GREAT REDUCTION in PRICE of STONEWARE DRAIN-PIPES.

WILLIAM NORTHEN,

UNION POTTERY, 14, VAUXHALL-WALK, LAMBETH,



Begs to call the attention of Surveyors, Contractors, Builders, and others, to a very great REDUCTION in the PRICES of his

GLAZED STONEWARE DRAIN-PIPES.

LISTS OF PRICES FORWARDED ON APPLICATION.

THE LATE FIRE AT THE BOURNE VALLEY POTTERY,

NEAR POOLE, DORSET.

The Proprietors of the above Works respectfully inform Surveyors, Contractors, Builders, and Others that the buildings rendered necessary by the late disastrous fire are now nearly complete, and they are enabled to supply SALT GLAZED STONEWARE DRAIN-PIPES, BENDS, JUNCTIONS, CLOSET-PANS, TRAPS, &c. in any quantities. These Pipes, &c. being made under immense pressure by new and patented machinery, and burnt, by intense heat, to as near equal degree of hardness, are very far superior to any hitherto made in Hants or Dorset, and will bear comparison with any in the kingdom; and being made of clay of the finest quality, the produce of the estate can be rendered at very moderate prices.

The goods, or any information respecting them, may be obtained on application to the Manager, Mr. J. T. BOUNSALL, Bournemouth, near Poole; or the Agent, in London, Mr. G. S. WHITTON, 17 and 18, Princes-street, Lambeth.

N.B. A liberal discount to the Trade. A large Stock always on hand.

AYLESFORD POTTERY COMPANY,

BELVEDERE-ROAD, LAMBETH.

MANUFACTORY AT AYLESFORD, NEAR MAIDSTONE, KENT.

The above Company having now been in existence for nearly six years, and having during this period supplied DRAIN PIPES, &c. to some of the largest Works in and around London, viz.:—The New Cattle Market, Wellington and Chatham Barracks, Deptford Dockyard, Her Majesty's Commissioners of Works, &c. and in all instances parties using them expressing themselves satisfied therewith,—take this as a fair test of the quality of the articles supplied by them; and as they now feel themselves established as Potters, beg to offer their goods to Contractors, the Trade, &c. of a first-rate quality and manufacture, and at the lowest possible prices, NOT BEING IN ANY WAY CONNECTED WITH THE LONDON POTTERS' ASSOCIATION.

THE BRANKSEA POTTERY,

NEAR POOLE, DORSET.

GREAT REDUCTION IN PRICES OF DRAIN-PIPES.

TO THE METROPOLITAN BOARD OF WORKS, DISTRICT BOARDS, BOARDS OF HEALTH, TOWN COUNCILS, IMPROVEMENT BOARDS, SURVEYORS, AND BUILDERS.

THE BRANKSEA POTTERY and CLAY COMPANY are prepared to supply all descriptions of Glazed Drain-pipes, Bends, Double and Single Junctions, Closet-pans, &c. Also, Terra-cotta Chimney-pots and Fire-bricks of a very superior quality at moderate prices.

N.B. A LIBERAL DISCOUNT TO THE TRADE. A LARGE ASSORTMENT OF GOODS CONSTANTLY ON SALE.

The clay obtained from the pits on the island of Branksea is of the finest quality, and the goods are manufactured by men of long experience in the trade, with the aid of powerful machinery. The articles offered for sale will be found to bear comparison with the best goods manufactured in any part of England.

A list of prices forwarded free on application to Mr. T. G. BECK, at NEW WHARF, No. 6, Little Abingdon-street, adjoining the New Houses of Parliament; or to Mr. R. PETTS, at the Works, Branksea Island, Poole, Dorset.

CHEAP AND DURABLE ROOFING.

By Her Majesty's  Royal Letters Patent.

F. McNEILL and CO. of LAMB'S-BUILDINGS, BUNHILL-ROW, LONDON,

Manufacturers and ONLY Patentees of

THE PATENT ASPHALTED FELT, FOR ROOFING HOUSES, VERANDAHS, SHEDS, &c.

Patronized by

HER MAJESTY'S WOODS AND FORESTS,
HER MAJESTY'S COMMISSION OF CUSTOMS,
HONOURABLE EAST-INDIA COMPANY,
HONOURABLE BOARD OF ORDNANCE,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANICAL GARDENS, REGENT'S PARK,

And by the most eminent members of the Royal Agricultural Societies of England, Scotland, and Ireland; at whose great national shows it has been exhibited, and OBTAINED THE PRIZE, for being the best and cheapest article for roofing; also used for under slates at the Royal Agricultural Society's House, in Hanover-square. Its advantages are lightness, warmth, durability, and economy. It is impervious to rain, snow, and frost, and a non-conductor of heat and sound. The Felt can be cut to any length, by 32 inches wide. The price is only ONE PENNY PER SQUARE FOOT. Samples, with full directions as to its uses and the manner of applying it, with TESTIMONIALS, some of them of seven years' experience, from Architects, Builders, Noblemen, and Gentlemen who have extensively used it, sent free to any part of the town or country. A Dry-hair Felt, for covering Boilers, &c. is also manufactured, by which a saving of about 25 per cent. in fuel is effected. The TRADE are respectfully enjoined to send their orders DIRECT to the FACTORY, as the surest means of being supplied with the genuine article, and in lengths best suited to their roofs. They are likewise CAUTIONED AGAINST MISREPRESENTATION of THE ONLY WORKS in Great Britain, where the above roofing is made are F. McNEILL and Co's Manufactories, LAMB'S-BUILDINGS, BUNHILL-ROW. It is covered with the Felt to be seen at the Factory, also the new Vice-Chancellor's Courts, the passages and offices leading to Westminster Hall, and other buildings at the New Houses of Parliament.—A Liberal Discount allowed to the Trade.

TO SPECULATIVE BUILDERS and OTHERS.—FOR SALE, about FIFTY-FOUR LOADS of sound ROOF TIMBER, in good condition, and of various lengths and sizes.—The timber may be viewed on application to Mr. WADE, of 38, Lower Shadwell, to whom offers for the whole or a portion may be made; and it will be taken down and loaded into the carts of the purchaser free of expence.

TO BUILDERS AND OTHERS.

AT the LOWEST PRICES.—TIMBER, DEALS, MAHOGANY, and WAINSCOT. A large assortment of seasoned prepared FLOORINGS and MATCH BOARDING of all descriptions. Also an extensive stock of Dry White Yellow, and Pine Cut Stuff, Slating, Battens, Pantile Laths, Oak Plank, Sash Cills, &c. Timber of all kinds, Planks, Deals, and Battens, fetched from the docks, sawn by patent machinery in the best manner, and delivered at the shortest notice.—THOMAS JACKSON, Sawing and Planing Mills, Commercial-road, Pimlico, London.

MAHOGANY and WAINSCOT seasoned by Symington's New Patent Process.—JOHN COUMBE solicits an inspection of his stock. The above process enabling him to season his wood in a comparatively short space of time, he sells at prices generally charged for wet wood.—Address, PATENT WOOD SEASONING WORKS, Lady Lake's-grove, Mile-end-gate.

FURTHER REDUCTION of PRICES.—SAMUEL PUTNEY has much pleasure in informing his numerous friends that he has made a further reduction in the price of Pine Planks, &c. and respectfully solicits an inspection of his large and well-selected stock of Deals &c.

Pine Planks, 12 feet by 3 in. by 11 in. from	£21	0 per 120.
Yellow Battens, from	11	10 "
Yellow Deals, from	20	0 "
Spruce Deals, from	16	0 "

Prepared Flooring, &c. equally low. A list of prices forwarded on receipt of a postage stamp.—N.B. All sawn goods delivered within two miles free of carts, &c.—Borough-road, Southwark, and Elm-street, Gray's-inn-lane.

FLOOR BOARDS, &c.—R. SLADE begs to inform Builders and the Trade, that he has now on hand a large assortment of FLOORING and MATCHED BOARDING, from ¼ inch to 1½ inches thick, seasoned, and ready for use; also, Mahogany, Moulding, Wainscot, and all kinds of Timber required for Building purposes.—Address, R. SLADE (late E. Simms), Flooring Manufactory, Wilton-road, Pimlico.

ALFRED ROSLING begs to inform his Customers and the Building Trade generally, that he is enabled to allow a discount of 15 per cent. upon his list prices for Mouldings.—A large stock of dry flooring at low prices.—Southwark-bridge Wharf, Bankside.

MACHINE CARVING WORKS (Patent). Ecclesiastical and every other description of CARVING. A magnificent Gothic Screen, Carved Glass Frame, and other specimens. Tables, Chairs, Lecterns, &c. Designs and estimates at the Works, Belvedere-road, Lambeth, foot of Hungerford-bridge.

ANOTHER GREAT REDUCTION.—Yellow Deals, 3s. 3d.; Pine Plank, 3s. 6d.; Spruce Deals, 3s.; Mahogany, 6d.; 2½ Yellow Battens, 12.10s.; F. Walnut, 7d. Carriage free in town.—T. FORMAN, 1, Walnut-tree-walk, Lambeth-walk.

EDWARD SIMMS begs to inform Builders and the trade, that he has now on hand at his manufactory (the first of its kind ever established), a large assortment of PREPARED FLOORS and MATCH BOARDING, seasoned and ready for use, from ¼-inch to ¼-inch thick, in White or Yellow Deal, Oak, or Pitch Pine. Also Dry Deals, in all thicknesses, Slating Battens, Pantile Laths, Oak Sills, Plank, and Scantlings. Mouldings in clean Pine, to any design. A pattern list forwarded on application.—Address, E. SIMMS, Flooring Manufactory, and Sawing, Planing, and Moulding Mills, King's-road, Chelsea.

NOTICE of REMOVAL.—EDWARD SIMMS begs to inform his customers and friends that he has REMOVED his business from Wilton-road, Pimlico, to the KING'S-ROAD, CHELSEA, where their orders will be promptly executed as heretofore.—Please address, E. SIMMS, King's-road, Saw-mills, Chelsea, opposite Manor-street.

MOULDINGS BY MACHINERY. Capping, Sash-bars, Beads, &c. to any Design, carefully packed and sent to all parts of the Country. A Pattern List sent on application to

E. SIMMS,
SAWING, PLANING, AND MOULDING MILLS,
KING'S ROAD, CHELSEA.

PATENT SOLID SWISS PARQUETERIE. This beautiful, unique, economical, and elegant description of Flooring, so extensively used in Paris and other continental cities, is now introduced into this country; an extensive assortment of specimens and patterns commencing at 1s. per foot super together with every particular of its cost and adaptation, can be obtained of Messrs. H. P. BURT and CO. 2, Charlotte-row, Mansion-House; or of Messrs. ARROWSMITH and CO. 80, New Bond-street.

ACORN TIMBER WHARF and SAW MILLS,
CANAL BRIDGE, OLD KENT-ROAD, LONDON.
A Monthly Price Current forwarded on application.
RICHARD MAY, Proprietor.

LETT'S WHARF PATENT SAWING, PLANING, and VENEER KNIFE-CUTTING MILLS, Commercial-road, Lambeth. The Proprietors beg to announce to the trade that they have completed their extensive arrangements, and will be happy to execute all orders entrusted to their care with despatch and punctuality. Wet and dry docks and powerful cranes for landing heavy goods, offer facilities not to be obtained elsewhere. A large assortment of seasoned prepared flooring match boarding, &c. &c. always in stock at reduced prices.

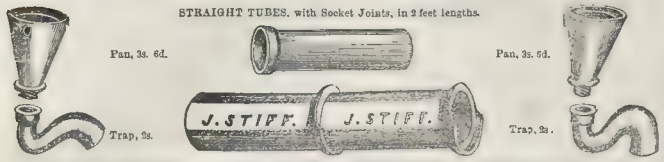
ROBINSON and BARTRAM, SAWING and PLANING MILLS, BELVIDERE-ROAD, LAMBETH, and SWAN-STREET, BERMONDSEY, having completed powerful MACHINERY for SAWING TIMBER, for building purposes, will be glad to receive ORDERS in this Department, and beg to assure their friends that all favours shall be executed in the best manner, and with the utmost punctuality and despatch.

ST. PANCRAS SAWING, PLANING, and MOULDING MILLS, Cambridge-street, Old St. Pancras-road.—GEORGE NOKES and CO. invite the attention of Builders and the Trade generally, to their STOCK of DRY FLOORING, at the following prices, for cash:—

¾-inch white, 15s. 6d. per square; ¾-inch white, 15s. per square; 1-inch white, 18s. per square; ¼-inch yellow, 15s. per square; ¾-inch yellow, 13s. 6d.; 1-inch yellow, 20s.

Timber, deals, planks, &c. at the lowest remunerative prices. A liberal discount allowed on mouldings for exportation. Book of designs forwarded on application.

DRAINAGE.—To BUILDERS, CONTRACTORS, LAND SURVEYORS, &c.—TO BE SOLD, a quantity of large-size DRAINING TILES, very suitable for land or field drainage, sewers &c. and well adapted for covering open ditches, as they form a very economical and strong lasting drain. Largest size, 15 inches by 12 inches diameter, about 2 inches thick, 10d. per foot run complete. Smaller size, 12 inches by 10 inches diameter, about 1½ inches thick, 8d. per foot run complete.



N.B.—A discount on taking a quantity.
Apply at Brunswick Wharf, Vauxhall, London.

GREAT REDUCTION IN PRICES.

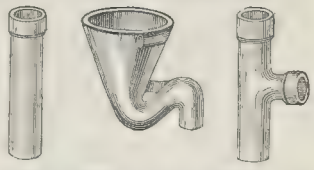
DRAWINGS AND PRICES MAY BE HAD OF J. COX, AS ABOVE.



REDUCTION IN PRICES.

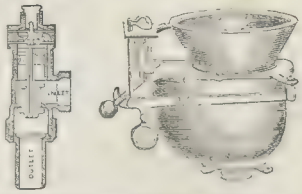
PATENT DRAIN-PIPES, UNGLAZED, manufactured by ARTHUR C. FRANCIS and CO. Grays, Essex. Sold by them, and by FRANCIS, BROTHERS, Nine-Elms, London, and at all their Warehouses.

PRICES				
3 inch bore, in 2 ft. 6 in. lengths, at				2½d. per foot.
4	"	"	"	3½d. "
6	"	"	"	5d. "
9	"	"	"	9d. "
12	"	"	"	1s. 3d. "
15	"	"	"	2s. 6d. "

These pipes are made under steam pressure, and burnt to great hardness, and are capable of bearing nearly double the hydraulic pressure of ordinary glazed pipes. The prejudice against red-ware is overcome by this manufacture, and it is well known that good earthenware, UNGLAZED, is the oldest material discovered in a perfect state in Rome, Babylon, Nineveh, &c. &c.

GREAT REDUCTION in the PRICE of STONEWARE POTTERY from this date.

VICTORIA POTTERY, LEIGH, near SOUTHEND; London Establishment, Falcon Wharf, Se Bankside. The new lists of prices will be forwarded on application as above. Feb 11, 1856.



WATER-CLOSET, with APPARATUS COMPLETE, for 12s. 6d.

CONSISTING OF

STAFFORDSHIRE BASIN AND TRAP,
Enamelled White Inside,
BRASS VALVE, &c.
MANUFACTURED AND SOLD BY
W. PATTEN, PATENTEE,
OLD FISH-STREET, near SAINT PAUL'S
LONDON.

LAMBERT'S PATENT WATER WASTE PREVENTER, and SELF-REGULATING VALVE-COCK, especially adapted for Water-closets.

FIG. 1. FIG. 2.

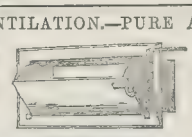
This Valve is so arranged, that whether it be held down or propped up, only a given quantity of water can be used at each action.

The pressure of the column of water—viz. its vertical height—being known, a quart, gallon, or any other quantity desired will be, and no more can be, discharged; and before the full quantity can be obtained, a second action must take place.

This Valve is capable of several modifications; one of its applications to the Pan Closet, as shown in Fig. 2, is the most important, as it renders useless nearly all other apparatus, and enables the discharge of water; it can be made to keep open as long or short a time as may be desired, after the handle which operated upon it is set free.

It is yet more valuable when applied to self-acting Closets, as it dispenses entirely with reservoirs or supply cisterns; once regulated, say for one gallon, that quantity will always be discharged at each action of the seat by its pressing upon the stud, or by any other movement.

The Patentees have tested them under every pressure up to 300 feet with complete success.

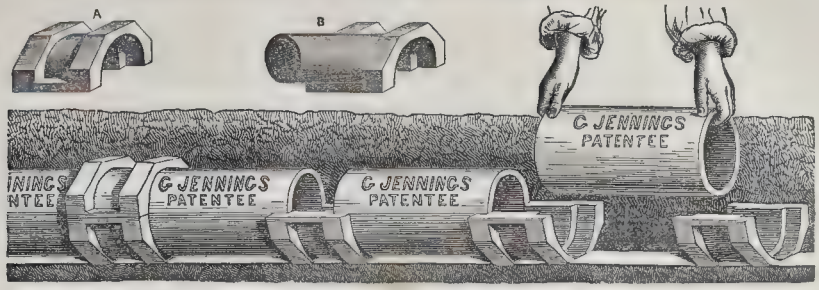


THOS. LAMBERT and SON,
Founders and Manufacturers of High pressure Water-Valves, Plumbers' Brass-work, Pumps, &c.
SHORT-STREET, NEW CUT, LONDON.

CLOSET BASINS, WHITE and BLUE URINALS, &c.

MANUFACTORY—MILLWALL.
DEPOT:
ARTHUR-STREET, NEW OXFORD-STREET.

CONTRACTORS' STEAM-ENGINES. — TO BE LET, on HIRE, or for SALE, several NEW and SECOND-HAND STEAM-ENGINES, of various powers, suitable for contractors' work generally. Apply to Messrs. SEDGWIN and HALL, Engineers, Surrey Iron Works, Blackfriars-road, where they may be seen.



VENTILATION.—PURE AIR.

With single pulley, from 6s. each; with leading pulley, from 8s. 6d.

These Ventilators are arranged that the requisite quantity of air may be admitted for the due ventilation of an apartment without the slightest draught being felt by the occupants; and as they are placed in the external wall, their action is not impeded when the house is closed for the evening, at which time a constant supply of fresh air is most required.—HAYWARD, BROTHERS, gole Manufacturers, &c., Blackfriars-road, and 117, Union-street, Borough, and of all respectable ironmongers, builders, &c.

JENNINGS'S PATENT DRAIN-PIPES.

THE PATENT CHAIRS AND SADDLES above shown are to a line of pipes the SAME SUPPORT AS SLEEPERS TO A LINE OF RAILWAY, the base of each Chair being BROAD and STRONG. The pipes are simple cylinders, of uniform thickness, made without the usual socket; the drying and burning, in consequence, is much more perfect. Pipes thus made and connected will be found to BEAR ANY PRESSURE, and are in no way liable to derangement. The laying of these pipes, and the making of the joints, IS DONE AT ONCE, EACH PIPE BEING BEDDED AS IT IS LAID, and the space between allows the workman to strike up the joint, and the superintendent TO SEE that every pipe is ACCURATELY LAID and PROPERLY JOINTED.

A shows one of JENNINGS'S PATENT SADDLES or COVERS, by means of which examinations are effected; B shows one of the PATENT JUNCTION COVERS, by which connections are made to finished lines of pipes, it being only necessary AT ANY TIME to remove a PLAIN Cover or Saddle, A, and substitute a Junction Cover, B, the Junction being THE SIZE of the Branch Pipe.

The favour with which these pipes have been received will no doubt give rise to many imitations, AS IT IS MUCH EASIER TO COPY THAN TO INVENT; but GEORGE JENNINGS hopes his sanitary patrons will give HIM CREDIT for being THE FIRST TO SHOW HOW JUNCTIONS MAY BE INTRODUCED, OR EXAMINATIONS MADE, TO FINISHED LINES OF PIPES. These important improvements, as above shown, are PATENTED; and GEORGE JENNINGS would caution those who desire TO PROFIT BY HIS IDEAS, NOT TO INFRINGE HIS PATENT RIGHTS, as they will not be allowed to do so with impunity, although he feels confident the ORIGINAL, for its SIMPLICITY and EFFICIENCY, will be preferred to the attempted Copy, the provisional specification of which was not proceeded with, although STILL CALLED PATENT.

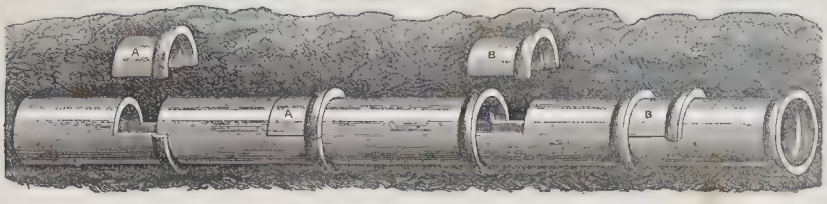
Prices of JENNINGS'S Drain Pipes, per foot run, including the Patent Chair and Saddle, are as follows:—4-inch, 6d.; 6-inch, 8d.; 9-inch, 1s. 1½d.; 12-inch, 1s. 10d.; 15-inch, 3s.; 18-inch, 4s.; with the usual discount to the Trade.

JENNINGS'S PATENT DOUBLE-SEATED VALVE-CLOSET.

Architects describing this Closet in their specifications will have a PERMANENTLY GOOD VALVE CLOSET, NOISELESS, and FREE FROM COMPLICATION. The Patentee has such confidence in its DURABILITY and EFFICIENCY, that he will guarantee every Closet for SEVEN YEARS.

JENNINGS'S IMPERISHABLE EARTHENWARE CLOSET AND TRAP.

This Closet has a large water surface, has no back to soil, is imperishable in its material, and the Trap and Closet are combined in one piece, suited alike for the PALACE or the COTTAGE.



JENNINGS'S IMPROVEMENTS IN LIFT AND OTHER PUMPS.

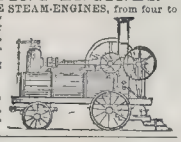
These Pumps would well repay a visit to Jennings's factory, where may be seen Jennings's Lavatories, Urinals, Sluice Valves, Fire and Steam Cocks, of every size; Shop-Shutter Shoes; Gully, Area, and Sink Traps, and other sanitary goods.

Or Illustrations and Prices can be had free by post, if two stamps are enclosed to

GEORGE JENNINGS, SANITARY ENGINEER, HOLLAND-STREET, BLACKFRIARS-ROAD, LONDON.

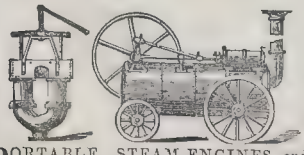
AYLESFORD POTTERY COMPANY'S PATENT DRAIN-PIPES.

THE above Company respectfully invites the attention of Engineers, Architects, Surveyors, Builders, &c. to an improved DRAIN-PIPE, whereby all stoppages may be cleared without disturbing the invert of the drain, by simply removing the cover (marked A or B) whichever may be preferred.



The cover (marked B) may be used in conjunction with whole or half-socket Pipes.
Pipes thus constructed may be laid at intervals in a drain of ordinary Socket-Pipes.
With the great advantage these Pipes offer, they are cheaper than any yet submitted to the public.

London Depôt—AYLESFORD WHARF, Belvedere-road, Lambeth.



MANUFACTORY AT AYLESFORD, NEAR MAIDSTONE, KENT.

STEAM PUMPING ENGINES.—PATENT PORTABLE STEAM-ENGINES, from four to ten-horse power, always ready to let on hire, by the week or month, for pumping, sawing, pile-driving, raising materials, &c. &c.

SALES BY AUCTION.

LIVERPOOL.—Valuable Property, in the immediate vicinity of the Lime-street Station of the London and North-Western Railway. By

MR. BRANCH, on FRIDAY, the 19th SEPTEMBER instant, at TWO o'clock in the afternoon, at the CLARENDON-ROOMS, South John-street, Liverpool, subject to conditions of sale to be then produced, by order of the trustees of the Second Wellington Building Society, the CEMENT WORKS, WAREHOUSE, and PREMISES, situate on the south side of Lord Nelson-street and east side of Hotham-street, in Liverpool, late in the occupation of Mr. G. H. Newton. The site of the premises contains in front to Lord Nelson-street 96 feet, when it turns off and runs to a southwardly direction, 13 feet 7 inches, when it again turns off and runs along Hotham-street, 35 feet, on the east side to a common passage of 3 feet wide, 51 feet, and on the south side 51 feet 3 inches, and contains 1,046 square yards, or thereabouts. The buildings have been recently erected in a very substantial manner, and are fitted up with a steam engine, and every requisite for carrying on an extensive trade; but they are equally of being converted into a dwelling, having been contemplated in their original construction), at a moderate expense and in a short time from the period that may be required. Immediate possession may be had. Title to be furnished of inheritance.—For further particulars, apply to Messrs. C. and J. ELLISON, 36, Renshaw-street; or to Mr. WILLIAM FOSTER, Solicitor, 40, North John-street, Liverpool.

TO ENGINEERS AND OTHERS.

MESSRS. FULLER and HORSEY are instructed by the Proprietor (who is retiring) to SELL by AUCTION, on the PREMISES, Herbert's-buildings, Waterloo-road, on TUESDAY, SEPTEMBER 23, and following days, at ELEVEN, in lots, without reserve, the MACHINERY, Tools, and Stock-in-Trade of a LATHE and TOOL MAKER (the tools principally by Smith, Beacock, and Tannett, of Leeds), including fourteen self-acting lathes, 15-inch and 10-inch screw-cutting, with 6 ft. 2 feet and 22 feet bed, seven screw-cutting, from 6½ inches to 8½ inches centre; four surfacing lathes, to take in surfaces from 4 feet to 7 feet diameter; two universal drilling engine and hand-turning lathes, with slides; five self-acting planing-machines, the largest to take in 3 feet wide and 13 feet long; three self-acting shaping-machines, three self-acting drilling-machines, slotting machine, screwing machine, wheel-cutting machine, oscillating steam-engine of 14-horse power, Cornish steam boiler, 18 feet long; 300 feet turned bright shafting, on 9 head motions, 3 iggers, straps, and driving gear; fifty vices, workbenches, horse planes and chisels, steel tools, stocks and dies, forges, smiths' tools, lloyd's iron, five tons of steel and sheet steel, ten tons of bar and rod iron, and numerous other effects.—To be viewed on Saturday and Monday previous to the sale, when catalogues may be had on the Premises; or of Messrs. FULLER and HORSEY, Billiter-street, City.

TO STONE MERCHANTS, CONTRACTORS, IRON-FOUNDERS, AND OTHERS.

MESSRS. FULLER and HORSEY, in conjunction with Messrs. PULLEN and SON, are instructed by the assignees of Mr. C. J. Mare, to SELL by AUCTION, at the KING'S ARMS HOTEL, Bridge-street, Westminster, on MONDAY, SEPTEMBER 29, 1856, at TWELVE o'clock, in lots, without reserve, 235 BLOCKS, Slabs, and Landings of Chesewring Granite, Bramley Fall and Bradford Stone, forty-three cast-iron girders, and 150 large Portland Cement, supplied for the construction of the new bridge, at Westminster, and now not required by the commissioners.—To view, and for permission, at the Bridge Works, Stangate, on Friday and Saturday previous to the sale. Catalogues may be had at the King's Arms, Bridge-street, Westminster; of Messrs. PULLEN and SON, 80, Fore-street; and of Messrs. FULLER and HORSEY, Billiter-street, City.

Highly-finished Condensing Steam Engine, 30-inch Cylinder, 9-feet stroke, by Naylor, Vickers, and Co., Sheffield.

MESSRS. FULLER and HORSEY are instructed by the First Commissioner of her Majesty's Board of Works, to SELL by AUCTION, at HERBERT'S-BUILDINGS, Waterloo-road, on WEDNESDAY, SEPTEMBER 24, at ELEVEN, a highly-finished direct acting, CONDENSING STEAM ENGINE, by Naylor, Vickers, and Co., 30-inch cylinder, 9-feet stroke, D slide-valve, throttle-valve and governors, air-pump and two feed pumps, with solid gun-metal eccentric, bright wrought-iron connecting-rod, and complete set of apparatus, made for the Houses of Parliament.—To be viewed on Tuesday previous to the sale, when catalogues may be had on the Premises; and of Messrs. FULLER and HORSEY, Billiter-street, City.

TO BUILDERS, IRONMONGERS, STOVE-GRATE MAKERS AND OTHERS.

MESSRS. FULLER and HORSEY are instructed to SELL by AUCTION, on TUESDAY, OCTOBER 7th, 1856 and following days, at ELEVEN o'clock each day, at the WAREHOUSES, Bell-Savage-yard, Ludgate-hill, in lots, without reserve, the extensive STOCK of the Sheffield Company's Stove Grate and General Ironmongery Warehouse, all of the newest patterns and designs, including 1,000 polished steel register stoves, with ormolu mounts, 350 black register and Romford stoves, 20 wind-up ranges, 20 cottagers' cooking stoves, 30 hall and shop stoves, 50 steel fenders, with ormolu mounts, 2,000 brass and black fenders, 200 sets fire-irons, bronzed umbrella-stands, hat-stands, garden chairs and tables, an assortment of elegant Berlin bronzes, in groups of horses, in stag, in medelli us, &c.; 2-barrel cotton rollers, 20 round and oval fly-fishing-reels, 5 yards ram-water pipe and guttering, 2 tons stove and range metal, air-bricks, dampers, and frames, an assortment of builders' ironmongery, in locks, nails, hinges, screws, bolts, pulleys, &c.; furnishing ironmongery, japanned goods, black roller ware, 50 dozen frying-pans, electro-plated goods, iron and papier maché trays, coal vases and scoops, toilet sets, 30 gas chandeliers, 300 ship cabin and entrance lamps, 2 dozen pairs 2-feet globes, 50 improved reflecting telescopes, 2 gross patent pen guards, fittings and tools of smith's shop, standard scales and weights, counting-house fittings, and other effects.—To be viewed on Saturday and Monday previous to the sale, when catalogues may be had on the Premises, and of Messrs. FULLER and HORSEY, Billiter-street, City.

IMPORTANT WATER-SIDE PROPERTY, ON THE THAMES, IN THE CITY OF LONDON.

MESSRS. FULLER and HORSEY are instructed by William Crawshay, Esq. to SELL by AUCTION, on WEDNESDAY, OCTOBER 1st, at TWELVE, at the MART (unless previously disposed of by private contract), the splendid MERCANTILE PROPERTY, held under the Corporation of London, known as George-yard, Upper Thames-street, City of London, having a frontage next the Thames of 133 feet, and occupying a superficial area of about 34,000 square feet, a site unrivalled in the metropolis, either as a depôt for landing and housing goods or for carrying on any wholesale business for which extensive water-side premises are desirable. George-yard is universally known as the London establishment of Mr. Crawshay, the ironmaster, and has been in the occupation of himself and predecessors for more than a century. The trade carried on ranks among the first in the City, the premises having very lately been fitted up to carry on the premises for the same business, a large proportion of the connexion may be obtained. In the year 1852 the owner expended many thousands of pounds in the erection of a massive pile of buildings, 160 feet in length by 65 feet in width, abutting on to the river; the structure is of the most substantial character, and, if needed for the purpose of warehousing goods, the foundation and walls are quite equal to support an elevation of several stories above those already erected. The building is one lofty ground-floor, with arches and piers to carry the iron columns, and constructed to carry any weight. There is also a stack of warehouses, abutting on the river, 75 feet in length, of two floors, and a stack of warehouses, 60 feet in length, of three floors, abutting on Thames-street. A commodious dwelling-house in the yard, the lower part occupied as offices for clerks and principals. A comfortable dwelling-house fronting Thames-street. Extensive paved yards, with two separate entrances, affording every convenience for loading and drawing goods. The whole held on lease from the Corporation of London, for a term which will expire in the year 1900, subject to the rent of 1,200l. per annum. A stack of warehouses adjoining, of three floors, with frontage of 132 feet in Castle yard, may be added if desired, at a rent of 150l. per annum. To be viewed till the sale. Printed particulars and plans will shortly be ready, and may be obtained at the Mart; of Messrs. CROWDER and MAYNARD, Solicitors, 37, Coleman-street; and of Messrs. FULLER and HORSEY, Billiter street, London.

SALES BY AUCTION.

PRELIMINARY ANNOUNCEMENT.

MESSRS. FULLER and HORSEY in conjunction with Messrs. PULLEN and SON, are instructed by the Assignees of Mr. C. J. Mare, to SELL by AUCTION in the ENSUING MONTH, the whole of the LOOSE STORES and TOOLS of the extensive ship-building yards and iron-works at Blackwall and West Ham, including upwards of 1,000 tons of wrought iron, in bars, rods, plates, scrap, blooms, and puddled bars; 100 tons rivets, 100 tons screwed bolts and nuts, 50 tons cast and wrought steel, 70 tons cast iron; 20 tons engineers' steel stocks, an expensive self-acting boring bar, rat-het braces, stocks, taps and dies, &c.; 100 wrought-iron anvils, 30 tons smiths' tools, 20 tons metal hearths of large planks and deals, moukers, &c; 200 tons iron flasks, crane shank and band ladles, flask weights, several washing machines, brass fitters' and finishers' tools, blacksmiths' tools, 150 tons shaping-upwards and blocks, patent twisting machine, contractors a portable steam-engine and boiler, three Cornish a cam-boilers, crab cranes blocks and falls, many tons of chain slings, mooring-chains, cream-cables, &c.; 50 brass barrel lift pumps, ships' water-closets, ships' pumps, five tons brass fittings, a large assortment of general ironmongery, 1,000 dozen files, 100 joiners' benches, joiner's cramp and tools, 10 tons iron, plumbers' tools, five tons bolt and sheathing copper, 50 oak trees, several hundred fathoms slab, expensive prepared cabin fittings, several thousands of stage planks and deals, shipwrights' tools, 20 barges and skiffs, three wrought-iron barges, counting-house fittings and a large assortment of miscellaneous effects. More detailed advertisements will shortly appear. Catalogues are being prepared, and may shortly be obtained, at one shilling each of Messrs. PULLEN and SON, 80, Fore-street; or of Messrs. FULLER and HORSEY, Billiter-street, City.

VICTORIA-STREET, WESTMINSTER. SECOND PORTION.—Sale of new Building Materials, Plant, Stock, and Utensils of a Builder.

MESSRS. FULLER and HORSEY are instructed to SELL by AUCTION, on TUESDAY, the 30th of SEPTEMBER, and following days, at ELEVEN o'clock each day, on the PREMISES, Victoria-road, Westminster, in lots (without reserve), the SECOND PORTION of the STOCK of well-seasoned NEW BUILDING MATERIALS, partly prepared, yellow and white deal flooring boards, 500 feet cube Portland stone, 5,000 feet 3-inch tooled York paving, 5,000 feet red and other paving, 2,000 feet York landings, 350 feet cube York stone, 1,700 feet cube granite, two tons iron girders, 50,000 stock and fire-bricks, 400 yards coal iron rain-water pipe, 10 slate cisterns, 20 baths, Peggs stoves, 30 coils iron pipe, 8 galvanized tanks, 10,000 feet iron tube, an assortment of T's, elbows, bends, sockets, &c. plus basins, 50 gallons varnishes, 30 cwt. red and white lead, and colours; 200 pieces paper-hangings, &c. The plant and tools include 7 hoisting machines and chains, mortar mill, sweeping machine, 5 stone trucks, 7 asphalte pots, crab cranes, blocks and falls, 2,000 scaffold boards, 1,000 scaffold poles, 10 to 40 feet; 1,000 feet run 3-inch plank, 500 dozen scaffold cords, 60 ladders, 20 benches, barrows, 6 brass finishers' lathes, smiths' forges, vices, anvils, benches, air furnace, moulding trough, and tongs, 2 painters' machines, 24 pair steps and trestles; an assortment of boxes, stocks and dies, steel tools, and numerous other effects.—To be viewed two days previous to the sale when catalogues may be had on the Premises; and of Messrs. FULLER and HORSEY, Billiter-street.

PRELIMINARY ANNOUNCEMENT.

MESSRS. FULLER and HORSEY, in conjunction with Messrs. PULLEN and SON, are instructed by the Assignees of Mr. C. J. MARE, to SELL by AUCTION, in the ensuing month, at the WORKS, Blackwall, a Pair of highly-finished, oscillating Marine ENGINES, equal to 350 horses' power; eight new tubular marine boilers; the castings for a second pair of oscillating marine engines; two new tubular marine boilers, with brass tubes; two new wrought-iron boats, and other similar property, more detailed advertisements of which will shortly appear.—To be viewed, and Messrs. PULLEN and SON, 80, Fore-street; or to Messrs. FULLER and HORSEY, Billiter-street, City.

TO MARBLE MASONS, BUILDERS, SCULPTORS, AND OTHERS.

MESSRS. EVERSFIELD and HORNE beg to announce that they are instructed by the consignees to SELL by AUCTION, at the MARBLE WHARF, No. 17, Millbank-street, Westminster, on WEDNESDAY, SEPTEMBER 17, 1856, at ELEVEN o'clock, a valuable PARCEL of MARBLE, comprising Statuary, Vein, Sicilian, Black and Gold, Black, and Bardilla, in blocks and scantling of large dimension.—Approved bills of six months will be taken in payment.—May be viewed, and catalogues had at the place of Sale, and of the Auctioneers, 40, Parliament-street, Westminster; or Coal Exchange.

TO STONEMASONS, BUILDERS, CONTRACTORS, and OTHERS.—400 Tons Bramley Fall, and Caen Stone, in blocks, to be SOLD by AUCTION, by

MR. SITGRAVE, on TUESDAY, SEPTEMBER 16th, at ONE o'clock precisely, on the PREMISES, Devon Wharf (near new Globe-bridge), Mile-end, by direction of the proprietors, 200 blocks, containing 1,000 feet of PORTLAND, BRAMLEY FALL, and CAEN STONE, of the finest quality, and chiefly of large dimensions and lengths, up to 12 feet, suitable for building steps, and other building purposes. Also, 10,000 feet of sawn Hare-hill and Potter Newton Slab, now lying on the bank of the Regent's Canal, with every facility for water and land carriage.—May be viewed the day prior to the sale, and catalogues had on the Premises; and of the Auctioneer, at his Offices, 23, Leadenhall-street; or will be forwarded per post on application.

Surplus Property of the South-Eastern Railway Company, at Hastings, Sussex.

MR. MARSH has received instructions from the Directors of the South-Eastern Railway Company to SELL by AUCTION, at the SWAN HOTEL, Hastings, on TUESDAY next, SEPTEMBER 16th, at TWO for THREE o'clock, SIXTY-TWO PLOTS of valuable BUILDING GROUND, situate adjoining the town of Hastings and the Railway Station; presenting very admirable sites for the erection of shops or private residences, and offering votes for the county of Sussex.—May be viewed, and particulars, with conditions of sale, obtained at the several Railway Stations; of Mr EDWARD RYDE, Surveyor to the Company, Cannon-bridge Terminus; and at Mr. MARSH's Offices, 2, Charlotte-row, Mansion-house, London; or will be forwarded on application.

TO TIMBER MERCHANTS, BUILDERS, PACKING-CASE MAKERS, and OTHERS.—Messrs. Robinson and Bartram's Sawmills, Swan-street, Grange-road, Bermondsey.

MR. PEAKE is directed by the Executors of Thomas Elliston, Esq. Timber Merchant, deceased, to SELL by AUCTION, at the SAW-MILLS, as above, on TUESDAY, SEPTEMBER 16th, 1856, at TWELVE for ONE, in lots, the last portion of his STOCK, comprising a large quantity of dry planks, deals, and battens.—May be viewed the day previous and morning of sale. Catalogues obtained on the Premises; and at Mr. PEAKE'S Offices, 44, Tooley-street.

TO BUILDERS, AGRICULTURISTS, WHEELWRIGHTS, COOPERS, and OTHERS Saffron Walden, Essex.—TO BE SOLD by AUCTION, by

MESSRS. NOCKOLDS and KING, upon the PREMISES (late in the occupation of Mr. William Ward, deceased), on TUESDAY and WEDNESDAY, the 23rd and 24th days of SEPTEMBER, 1856, and following days, the BUILDER'S STOCK-IN-TRADE, comprising a large quantity of well-seasoned oak, ash, elm, beech, lime, willow, chestnut, walnut, and maple plank; oak, elm, and deal boards; and flooring; deals, pines, yellow battens, tiling and rough cast lath, wheelwrights' and coopers' stuff, six capital five barred oak gates, shop-fittings, building materials, and numerous timber trees of excellent quality and large dimensions, sixty ash, beech, larch, and other trees, a large quantity of building stones and road sand, stonemasons' stock, comprising three handsome Portland tombs (complete), tomb stone, &c.; plain tiles, building bricks, the materials of a shed covered with pantiles, 54 feet long by 12 feet wide; large quantity of old sounding and firewood; also a neat gig on patent axles, in good condition.—May be viewed on the Monday previous to the sale, and catalogues had at the George, Bishop Stortford; Red Lion, Cambridge; upon the Premises; and of the Auctioneers, Saffron Walden, Essex.

SALES BY AUCTION.

HARROW, MIDDLESEX.—Valuable Freehold Building Land, situate midway between the church and the station.

MESSRS. FAREBROTHER, CLARK, and LAYE are instructed to SELL, at GARRAWAY'S, on WEDNESDAY, OCTOBER 8, a valuable FREEHOLD PROPERTY, close to Harrow-on-the-Hill, and about midway between the church and the station, and only a few yards' remove from the high-road, beautifully situate, commanding extensive views over the surrounding picturesque country, divided into three lots, as under, viz.:—Lot 1. A desirable plot of ground, as staked out, and abutting on the Roxburgh-road, and having a frontage thereto of 300 feet, and extending in the rear to a depth of about 500 feet, part having a frontage of 307 feet to the Byron road. Lot 2. A corner plot, situate at the junction of the Roxburgh and Byron roads, with by frontages, of 115 feet to the former, and 183 feet to the latter. Lot 3. Another valuable plot, having a frontage of 253 feet to the Byron-road. The above property forms a portion of a larger estate, recently disposed of for building purposes. The roads are laid out, tasteful villas have been erected on the adjoining plots, and some others are in progress. The proximity of the railway station, combined with the benefits extended by the North-Western Railway Company to occupants of houses in the vicinity, coupled with the advantages of Harrow School, render this a most desirable property for the erection of villa residences. May be viewed; and particulars, with plans, may be had at the King's Head Inn, Harrow; the Railway Hotel, at the station; of THOMAS WOOSTER, Esq. Solicitor, 18, Skinner-street, Snow-hill; at Garraway's; and at the Offices of Messrs. FAREBROTHER, CLARK and LYE, Lancaster-place, Strand.

SALE of MAHOGANY, &c. at LIVERPOOL.

The next Liverpool Periodical Auction Sales, comprising Two Cargoes City St. Domingo, One Cargo St. Domingo, and 400 Logs Cuba Mahogany, with Red wood, Walnut Maple, and other Furniture Woods, &c. will take place on WEDNESDAY MORNING, the 24th SEPTEMBER, 1856, at ELEVEN o'clock precisely, in the WOOD SALES SHEDS, Brunswick and Toxteth Docks.—Catalogues containing full descriptive particulars may be seen at the Office of this Paper, or may be had on application to EDWARD CHALONER, Wood Broker and Measurer, No. 6, East Side, Queen's Dock, Liverpool.

VALUABLE RESIDENTIAL INVESTMENTS

MESSRS. BEADEL and SONS have received instructions to SELL, by AUCTION, at the MART, Bucklersbury, London, on TUESDAY, the 7th day of OCTOBER, 1856, at TWELVE o'clock, in Eight Lots, the following RESIDENCES and SHOPS:—Lot 1 will comprise a Freehold Residence, No. 3, Swallow-street, Gray's-inn-road, in the occupation of Mr. Thomas Malby.—Lots 2 and 6 will include Sixteen Leasehold Residences, in Upper Stamford-street, Blackfriars-road, held on long unexpired terms, at moderate ground-rents, and let to respectable tenants.—Lot 7. A Leasehold House, with Wheel Factory, No. 29, Bridge House place, Newington-causeway, sub-let to Mr. William Tinker.—Lot 8. Two Leasehold Houses and Shops, Nos. 2 and 3, Portland place, in the occupation of Messrs. Mantle and Thomas, the whole producing a rental of about 1,000l. per annum.—Particulars and conditions of sale may be obtained of Messrs. R. Sutton and Son, Solicitors, 33, Holborn; at the Auction Mart; and of Messrs. BEADEL and SONS, 25, Gresham-street, London.

COLCHESTER.—Freehold Building Land.

MESSRS. BEADEL and SONS have received instructions to SELL by AUCTION, at the CUPS HOTEL, Colchester, on THURSDAY, the 16th day of OCTOBER, 1856, at TWO for THREE o'clock, in six lots, several valuable PLOTS of FREEHOLD BUILDING LAND, situate close to the railway station at Colchester, possessing considerable frontages to North-street, and the roads leading from Colchester to Sudbury and Ipswich, which will be sold with no restrictions as to building, also a few lots close to St. James's Church, on the East-hill fronting Castle-road and Garden-terrace. The above property is freehold, land-tax redeemed, chiefly tithe free, most eligibly situate, and well adapted for the erection of villas, or other residences, and offers votes for the county of Essex.—Particulars, with lithographic plans, may be obtained of Robert Rossiter, Esq. Solicitor, 29, Coleman-street, London; at the Cups Hotel, Colchester; and of Messrs. BEADEL and SONS, 25, Gresham-street, London.

IN BANKRUPTCY.

MR. ALFRED DAY has received instructions from the assignees of Messrs. Rowland and Evans, bankrupts, to SELL by AUCTION, on the PREMISES, Arlington-street, New North-road, Islington, on TUESDAY, the 23rd of SEPTEMBER, 1856, at TWELVE o'clock without reserve, the third portion of the extensive STOCK and UTENSILS of a Builder, comprising 300 scaffold boards, 1,000 putlocks, 20 long ladders, wheeling planks, 1,000 scaffold poles, three powerful crabs, sticks of timber, erection of forge, troughs, blocks, stables, bellows, vices, filing-machine, benches, scales, weights, smiths' tools, quantity of wrought and bar iron, rod ditto, gratings, iron frames, stoves, &c.; slate landings, Caen, Bath, Portland, York, and Kentish rag, in blocks and landings; fire bricks, pantiles, sheds, and other effects. May be viewed on the Saturday and Monday preceding the sale. Catalogues to be had of Messrs. Hands and Pullen, 16, Gresham-street, City; J. Nicholson, Esq. Official Assignee, 24, Basinghall-street, City; and of the Auctioneer, City-road, near the Eagle Tavern.

TO ENGINEERS, INDIA-RUBBER MANUFACTURERS, and Others.—Barne's Cray, Crayford.—Machinery, Plant, Stock, &c. at the Leading Corn Flour Factory, near Crayford, Kent.

MR. T. DANN will SELL by AUCTION, on the PREMISES, on FRIDAY, the 19th of SEPTEMBER, at TWELVE, TWO capital STEAM ENGINES, with shafts and gear complete (one of 16 and the other of 8 horse-power), two thread and three tape machines (nearly new), two cleansing machines, two mast-rafters, cutting machine, steam-pans, cylinders, spreading-mach ne, naphtha-still, clothes-frames, turning-lathes, a set of Silk Colour Cards, Dartford; of Mr. G. BEADLE, House Agent, Erith; at the principal Inns in the neighbourhood; and of the Auctioneer, Bexley, Kent.

N.B. The Proprietor of the Vendors is in the Premises to be Sold by Private Contract. Particulars of the Auctioneer, &c.

RED HILL, near REIGATE.—TO BUILDERS, BUILDING SOCIETIES, and OTHERS.

MR. ORPWOOD will SELL by AUCTION, at the MART, on WEDNESDAY, SEPTEMBER 17, at TWELVE, TWO unfinished six-roomed HOUSES, with shops and garden ground, near the Royal Oak Tavern, in High-street, facing towards the Station.—Printed particulars at the Royal Oak; Messrs. KING and SHEPPARD'S Offices, North-buildings, Finsbury; Mr. ORPWOOD'S, Artillery-place, Finsbury; and Mart.

BUILDER'S STOCK.—WALTHAM ABBEY.

MR. C. PRYOR is instructed by the Executrix of the late Mr. H. Phillips, Builder and Undertaker, to SELL by PUBLIC AUCTION, on the PREMISES, on TUESDAY, SEPTEMBER 16, at TEN for ELEVEN, 50 feet PLANK, of oak, chestnut, acacia, pine, and maple; deals and battens; 1,000 feet deal board; elm board; posts, pales, tops and slabs, nails and spikes, iron and brass work. The utensils include two and weight-lever vans carts, wheels, ladders, and harness; also oak, ash, and elm timber trees and other effects.—May be viewed, and catalogues had on the Premises, and at C. PRYOR'S Offices, 18, Smithfield bars, and at Waltham Abbey.

LONDON: Printed by CHARLES WYMAN, of 13, Hunter street, Brunswick-square, in the Parish of St. George, Bloomsbury, Printer, at the Printing-office of COX (Bros.) & WYMAN, 74 & 75, Great Queen-street, Lincoln's-inn-fields, in the Parish of St. Giles-in-the-Fields, and published by the said CHARLES WYMAN, at the Office of "THE BUILDER," 1, York-street, in the Parish of St. Paul, Covent Garden, all in the County of Middlesex.—Saturday, September 13, 1856.

TO ARCHITECTS, ENGINEERS, SURVEYORS, AND BUILDERS.

PROFESSOR DONALDSON'S COURSES of LECTURES on ARCHITECTURE and CONSTRUCTION, at University College, for the Session 1856-57, will commence on Tuesday, the 21st October. The circular and terms can be had at the College Office.

TO the MEMBERS of the METROPOLITAN BOARD of WORKS.

GENTLEMEN,—The District of St. Mary, Newington, &c. &c. being vacant by the death of Mr. George Porter, I beg leave to make application for that office.

You are aware that, by a recent decision of the Lords of the Treasury, I am entitled to an annuity of 105l. 13s. 4d. payable out of the funds raised from the rates at your disposal. You are also aware that this is not my first application for the office of District Surveyor.

Should you do me the honour to propose to appoint me to the vacant district, on the condition that payment of my compensation should stop during the time I hold the office, I, on my part, should fulfilnough not barred by the statute) be prepared to accept the office on such condition.

My certificate of qualification was laid before you on a previous occasion, and still lies in your office.

Some very urgent and important business will, I fear, prevent my calling upon you to make personal application for your votes.

I am, Gentlemen, your obedient Servant,
EDWARD WARD LOVER
(Late Surveyor to the Office of Metropolitan Buildings).
Clapham, Sept. 11, 1856.

SURVEYOR WANTED. — WEST HAM LOCAL BOARD of HEALTH.—Notice is hereby given, that the Local Board of Health for the District of West Ham, in the county of Essex, require a fit and competent Person to execute the duties of a SURVEYOR under the Public Health Act, within the said district. He must possess a thorough and practical acquaintance with works of drainage, sewerage, roadmaking, and paving. He must be competent to take levels, to prepare plans, sections, drawings, and estimates, and to superintend the execution of all works of the description referred to, or which may fall within the duties of the Office of Surveyor under the Public Health Act, or the Bye-Laws of the Local Board. He will be required to superintend the public lighting of the district when under the Management of the Local Board, and see to the execution of their Contracts in reference thereto. The officer will be required to reside in the district, and devote the whole of his time to the service of the Local Board. He will therefore be restricted from taking private business. His salary will be 300l. per annum, with the free use of offices. Any further information respecting the duties of the office, may be obtained on application to the Clerk of the Local Board. Candidates must send written applications for the office, with recent testimonials of qualifications and competency, and with particulars of age and previous occupation; and all applications must be sent to me, endorsed "Application for the office of Surveyor," on or before MONDAY, the 29th instant. Such of the candidates as may be deemed by the Local Board eligible for the Office (but no others), will be required to attend on the day of Election, of which, and of the hour and place, they will be duly informed.—By order of the Local Board,
W. J. BARSHAM, Clerk.
Rokeby House, Stratford, Essex, Sept. 15, 1856.

TO SURVEYORS and OTHERS.—PREMIUMS for PLANS.—The Trustees for Sale of a Freehold Estate of 500 acres, including the Beulah Spa, and near the Crystal Palace, require PLANS for LAYING OUT the same for building purposes, showing the necessary roads, sewers, &c. the whole to be clearly defined and apportioned in suitable lots, and laid down to a scale of two chains to one inch, from actual admeasurement. The following premiums are offered:—For the plan adjudged the best by the trustees, 150 guineas; for the second, 100 guineas; for the third 50 guineas. The plans to which the above premiums shall be awarded will be retained by, and be the property of, the trustees.—Further particulars may be obtained of Mr. PEACOCK, Builder, near the Jolly Sailor Station, Norwood, close to the property. The Trustees will meet on the 5th day of DECEMBER next, to examine the plans, which are to be previously forwarded, enclosed and sealed, to the Secretary's Office, Auction Mart, London, addressed to the Trustees of the White Horse, Norwood Estate.

TO SURVEYORS. — NOTICE. — NORWOOD, BEULAH SPA ESTATE, near the Crystal Palace. It having been intimated to the Trustees that the time mentioned for the Delivery of the Plans is insufficient, they have determined to EXTEND the same to MONDAY, DECEMBER 8, at the same place.

WELLINGTON MONUMENT.—The Commissioners of her Majesty's Works and Public Buildings give Notice, that it is the intention of her Majesty's Government to ERECT a MONUMENT in St. Paul's Cathedral, London, to the memory of the late Duke of Wellington, and that the Commissioners are prepared to receive DESIGNS for the same from artists of all countries. A drawing, showing the ground plan of the cathedral and the site of the proposed monument, together with a statement of the premiums, and other particulars, will be forwarded to artists on application by letter, addressed to me at this Office.
ALFRED AUSTIN, Secretary.
Office of her Majesty's Works and Public Buildings, Whitehall, London, September 6th, 1856.

CONTRACTS.

TO BUILDERS and CONTRACTORS.—Notice is hereby given, that the receipt of Tenders for Works at Tourville, Alderney, which was advertised to be received by the Director-general of Contracts, War Department, Pall-mall, London, on the 30th instant, is POSTPONED until the 31st of OCTOBER, 1856.
War Department, Pall-mall, London,
Sept. 16, 1856.

NOTICE to CONTRACTORS and BUILDERS.—The Commanding Royal Engineer of the Dover District hereby gives Notice, that the WORKS proposed to be performed to the FORTIFICATIONS at DOVER CASTLE, and for the execution of which Tenders were called for, are POSTPONED.
Royal Engineer's Office, Dover, September 17, 1856.

NOTICE to BUILDERS and CONTRACTORS.—The Commanding Royal Engineer at Guernsey, hereby gives Notice, that sealed TENDERS will be received by the Director-General of Contracts, War Department, Pall-mall, London, until TUESDAY, the 23rd of SEPTEMBER, 1856, for CONSTRUCTING a small BATTERY, ERECTING BARRACK BUILDINGS, with enclosure walls, &c. and FORMING DITCHES, GLACIS, and ROAD, at HOMMET POINT, in the Island of Guernsey. Detailed drawings of the work may be seen, and every requisite information obtained, on application at the Royal Engineer Office, Guernsey, every day (Sundays excepted), between the hours of NINE and FOUR. The terms of contract, specification for the works, and forms of Tender, may be procured at the Director-General of Fortifications' Office, War Department, Pall-Mall, London, as well as at the Royal Engineer Office, Guernsey. Each Tender to be in one lump sum, in British sterling, for the whole work, to be attached to a copy of the terms of contract and specification, addressed to "The Director-General of Contracts, War Department, Pall-Mall, London," and endorsed, "Tender for Works at Hommet, Guernsey." The War Department reserve the right of rejecting any or all of the Tenders.
Royal Engineer Office, Guernsey, August 27, 1856.

NOTICE to BUILDERS and CONTRACTORS.—The Commanding Royal Engineer at Guernsey hereby gives Notice, that sealed TENDERS will be received by the Director-General of Contracts, War Department, Pall-mall, London, until WEDNESDAY, the 8th of OCTOBER, 1856, for CONSTRUCTING a BATTERY and BARRACK BUILDINGS at Le Crocy, in the Island of Guernsey. The plans, specifications, conditions of contract, and form of Tender may be seen, and all other information obtained, on application at this Office, every day, Sundays excepted, between the hours of TEN and FOUR, from the 19th to the 30th inst. the whole of the work to be completed within eight calendar months from the date of notification of acceptance of Tender. The Tender to be in one lump sum in British sterling, for the whole work, to be attached to a copy of the terms of contract and specification, addressed to "The Director-General of Contracts, War Department, Pall-Mall, London," and endorsed "Tender for Works at Le Crocy, Guernsey." The War Department reserve to themselves the right of rejecting the whole or any of the Tenders.
Royal Engineer Office, Guernsey, 8th September, 1856.

NOTICE to BUILDERS and CONTRACTORS—WAR DEPARTMENT WORKS.—The Commanding Royal Engineer at Guernsey gives notice that TENDERS for the ERECTION of a FORT and BARRACK BUILDINGS, on Richmond hill, Guernsey, will be received by the Director-General of Contracts, War Department, Pall-mall, London, on or before SATURDAY, the 27th day of SEPTEMBER instant, after which date no Tender will be received. Detailed drawings may be seen, and every requisite information obtained, at the Royal Engineer Office, Guernsey, on and after the 16th instant. Tenders for the above work to be on forms furnished from the Royal Engineer Office, Guernsey, and to be addressed to "The Director-General of Contracts, War Department, Pall-mall, London," and endorsed "Tender for Erecting a Fort and Barrack at Richmond-hill, Guernsey."
N.B.—The War Department reserve the right of rejecting any or the whole of the Tenders.
Royal Engineer Office, Guernsey, August 30, 1856.

TO BUILDERS.—Sealed TENDERS for BUILDING NEW BARRACKS for non-commissioned officers and married soldiers, at Devonport, including all requisite Fitments; also, separate Tenders for the Asphalte Work required for same, will be received at the War Department, Pall-Mall, London, on or before TUESDAY, the 30th of SEPTEMBER next, at NOON, addressed "To the Director-General of Contracts," and endorsed "Tender for Married Soldiers' Barracks, Devonport," or "Asphalte Work for Married Soldiers' Barracks, Devonport," (as the case may be), on the left-hand corner of the envelope. The barrack comprises—three blocks of two-story buildings, laundry, cook-houses, outbuildings, sail-pits, enclosure walls, gates, footpaths, roads, and parade.

Plans and specifications, with terms and conditions, may be seen, and forms for Tenders and every information obtained at the Royal Engineer's Office at Devonport, between the hours of NINE and FOUR o'clock on week-days, from MONDAY, the 15th, to SATURDAY, the 27th SEPTEMBER next, both days inclusive.
Royal Engineer's Office, Devonport, Sept. 3, 1856.

CONTRACTS.

NOTICE to STONE-MERCHANTS, CONTRACTORS, and OTHERS—ROYAL ENGINEER CONTRACT.—The War Department being about to enter into a CONTRACT for REPAIRS to ROADS, &c. of the Royal Artillery Barracks at Woolwich, such persons as may be desirous of tendering for the same, may inspect the specification, and receive all necessary information relative thereto, by applying to Mr. BARTWRIGHT, Clerk of Works, at the Royal Engineer Office, Grand Depôt, Woolwich, between the hours of TEN a.m. and FOUR p.m. up to the 2nd of OCTOBER, 1856. Tenders to be delivered at the Office of the Director-General of Contracts, War Department, Pall-mall, London, on the 4th of OCTOBER, 1856. The War Department reserves to itself the right of rejecting the whole or any of the Tenders.
Grand Depôt, Woolwich, 13th Sept. 1856.

TO BUILDERS and CONTRACTORS.—Notice is hereby given, that TENDERS will be received by the Director-General of Contracts, War Department, Pall-mall, London, on or before SATURDAY, the 4th day of OCTOBER, 1856, from persons desirous of CONTRACTING with the War Department for ERECTING certain BLOCKS of BUILDINGS for the accommodation of married non-commissioned officers and soldiers of the Royal Sappers and Miners, near Brompton Barracks, Chatham. Plans may be seen, and specifications and forms of Tender obtained, on application at the Royal Engineer Office Chatham, between the hours of TEN and FOUR, till the 3rd of OCTOBER next. Sundays excepted. The person whose Tender may be accepted will be required to enter into a bond, with two eligible securities, jointly and separately, to be bound under a penalty of 1,500l. for the due performance of the Contract. Tenders to be addressed to "The Director-General of Contracts, War Department, Pall-mall, London," and to be delivered free, endorsed, "Tender for Works at Brompton Barracks, Chatham." No Tender can be admitted after the said 4th day of OCTOBER, 1856.
N.B.—The War Department reserve to themselves the right of rejecting the whole or any of the Tenders.
Royal Engineer Office, Chatham, 16th September, 1856.

TO DEALERS in BUILDING MATERIALS and OTHERS.—TENDERS are required by the Principal and Auditors of the Honourable Society of Saint Clement's Inn, for the PURCHASE and REMOVAL of the old MATERIALS comprised in the buildings belonging to them, being No. 8, St. Clement's-Inn, Strand. Particulars and conditions, &c. may be obtained on application at the Office of Mr. THOMAS GREGORY, the Steward, No. 13; and of Mr. BLACKBURNE, the Architect to the Society, No. 16, on and after SATURDAY, the 20th day of SEPTEMBER next. The Principal and Auditors reserve to themselves the right of rejecting, at their option, the whole or any of the Tenders.

CONTRACT.—ST. GEORGE the MARTYR, SOUTHWARK.—The Vestry of the above parish are desirous of receiving TENDERS from persons who are willing to Contract for REMOVING the DUST, ASHES, DIRT, RUBBISH, DECAYED VEGETABLES, ICE, SNOW, FILTH, and all REFUSE MATTER from the houses throughout this parish; and also for CARTING away the SLOP and STREET SWEEPINGS, when collected and swept up by the labourers of the Vestry, and the employment of proper slop and other carts, horses, and drivers for such purposes, from the 30th day of SEPTEMBER instant, for six or twelve months, at the option of the said Vestry. Such Tenders, with the names of two responsible parties, to be sent in to the Clerk's Office, on or before TWELVE o'clock at noon of MONDAY next, the 22nd day of SEPTEMBER, endorsed what the Tender is for.

The Vestry will not bind itself to accept the lowest or any Tender. No Tender will be accepted unless accompanied by a deposit of 5l. to be returned in the event of the Tender being accepted. All persons Tendering are desired personally to be present at the meeting of the Vestry, on MONDAY, the 22nd SEPTEMBER inst. at half past SEVEN o'clock in the evening, exact time in the Board-room at the Workhouse, in Union-road, Southwark, when forms and full particulars may be had at the Clerk's Office as below, and where a copy of the Contracts may be seen. The stamps on the Contractors' bonds to be provided by the Contractors.—By order of the Vestry,
FREDERICK TRITTON, Vestry Clerk.
49, Bridge House-place, Newington-causeway,
September 16, 1856.

FARRINGDON DRAINAGE.—TENDERS are requested for the CONSTRUCTION of about 1,000 yards of DRAINS in BRICKWORK, in the Tything of Westbrook, in the Parish of Faringdon, Berks, the sections and specifications for which may be seen at the Offices of Mr. JOHN DYKE, Faringdon, between the hours of TWO and SIX, until FRIDAY, the 26th inst. on which day all estimates are to be delivered to Mr. JOHN DYKE, endorsed, "Tender for Westbrook Drainage." The lowest or any Tender will not necessarily be accepted.

METROPOLIS LOCAL MANAGEMENT ACT.—Notice is hereby given, that the Vestry of Paddington are ready to receive TENDERS from parties willing to CONTRACT for the CONSTRUCTION of 1,300 feet of SEWER, more or less, in Third-street, Upper Porchester-street, and Connaught-terrace, together with other Works incident thereto. The Tenders to be sent, sealed, and directed "To the Vestry," and left at the Vestry-hall, Harrow-road, on or before MONDAY, the 6th of OCTOBER next; and persons sending Tenders are requested to be in attendance on the following morning, TUESDAY, at TEN o'clock precisely. Specification, plans, and sections may be seen, and all particulars obtained, from the Surveyor, at the Vestry-hall afore said, between the hours of TEN and TWELVE a.m. The party whose Tender may be accepted, will be required to provide two sureties, in the sum of 250l. for the due performance of the work. The expenses of the contract to be paid by the contractor. The Vestry do not bind themselves to accept the lowest or any Tender.—By order,
FREDR. AVELING, Vestry Clerk.
Paddington, Sept. 17, 1856.

[For remainder of Contracts see next page.

CONTRACTS.

TO SEWER CONTRACTORS and BUILDERS.—The Vestry of the Parish of Cokenwell will, at their Meeting on THURSDAY the 25th instant, at HALF PAST SIX o'clock in the evening, at the Vestry-hall, Upper Rosoman-street, CONTRACT for the BUILDING of a SEWER in Clerkenwell-close, in length about 60 feet, of which the exact specific iron may be seen (by applying to Mr. BEVAN, the Surveyor, from TEN till TWELVE o'clock daily.—Tenders to be inclosed under seal, and addressed to the Vestry-clerk, endorsed outside. None to be received after SIX o'clock on the day above mentioned.—By order,

THOMAS CROMWELL, Clerk of the Vestry.

Sept. 19th, 1856.

TO PIPE-MAKERS and LAYERS, ROADMAKERS, and GENERAL CONTRACTOR.—The Burial Board for the Parish of West Ham, in the county of Essex, are prepared to receive TENDERS from parties willing to contract for the general DRAINAGE of their new BURIAL-GROUND, situate near Forest-lane, in the said parish and county of Essex, and for the following works, viz.:—Roads and roads, with all the necessary gratuities &c. and for the ploughing, sowing, and generally preparing for seeding the surface of the ground. Also for the construction of from 1,700 to 1,800 feet lineal of 12-inch culvert and other works connected therewith. Also for the supply and laying of about 1,000 feet lineal of 24-inch pipe drains, and about 25 chains of 6-inch pipe drains. The general drainage works and roads must be in one Tender: the culvert must also be tendered for separately. Plans, specifications, and quantities may be had on application to the Surveyor, Mr. JAMES HOWELL, 3, Great Winchester-street-buildings, City, between the hours of TEN and FOUR o'clock, and not after. Tenders, addressed to the Board of Works, Romford, Essex, and endorsed "Tender for Making Roads, Drainage &c.," to be delivered to Mr. JOHN SUTTON, Clerk to the Board, at Rose Hall, Stratford, Essex, on or before TWELVE o'clock on MONDAY, the 29th inst. The Board will not be responsible for any Tender not delivered in accordance with this notice. Tenders will be received for the whole or any part of the works.

Dated September 13th, 1856.

SHOREDITCH.—BUILDING GROUND TO LET.—TENDERS will be received till MONDAY, the 6th of OCTOBER next, at the HOUSE of PHILIP ENGLAND, Upholsterer, of No. 11, High-street, Shoreditch, for the Ground with an entrance from the High-street and partly abutting thereon.—Particulars may be obtained of Messrs. R. J. and H. CLUTTON, 9, Whitehall-place, where a plan may be seen.

THE Board of Works for the Limehouse District, comprising the Parish of Lunch use the Hamlet of Ratcliff and the parishes of Shadwell and Wapping, CONTRACT for FLINTS and GRAVEL BALLAST.—Notice is hereby given that the Contractors may obtain forms of Tender at the Office of the Board, White Horse-district, Commercial-road East. GENERAL, the SUPPLY of 200 CUBIC YARDS of the best picked Kent FLINTS, and also for the SUPPLY of 200 CUBIC YARDS of red GRAVEL BALLAST, to be delivered according to the terms of the said contract for the several Avenues in the said Limehouse District. Further particulars may be had on application at the Office of the Board, between the hours of TEN and FOUR. Tenders, sealed and addressed respectively, "Tender for Flints," and "Tender for Gravel Ballast," must be delivered at the said Office, not later than THURSDAY, the 25th instant, before TWELVE o'clock at noon. The Board do not bind themselves to accept the lowest or any Tender. No Tender will be received unless delivered in accordance with the printed form.

THOMAS WAPLES, Clerk of the Limehouse District Board of Works.

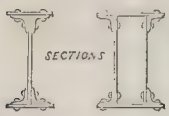
White Horse-street, Commercial-road, Septr. 10th, 1856.

TO BRICKMAKERS, DUST COLLECTORS, and OTHERS.—The Vestry of the Parish of St. Mary Abbots, Kensington, intend to make a New Cemetery in Kensington, and to CONTRACT for the SALE and REMOVAL of the Old-House, Outbuildings, and Premises, and the Land thereto belonging, containing about SEVEN acres, which is at present occupied by Mr. JAMES TEMPLE, and to CONTRACT for the SALE and REMOVAL of the Old-House, Outbuildings, and Premises, and the Land thereto belonging, and also for the Sale of the Crops now growing thereon

ZINC ROOFING, INCLUDING TIMBER OR IRON FRAMEWORK,

IS AS

CHEAP AS SLATES OR GALVANIZED IRON, LIGHTER, AND MORE DURABLE.



Certificates, and Models of various descriptions, may be seen, and Estimates obtained on application to

THE SURVEYOR OF THE VIEILLE MONTAGNE ZINC MINING COMPANY, 12, MANCHESTER BUILDINGS, WESTMINSTER.

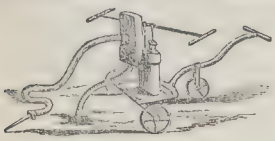
ROOFS CONSTRUCTED UNDER HIS SUPERINTENDENCY GUARANTEED TO REQUIRE NO REPAIRS FOR AT LEAST TEN YEARS.

THE OLD METAL BEING ALWAYS RETAKEN AT HALF-PRICE, RENDERS IT ADVANTAGEOUS FOR ALL TEMPORARY BUILDINGS.

Many roofs covered with zinc thirty-five years ago have never required repairs.

WROUGHT-IRON GIRDERS

For BRIDGES and BUILDINGS,
MANUFACTURED UNDER ADVANTAGEOUS TO STRENGTH.
CAST-IRON GIRDERS for BRIDGES and BUILDINGS.
Castings of every description.



ROLLED WROUGHT-IRON FLITCHES
For TRUSSING BETWEEN TIMBER.

SPIKES, RIVETS, COG NAILS, WROUGHT PITTO SCREWS, BOLTS AND NUTS, BOAT HOOKS, CHAINS, &c.

CONTRACTORS' PLANT, RAILS, EARTH WAGGONS,
And IRON WORK for WOOD WAGGONS, &c.

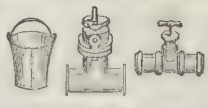
MATTHEW T. SHAW, 64, CANNON-STREET (late with C. J. Mare & Co.)

Such arrangements are made for Despatch and Punctuality that Orders can be executed in a few days.

B. FOWLER, HOLMAN, and CO.

SOLE MANUFACTURERS OF HOLMAN'S PATENT DOUBLE-ACTION CESSPOOL, SEWER FLUSHING, LIQUID MANURE, AND UNIVERSAL FORCE PUMP.

The simplest, cheapest, and best thing of the kind before the public; admirably adapted for the drainage of all kinds of land, and is portable, or can be fixed with perfect ease. Delivers a large quantity at small labour. A really good article, commanding extensive home and foreign sale.



ON SALE AND HIRE,
SINGLE AND DOUBLE PUMPS
IN WROUGHT IRON
TO ANY DEPTH,
FOR BUILDERS, CONTRACTORS, EXCAVATORS, WELL-SINKERS, &c.
Sizes, from 3-inch to 15-inch barrels.

N.B. The Largest Stock in London for hand or steam-power, and for every possible purpose for which a Pump is required upon the largest or smallest scale in Wrought or Cast Iron, Copper, or Brass.

B. FOWLER and CO.'S
FARM and COTTAGE PUMPS, 30s

All sizes and descriptions of Pumps on various improved principles for farm and cottage purposes, Garden Pumps, Lawn Sprinklers, Fountain Pumps, Pasture Troughs, Hydrants, Street Doors, Weight Rods, and Railings, Lavatories, Sink Pumps, Shower and Hot Water Apparatus, Screw presses.

N.B. Every attention paid to country, export, and trade orders. Experienced workmen sent to any part of the Kingdom, to FIX PUMP WORK, HOT-WATER, STEAM, BATH, or DRYING APPARATUS.

BENJAMIN FOWLER & CO. GENERAL ENGINEERS, WHITEFRIARS-STREET, FLEET-ST.

NEW PATENT INVENTIONS FOR STABLE REQUISITES.

AWARDED A PRIZE AT THE PARIS EXHIBITION, AND PATRONISED BY THE ENGLISH AND FRENCH GOVERNMENTS.

COTTAM and HALLEN, of Winsley-street,

Are the original inventors of the PATENT ENAMELLED MANGER, WATER-TROUGH, and WROUGHT IRON RACK, united to an iron top rail and forming one complete and uniform Patent Manger, Hay Rack and Water Trough attached, the hay rack being in the back of the manger, and feeding to or from the back or front. Cottam's new Patent Self-Acting Bolt, of malleable iron, with improved and additional safety apparatus, is strong, light and durable, proof against all tampering, and is recommended to notice. Also, the Patent Saddle and Harness Bracket combined, which can be used with great advantage where space is an object, and the wall is damp.

Improved Harness Hooks, for preserving the shape of the harness, and preventing its cracking. Patent Loose Box Fittings. Cheap and Durable Corn Bins.

Improved Service Pails, with safety covers, Sanitary Traps, and every article for the farm-stable and stable, kept in stock, plain, galvanized, and enamelled. Iron Mates, Fenders, Hurdles &c.

The new illustrated Catalogue for 1856, and estimates sent gratis, upon application to

COTTAM AND HALLEN, 2, WINSLEY-STREET, OXFORD-STREET.

FLAVEL'S PRIZE KITCHENER.

The only Kitchen Range which obtained a Prize Medal and special approbation at the Great Exhibition, 1851.

These Ranges are strongly recommended for their simplicity of construction and their economy and cleanliness in use.

The top forms a Hot-plate, and the open fire removes many of the objections which are felt to close Ranges.

They are made in all sizes, from 3 feet to 18 feet in width, suitable for large or small establishments.

They are admirably adapted for the Cure of Smoky Chimneys.

SOLE AGENTS:
BENHAM AND SONS,
19, WIGMORE-STREET, LONDON;
and at the Crystal Palace, Sydenham.

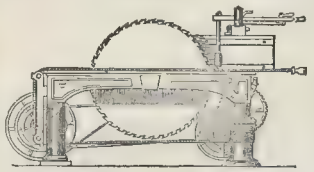
Ornamental hinges adapted for drawing-rooms, &c.; doors fitted with them may be removed and replaced in an instant. Rising and double-acting spring hinges, and superior gate fastenings, at moderate prices None genuine unless marked "Charles Collinge, Patent, Lambeth." Plain and ornamental cast and wrought iron-work, for building and other purposes. Engines, machinery, patent axle trees, sugar-mills, &c.

WOOD-CUTTING MACHINERY,
JOHN M'DOWALL and SONS,
WALKINSHAW FOUNDRY, JOHNSTONE, near Glasgow,
MANUFACTURERS of VERTICAL SAW-FRAMES
(driven by straps),
For cutting balks of timber, from 5 feet on the side down to the smallest deal frame.

Patent vertical saw-frames, of the foregoing dimensions, with steam-power attached; circular cross-cut radial sawing machines; patent reversible ditto; patent horizontal cross-cut sawing machines, for heavy timber; planing machines, for working boards from a ¼ of an inch thick to 6-inch deck planks; revolving planers, for squaring and shaping heavy timbers, as used by ship-builders, &c.; patent curvilinear sawing machines, for circles, sweeps, and straight cutting, well adapted for ship-builders; power mortising and tenoning machines; moulding machines, single and double; veneer mills of all sizes, with all appendages; scale-board machines, for hat-boxes, &c.; patent silent feed motions for saw-frames; and every description of machinery for cutting and shaping timber, all constructed of iron, of the best materials, and first-class workmanship. Mr. M'Dowall has been in the engineering and millwright business for upwards of 30 years, but during the last 24 years he has directed his attention particularly to the manufacture of wood-cutting machinery, as evidenced by the numerous patents he has obtained for its improvement, and by the extensive orders his firm has been favoured with from the British and other European Governments and private establishments in almost all parts of the world; and from their large and commodious premises, and first-class plant made for every department of the work without regard to cost, the largest contracts can be executed with a regularity, accuracy, and despatch, which cannot be exceeded by any other firm in Europe.—Applications as above for further particulars, will be promptly attended to.



NEW PATENT MACHINE for MORTISING and TENONING HARD or SOFT WOOD and BORING WOOD or IRON.

House and Coach Builders, Joiners, Cabinetmakers, and others, doing similar work, are invited to call at the Patentees', POWIS, JAMES, and Co. Wholesale Builders and Cabinet Makers, Ironmongery Establishment, 58, Watling-street, City, and see in action this very simple, powerful, and expeditious machine, which is the only one yet brought out, for performing these three separate kinds of work by one machine; and as it is self-feeding, it does not require any skill or care in using like the older inventions introduced. It can either be worked by a boy, or made to go by steam power.

P.S. Steam Engines and Machinery contracted for.

MACHINERY for SAWING, PLANING, MOULDING, &c.

SAMUEL WORSSAM and CO. beg to call the attention of Contractors, Shipbuilders, proprietors of Saw-Mills, and others, to their improved Inventions and Adaptations in Saw Frames and Benches, Chain Planing Machines, Endless Saw Frames, and all other kinds of Machines, for Sawing, Planing, Grooving, and Moulding Wood. They have now in hand machinery, either wholly or partly made, so that they can at all times on short notice supply them. S. W. and CO. beg to state that they have hitherto confined their attentions to this sort of machinery, and have had the honour of supplying some of the most distinguished companies, ship builders, and contractors in the world with their machines, for home and foreign use. One of their Saw Benches, and also a smaller one, with Boring Apparatus, may be seen at the Machinery Department, Crystal Palace.—A descriptive Catalogue, with Drawings, may be had on application to SAMUEL WORSSAM and CO. Engineers, &c. King's-road, Chelsea, London

TO ENGINEERS, MECHANICS, PRINTERS, AMATEURS, and OTHERS.—The Proprietor of PARAGON WORKS, near Queensferry, nine miles from Edinburgh, purposes to have a SALE of NEW ENGINES, TOOLS, and MACHINES, to take place in the month of OCTOBER next, and which will comprise, amongst various others, the following:—Steam Engines, Slide and Screw Cutting Lathe, Planing Machines, Vertical Boring Machines and Drills, Nut and Cross-Cut Shaping Machine, Screwing Machines, Double-Form Platen Printing Machine, Columbian and Albion Printing-Presses, a beautiful (Amateur's) Lathe, by Holtzapffel, with Eccentric and Oval Chucks and Overhead Drilling Apparatus, and a number of other Tools and Machines; and as nothing but first-class work, containing all the most recent improvements, is turned out at Paragon Works, the above are well worth the attention of all parties requiring the like. Details and descriptive catalogues will be sent to parties applying to the Manager of Paragon Works, near Queensferry, N.B. when will forward them by post when printed, a few days hence.

TO ARCHITECTS, BUILDERS, AND THE TRADE.
PATENT PLUMBIC ZINC.
GREAT REDUCTION IN PRICE.
PLUMBIC ZINC is a perfect combination of Lead and Zinc, and not requiring to be more than one-fourth or one-fifth as thick as Sheet Lead, is consequently very much cheaper than that material, and at the reduced price costs but little more than Sheet Zinc.

No. 11 gauge weighs about 18 oz. per foot super.				
12	"	20	"	
13	"	23	"	
14	"	26	"	

Full particulars and the reduced price sent by post on application to
A. MOREWOOD and CO. DOWGATE-DOCK, LONDON, to whom all letters must be addressed.

TO MANUFACTURING CHEMISTS, PLUMBERS, BUILDERS, &c.

ANDREW CLARK and COMPANY, PLUMBERS,
THE BEAR GARDEN LEAD WORKS, SOUTHWARK,
Sole Manufacturers of Delbruck's Patent Autogenous Soldering Apparatus, invite the attention of Manufacturing Chemists to their Patent method of
UNITING LEAD TO LEAD WITHOUT SOLDER.
Leaden Chambers, or any leaden vessels, made or repaired by this process, making them complete, without the introduction of any foreign metal.
PLUMBERS and BUILDERS can be SUPPLIED with SHEET LEAD and PIPE, cut to any dimensions, and EXCHANGED for OLD LEAD, on the LOWEST TERMS.

TO ARCHITECTS, BUILDERS, CONTRACTORS, AND OTHER CONSUMERS OF GLASS.

HARTLEY'S PATENT ROUGH PLATE GLASS,

1-8th of an inch thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th or 4 lbs. is now universally used for

RIDGE AND FURROW ROOFS, GREENHOUSES, RAILWAY STATIONS, MILLS, MARKET HALLS, BATHS AND WASH-HOUSES, FACTORIES, WORKSHOPS, SHIP-BUILDING SHEDS, AND OTHER EXTENSIVE BUILDINGS.

By a carefully prepared Estimate, it has been ascertained that FOUR-FIFTHS of the ROUGH PLATE, or non-transparent Glass, consumed in the United Kingdom in 1854 was manufactured by HARTLEY'S PATENT—thus affording the most incontestable evidence of its superiority over every other article of the kind, and as being the only description of Glass suitable for the purposes above named. It combines size and strength with economy of cost, and is manufactured in sizes expressly for RIDGE and FURROW ROOFS, giving a SPAN of TWELVE FEET, at a price not exceeding, weight for weight, that of Common Crown Glass. Its non-transparency renders BLINDS UNNECESSARY, and no scorching occurs in Greenhouses glazed with it; hence the preference given to this Glass for all Horticultural purposes.

For further particulars, apply to

JAMES HARTLEY AND CO. SUNDERLAND; AND PURFLEET WHARF, EARL-STREET, BLACKFRIARS, LONDON.

Sole Manufacturers of Lockhead's Patent Perforated Glass for Ventilation.

*** *Hartley and Co.'s Glass Tariff Newspaper will be forwarded gratis, on application.*

FACING FOR BUILDINGS COMPANY—TAYLOR'S PATENT.

BUILDINGS PERFECTLY RESISTANT TO WET WITHOUT ADDITIONAL EXPENSE, OR THE USE OF COMPO,

REQUIRING THE CONSTANT EXPENSE OF PAINTING. EXTERNAL WALLS FACED WITH AN INDESTRUCTIBLE MATERIAL.

STONE-FACED BUILDINGS AT LITTLE MORE COST THAN CEMENT.

No necessity for Iron Cramps and Bond-stones and the Stone Ashlar never injuriously weighted by the settlement of the Mortar-joints of the inside Brickwork. The INSIDE of CHURCHES and OTHER BUILDINGS FACED WITH STONE instead of Plastering. Also Dining halls, Lobbies, Staircases, &c. of Private Residences. It can be had ready for fixing from the quarries at a small cost for carriage, or prepared at home. Can be used with the ordinary Bricks of any locality, and by the ordinary workman. The CHURCH faced inside and outside in this manner, and the other Buildings at SPRING GROVE HOUNSLOW, and elsewhere, can be inspected, and all particulars obtained, of

Mr. JOHN TAYLOR, ARCHITECT, OFFICES OF THE COMPANY, 40, KING-STREET, CORNER OF CHEAPSIDE.

THE SEVRES GLASS COMPANY.

JOHN WARNER and SONS, Patentees of IMPROVEMENTS in the MANUFACTURE of LARGE BELLS

J. W. & SONS having of late years devoted much time and study to the long neglected art of Bell Casting, have recently invented and patented a new process connected therewith, by which they are enabled to manufacture Bells of any size, note, or weight, of superior tone, truer in form, and at less cost than has heretofore been accomplished.

Bells for Churches, Chapels, Colleges, Schools, Turret Clocks, &c. cast for any size, note, weight, singly or in peals.

TUNED BY MACHINERY.

Stocked and wheeled ready for fixing. Old Bells recast or taken in exchange.

MUSICAL HAND-BELLS tuned to the Chromatic Scale, with improved Clappers, and passed on a new system, which give superior tone and facility for ringing.

GLASS PAINTING.—Messrs. HEATON and BUTLER (late of 24, Albany-street, Regent's-park), beg to call attention to their GRISAILLE DESIGNS for Ornamental and Clerestory Windows, produced at an unusually moderate cost, although painted by hand. Designs, with estimate, forwarded upon application.—32, Glouce-ter-place, New-road (opposite Circus-street).

J. ROBERTS, WOOD LETTERS FOR SHOP FRONTS, &c. 3, BISHOP'S WALK, LAMBETH. Two Minutes' Walk from Lambeth Pier. Established 30 years.

LLOYD'S MARBLE WHARF, Thames-bank, Pimlico, adjoining Vauxhall-bridge.—Italian Statuary, Veined, Sicilian, Dove, Sienna, and other Marbles, for Sale, at import prices. A resident manager on the wharf at all hours.

BUILDERS! ARCHITECTS! AND MASONS!

MARBLE.—The Italian Marble Company call the particular attention of Builders, Architects, Sculptors, and Masons to their PRESENT low prices, viz:—
Veins, in blocks of ordinary dimensions, 8s. 6d. per foot cube.
Sicilian " " 6s. 6d.
An inspection of their well-assorted stock is solicited, at "The Depôt," Bridge-wharf, Millbank, adjoining Vauxhall-bridge.—Apply only to Mr. BAXTER, Wharf Foreman.
WILLIAM W. BONNIN, Secretary.

MARBLE WORKS by PATENT MACHINERY, Commercial-road, Pimlico, London.
THOMAS JACKSON begs to draw the attention of the public to the most extensive stock of Marble Chimney-Pieces in the Metropolis; consisting of a selection of upwards of two hundred, and manufactured by steam power from the finest Italian and other marble, and with that careful attention to the details and finish so necessary in good marble work. The Stock consists of elegant Drawing-Room Chimney-Pieces in Statuary Marble; bold, massive Chimney-Pieces, in Black, Black and Gold, Bardilla, Sienna, Verd Antique, Brocatella, Dove, St. Ann's, and Serpentine Marble, suitable for Dining-Rooms, Libraries, Vestibules, and Entrance-Halls; and a great variety of others in Veined, San Juan, Emperor's Red and Amber Marble, for Boudoirs, Breakfast-Rooms, best and secondary Bed-Rooms, &c.; also, Monuments, Tombs, Tablets, and Pedestals for Busts and Statues, and Slabs for Cabinet Work, &c.; the whole executed from the most classical designs, and in all the varieties of the finest Italian and British Marble at the lowest remunerative prices.

MARBLE CHIMNEY-PIECES.—The nobility and gentry of the United Kingdom who are building or refitting their mansions are respectfully invited to inspect the most Extensive Collection of MARBLE CHIMNEY-PIECES lately imported from the Continent. They comprise Statuary, Giallo di Sienna, Vert Rouge, Dove, Black and Gold, Rouge de Belmont, Bardiglio, and other choice foreign marbles; and are designed with great taste, and executed by first-class artists.—On sale, in the show rooms of Messrs. EVANS, SON, and CO. King William-street, London-bridge.

PURBECK MARBLE can be had of Mr. JAS. VOSS, Corfe Castle, Dorset.

MARBLE CHIMNEY-PIECES, and every other description of Marble work, supplied to Architects, Builders, and the trade, at a lower price than their attempted imitation in slate, manufactured by steam and water power, by the London and Continental Marble Company.—Office and depôt in England, 3, Crooked-lane, London-bridge. R. B. WYATT, Manager.—Estimates given.

BATH STONE DEPOT, BOX STATION. ROBERT STRONG, STONE MERCHANT, Box, Wilts.—Box Ground Stone, Scaliett Block Ashlar, Rangework, &c. &c. Supplied direct from the Quarries; also every description of Stone-work for building purposes, both plain and ornamental, prepared ready for fixing, and forwarded to any part of the Kingdom. Vases in elegant variety always on view; Urns, Fountains, Chimney-pieces, Tombs, &c. &c.
A Capital Travelling Crane for Sale.

BRAMLEY FALL! BRAMLEY FALL! On account of greater facilities than possessed by any one else, TRICKETT and PERKINS are prepared to supply in any quantity BRAMLEY FALL STONE, at greatly reduced prices, having opened the extensive quarries in the Hawkesworth Cutting, on the North-Eastern Railway, near Horsforth. The stone is of the same quality as the well-known Old Bramley Fall and Horsforth Quarries, but has the advantage of being of a lighter and more uniform colour. The North-Eastern Railway Company have put sidings in on both sides of the railway. Powerful cranes are fixed, so that the stone can be got to any size, and the stone being loaded in the quarries on the railway-trucks, can be forwarded the same day to any part of the kingdom, or supplied in London river via Selby or Hull, in any quantity.—For particulars apply to JOHN TRICKETT, Stone Merchant, Headingley, near Leeds, or to SAMUEL TRICKETT, Victoria Stone Wharf, Isle of Dogs, London.

RANSOME'S SILICIOUS STONE.—All kinds of ARCHITECTURAL EMBELLISHMENTS executed in this beautiful and indestructible material, at prices not exceeding the ordinary cements. Full particulars furnished on application to Mr. FRED. RANSOME, Whitehall-wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich.

TO CONTRACTORS AND OTHERS.

YORKSHIRE PAVINGS, LANDINGS, STEPS, COPINGS, CURBS, SILLS, SINKS, and CHANNELS; Hore-hill, Robin Hood, Park Springs, and Gayley, in Blocks, Headstones, or Slabs; Purbeck Paving, Sinks, Curbs, Rickstones, Pitchers, and Squares; Caithness Flags, Firestone, Newcastle and Bilston Grindstones; Portland Stone in Blocks, Landings, Slabs, &c.; Darley Dale, Caen Stone, Bramley Fall, Bath, Huddlestone, Park-wood, and other Block Stones. Valentia Slate Slabs, Bangor Slates, Cornish, Aberdeen, Guernsey, and other Granites; Marble, in Block and Slabs, supplied from the Wharfs, Millbank-street, City Basin, and Deptford; also direct from the quarries by vessel or rail.—Address, FREEMAN'S WHARF, 37, Millbank-street, Westminster.

TO CONTRACTORS and PROPRIETORS of SOLID ROCK.—Since the invention of HUNTER'S PATENT STONE PLANING MACHINE, nineteen of which are presently at work in Forfarshire, several unsuccessful attempts have been made to construct a Machine for Ashlar Dressing, &c. Every one has failed. J. and S. HUNTER feel bound to direct attention to their PATENT (now in practical operation both in England and Scotland). The machinery is so constructed that it will receive a block, however rough, and cut it up to facing both sides; it will also face one side without cutting on both sides. The machine is well adapted for large contracts, such as the construction of docks.

GREEN MOOR STONE WHARF.—BROWN and BOOTH, 42, Bankside, Southwark, beg to invite Builders, Architects, Masons, and the Trade, to the stock of STONE of all kinds; viz. Portland, Ganeby, Harehill York Paving, Landings, &c. &c.; the Green Moor stone in blocks, landings, quarry-worked steps, sinks, copings, cills, &c. &c. Sawn slab and headstones in Green Moor, Harehill, Robin Hood. The best attention given to all orders, and price-lists sent on application—at such prices to meet the wishes of all. The nearest wharf to the City and Surrey side of the water.

CAEN and AUBIGNY STONE.—P. FOUCARD, Stone Merchant and Quarryman. Cargoes shipped to order from Caen to any port. Contracts taken for any quantities. Depôts: Granite Wharf, East Greenwich; Lett's Wharf, Waterloo-bridge. Office: 246, High-street, Southwark, near the Townhall.

WELSH GRANITE.—The Welsh Granite Company, Carnarvon, supplies Pitching or Paving Sets of this Material to order. The Sets, which have for several years been extensively used in Manchester, Bristol, Leeds, and other large towns, combine in a higher degree than any others, the qualities of roughness in wear and durability. The stone is also well adapted for foundation courses, plinths, &c. for public buildings and for mill-stones.

GATES and GEORGE,
CAEN, AURIGNY, and GENERAL STONE MERCHANTS
CAEN WHARF, MOTHERHITHE.
LONDON.

GRANITE.—King William and Nelson Monuments, Plinth and Steps of the Royal Exchange, and Terrace of the Royal Pavilion, Brighton, are built of Cornish granite from Messrs. Freeman's Quarries, Liskeard Cornwall. For terms apply to Mr. C. Hussey, Hayter Granite Office, 4 Millbank row, Westmin-ter.

GRANITE.—The Cheesewring Granite Company, Liskeard Cornwall.
London Agents—Messrs. TAYLOR, Sons, Granite-street, Messrs. FREEMAN, London.
This Granite has been used for the New Westminster Bridge.

MARKET-WHARF, REGENT'S-PARK-BASIN, WEST END, Hertford, for Yellow Stocks, Pressed Bricks, Lime, Cement, Plaster, Tiles, Laths, and Fire Goods, which are delivered by the Regent's Canal, or by road, to every other description of stone, at JOHN KNIGHT and SONS' Manufactory, Hertford. Chimney-pieces, slab for hearths, 4l. per foot sup.; slab for chimney-pieces 4l. per foot sup.; 8 by 8 windowsills, 6l. per foot run; 14 by 3 coping, 5l. per foot run. Estimates and designs forwarded. Terms cash.

JOHN BAZLEY WHITE and BROTHERS, 5, WILLIAM-STREET, WESTMINSTER.
Marble of all kinds and of best quality, in block and slab. Marble mantels &c.

BATH STONE, of the very best quality.
RANDELL and SAUNDERS, QUARRY-LANE, BOX, NEAR BATH.
LONDON.
Lists of prices at the Quarries and Depôts, and account for transmission, may be had on application at Bath Stone Depôt, Pimlico.

BANGOR WHARF, King's-road-bridge, Cambridge-town.—SPRINGFIELD and OLIVER, late W. Roberts, Jun., and Co., beg to inform Builders that they have a large stock of Bangor slates, laths, plaster, Roman, Portland, and Roman cements, bricks, tiles, pipes, &c., which they can deliver at the cheapest rates.

QUARRY-WORKED STONE.—Architects, Builders, and others may effect a saving of 20 per cent. in the cost by ordering steps, plinths, term bases, cills, arches, imposts, cornices, or any stone-work in Bath stone, moulded or plain, &c., from the Quarries.
Experienced foremen are kept, and the stone is clean-worked and carefully packed or stowed and delivered direct in one journey by road to any railway station in London, or to any part of the country.
The Quarries are within 2 miles of the Box Station, on the Great Western Railway.
Prices and estimates forwarded by return of post on application to JOHN CRICKLEY, Box, near Bath.

AMERICAN OILSTONES, superior to all others, are sold by the Sole Importer, JOSEPH ROBINSON, 7, Mark-lane, London, E.C., in boxes containing 1lb., 2lb., 3lb., 4lb., 5lb., 6lb., 7lb., 8lb., 9lb., 10lb., 11lb., 12lb., 13lb., 14lb., 15lb., 16lb., 17lb., 18lb., 19lb., 20lb., 21lb., 22lb., 23lb., 24lb., 25lb., 26lb., 27lb., 28lb., 29lb., 30lb., 31lb., 32lb., 33lb., 34lb., 35lb., 36lb., 37lb., 38lb., SLATE.—All assortment of the best BANGOR ROOFING SLATE ON SALE at Bridge-wharf Millbank.—Apply to Mr. GEORGE BAXTER, Foreman.

VALENTIA SLATE SLABS.—The Valentia Slab Company invite attention to their Slabs now in use for the purposes of Public Buildings, &c. They have been used at the British Museum, National Gallery Bethlem Hospital, various Lunatic Asylums, the Ordnance Works Model Prison, Pentonville, and other Penitentiaries, Mullins Floors in Bedfordshire and Hertfordshire, Breweries, the Race Stand at Epsom, Greenwood Mortuaries, and are used throughout large quantities by Messrs. FREEMAN, Mitchelstown; and at Messrs. Leaby's Bewley-road Works, Dublin.

PARIS EXHIBITION.—ENAMELLED SLATE.—TWO FIRST-CLASS MEDALS to Mr. MAGNUS is the only work of the kind that has received the honour of two medals. Mr. MAGNUS has the honour to inform the Nobility, Gentry, and the Public generally, that he has opened Show-Rooms at 149, Strand, for the exhibition of his Enamelled Slate, which has been pronounced by the Jurors of the Paris Exhibition to be the most beautiful material for the purposes of internal and external decoration, and the highest class of public buildings, as well as for other productions that can at all compete with it. It is applicable to a variety of useful and ornamental articles, for numerous of which he solicits an early inspection. The material is impervious to wet, and ornamental slates for all apartments; plain and exquisitely decorated, suitable for dining-rooms, drawing-rooms, conservatories, halls, and other places, are constantly on view. Specimens may be had on application at the Show-Rooms, or by letter addressed to Mr. MAGNUS, 149, Strand, London.
N.B. Plain slate worked and executed from a single article to the most extensive order, at the shortest notice.

SLATE.—The Bangor Royal Slate Company have now on hand a LARGE ASSORTMENT of ROOFING SLATES, of the best quality, which they are prepared to deliver at moderate prices, for immediate or future delivery, at the nearest railway station to Bangor. Apply to Mr EDWARDS, Manager, Bangor Slate Depôt, Lambeth.

ROOFING SLATES, SLATE CISTERNS, and every description of slate Slab-work.—T. B. HANNAFORD, Slate Merchant, begs to inform Builders that he does not employ any middlemen in his business, but imports the slates direct from the quarries, thereby enabling him to offer the above goods at prices considerably lower than the usual London prices. Slates delivered on the Thames.

O. M'CARTHY, CARMAN, and SAND and CEMENT MERCHANT, Whitefriars Wharf, Whitefriars, Fleet-street, City. Sand, from above or below bridge, delivered at 2s. 6d. per yard. Ballast or rubbish removed by the barge. Paper, sticks, rope, and old canvas. Old rubbish delivered per barge, in any quantity, alongside the Thames.

ASPHALTE.—GERVASE FOOTTIT and CO., PATENTEES of ASPHALTE WORKS, ROTHERHITHE, LONDON. Established 1834.—TRINIDAD, SEYSSEL, and BRITISH ASPHALTES, manufactured by Steam power into damp-proof courses of any required thickness. Information for using forwarded with material. Post-office orders or references to London promptly attended to. Estimates given for every kind of the above work.

ASPHALTE, FOREIGN and BRITISH, for FLAT ROOFING and every description of PAVING, especially in damp situations.
1½d. PER SQUARE YARD.
Country Buyers supplied, with Asphalte for footings and barn floors with instructions for laying.
Apply to JOHN PHILLIPSON, Patentee and Limmer Asphalte Manufacturer, 14, Fish-street-hill, London.
NB Importer of the PURE ROCK ASPHALTE, from the LIMMER Mines in Hanover.

Specimens may be had on application. Communications addressed to CAMELOT, 19, Gower-street, Bedford-square, will be immediately attended to. Sketches of the Builder's Prize Design for the Crystal Palace, and other competitions, coloured in a few days.

MATHEMATICAL DRAWING INSTRUMENTS. JOHN ARCHBUTT, 20, Westminster-Bridge-road, near Astley's Theatre, begs to call the attention of Architects, Engineers, Students, &c., to his Stock of Instruments, which he can confidently say for quality of workmanship, finish, and accuracy, are unequalled by any other house in London. The following are a few of the articles he can recommend, and which he will be found 25 per cent. lower than any other house for articles of similar quality and workmanship. Rules, scales, &c., of every description. An illustrated price list sent immediately forwarded, free, on application.
N.B. A few New and Second-hand Levels and Theodolites always for Sale.

MATHEMATICAL DRAWING INSTRUMENT.—A new and enlarged edition of this illustrated catalogue will be forwarded, post free, on application to JOHN ARCHBUTT, 20, Westminster-Bridge-road, near Astley's Theatre, London. Architects, engineers, and others, who have not received the last edition, may be supplied with the new one by forwarding their address, and two postage stamps, to JOHN ARCHBUTT, 20, Westminster-Bridge-road, near Astley's Theatre, London.

DUMPY LEVELS, Six Guineas each, complete, with case and tripods.—Apply to JOHN ARCHBUTT, 20, Westminster-Bridge-road, Lambeth, near Astley's Theatre.

TO ARCHITECTS AND OTHERS.
MR. EDWARD L. PARAIRE is desirous of Meeting Gentlemen who require COLOURED ARCHITECTURAL DRAWINGS, Executed, Restored, from Rough Pencil Sketches or Outlines of same, neatly coloured, with background, on terms that will insure approval. Temporary assistance given in getting up Plans, Elevations, Sections, Details, and Working Drawings.—Mr. E. L. makes a consideration in his charge where work is taken to his residence at Hull.
Address, 8, Rathbone-place.

The Builder.

VOL. XIV.—No. 711.

HOSPITALS, more than any other buildings, demand the most careful arrangements—not merely for the ample supply of air, but to ensure that the air so supplied be *pure*. So little has this been attended to in days gone by that there are many hospitals in this country where, as soon as the wards get full, fevers and other disorders appear, and it is difficult to effect a cure in many cases which, under other circumstances, would be overcome without difficulty. A leading Edinburgh professor, in some recently published "Memoirs," says,—"I have often stated and taught that, if our present medical, surgical, and obstetric hospitals were changed, from being crowded palaces with a layer of sick in each flat, into villages or cottages with one, or at most two, patients in each room, a great saving of human life would be effected. And if the village were constructed of iron (as is now sometimes done for other purposes), instead of brick or stone, it could be taken down and rebuilt every few years; a matter, apparently, of much moment in hospital hygiene. Besides, the value of the material would not greatly deteriorate from use: the principal outlay would be in the first cost of it. It could be erected in any vacant space or spaces of ground, within or around a city, that chanced to be unoccupied; and, in cases of epidemics, the accommodation could always be at once and readily increased."

There is value in the hint, but it is only in exceptional cases that it could be resorted to. Hospitals must still be erected, and we must take care that every available means be used to render them healthful and fit for their purpose. Some of our military hospitals are disgraceful to the scientific character of the country, and it never fell to our lot to visit any in which there were not obvious errors that might have been avoided. With respect to the vital importance of fresh air for the maintenance of life, it would really seem as if the world were not to be convinced on this head: you may remind them of the black-hole-of-Calcutta story; of the canary-bird that dies in a night hung up under your bed-curtains; or of the 250 Coolies who, in a few hours, were killed a year or so ago in an American vessel, by having been forced under hatches. It is all of no use: the facts are assented to: the necessity of plenty of air is fully admitted; and then, on the very first occasion, the assenters proceed to act as if they had never heard of such a necessity, or did not believe in it if they had.

We have long fought for fresh air,—fresh air everywhere. What we would now more especially speak of is the arrangement of hospitals for the sick and wounded,—a subject the more urgent because of the large sums about to be spent in the provision of additional structures of that kind.

Mr. John Robertson, surgeon, of Manchester, in a paper read recently at the Statistical Society of that town, says,—

"I have long thought that in constructing hospitals we have been in the habit of confounding together two things widely different, namely, *sick wards and dormitories*; wards, where the sick and wounded lie continuously throughout the day and night, with dormitories occupied by the healthy for only eight or nine hours in the twenty-four; — of confounding wards — where cubic air space, though highly important, is a secondary consideration to the getting rid of fœtid and pestiferous exhalations by a continual renewal of the atmosphere—with dormitories, in which ample cubic air space is all that is required. It has been owing to ignorance or inattention to this essential difference between wards for the sick and dormitories for the healthy, that we have few hospitals in England that are not insalubrious whenever they chance to be crowded; and which, when crowded with such cases as burns, compound fractures, and extensive ulcers, are often the abodes of death, occurring in forms most humbling and mortifying to the pride of surgical science; since the surgeon, in such circumstances, is aware that the poor sufferers have been carried to a public institution to their destruction; and that had they been treated by him in their own homes, howsoever humble these might be, the chances of recovery would have been greater."

Mr. Robertson refers more than once to this prime defect in the great majority of our hospitals, that of their being constructed after the plan of a hotel, well suited to have lodged persons in a state of health, but incapable of the proper degree of ventilation when crowded with sick, especially those of a surgical class. There is, moreover, another evil attaching to this plan of building, distinct from the other—the creation of what is justly denominated *an hospital atmosphere*, which arises from the wards communicating with one another by passages and stairs. It is owing to this kind of intercommunication that, if a foul state of the air happen in only a single ward, such foul air spreads and speedily pollutes the entire building. "In a few of our hospitals," says he, "the plan of construction is good; in the majority, bad; but in not one of them that I have seen, is the plan such as to render impossible the formation of an *hospital atmosphere*; yet this all-important object has been attained on the continent in several instances, where we have a plan of construction at once ingenious and perfectly successful,—a plan that, when first seen and understood, never fails to excite feelings of pleasure and admiration. I allude, more particularly, to the Bordeaux Hospital, the most attractive, altogether, that I have examined; although it must be admitted that the Saint John's Hospital, Brussels, the new Lariboisaire and the Beaujon Hospitals, Paris, are built after the same plan, and are, perhaps, not very much inferior."

Annexed we give the ground-plan of the Bordeaux hospital, with some references to explain the appropriation of the several parts. Passing into the hospital by the centre gateway, the visitor beholds a beautiful court, for the most part planted with evergreens and flowering shrubs; and, on the two sides thereof, facing each other, a succession of pavilions or tiers of building, standing parallel, and having the ends towards the square. The tiers of building are separated from each other by a flower garden, and in these tiers are the sick-wards, each ward isolated from the rest. You enter the sick-ward from the open air, under the cover of an arcade, which runs along the ends of the different tiers; and, when you return, it is by the same door through which you entered: there is no intercommunication by doors or passages between any of the wards. When in a ward you behold a spacious, lofty, cheerful apartment, 140 feet in length, fitted to contain forty beds, and having tall windows on opposite sides facing each other. The wards in the upper stories are entered, in the same manner as those beneath, out of an open arcade; and in every ward when you look out of a window it is into a garden, there being, as before mentioned, a garden between each pair of tiers of building. In one word—for this is the important point,—every ward is in itself a separate hospital, and the foul air from one ward cannot enter into another, because, by the windows, it passes and is dispersed into the external atmosphere.
